OF MEDICINE
SEP -6 1939
LIBRARY

Index—California and Western Medicine, Volume 50

January to June, 1939

INDEX ARRANGEMENT

Sequence of Subheads in Index

This index is arranged under the following headings:

I. Authors.
II. Subjects—Titles of papers.
III. Editorials.
IV. Editorial Comment articles.
V. Bedside Medicine articles.
VI. Medical History articles.
VII. Miscellany columns.
VIII. California Medical Association.
  (a) General.
  (b) Component County Societies.
  (c) Department of Public Relations.
  (d) Woman's Auxiliary.
IX. Deceased members.
X. Nevada State Medical Association.
XI. Book Reviews.
XII. Report of Medical Examiners.

* * *

Key to Abbreviations in This Index

Or.—Original Article.
C. R.—Case Report.
B. M.—Bedside Medicine.
Ed.—Editorial.
E. C.—Editorial Comment.
C. N.—Clinical Notes.
L. M. H.—Lure of Medical History.
Sup.—Supplement (by month).

NEW YORK ACADEMY OF MEDICINE

Index to Pages, Volume 50, California and Western Medicine, January to June, 1939

Date of Issue	No. of Pages
January	1– 80
February	81–168
March	169–248
Supplement:	
Membership Roster, Year 1938	1– 24
April	249–320
Supplement:	
Annual Session Program, Part I	1– 36
Preconvention Bulletin, Part II	37– 54
May	321–392
June	393–464

* * *

Two Volumes Yearly

California and Western Medicine is issued annually in two volumes: the first from January to June, inclusive; and the second from July to December, inclusive.

Attached to the current volume (Volume 50) are two supplements, as follows: March issue, Supplement on Membership Roster (1938); April issue, Supplement on Annual Session Program and the Preconvention Bulletin.

American Medical Association Quarterly Cumulative Index

Members who wish to consult a general medical index are referred to the Quarterly Cumulative Index of the American Medical Association.

I

AUTHORS—INDEX

A

PAGE

Abraham, Samuel V.—Refraction (B. M.) 423
Anderson, C. Russell, and Wilson, Warren A.—Active Interstitial Keratitis of Late Prenatal Syphilis: Its Treatment (Or.) 196
Ayres, Samuel, Jr.:
  Current Quackery (B. M.) 128
  Herpes Zoster (B. M.) 364

B

Bacon, Samuel K., and Rusche, Carl F.—Congenital Renal Anomalies (Or.) 344
Beach, E. W.—Enuresis (B. M.) 283
Behneman, H. M. F.—Current Quackery (B. M.) 130
Benninghoven, Carl D.—Subperiosteal Calcification and Bone Changes in Early Scurvy (C. R.) 278
Bernstein, Abraham:
  A Plea for Conservative Obstetrics (Or.) 118
  The Pelvic Floor (E. C.) 326
Bird, Mira S., Field, Hazel E., and Stone, Florence G.—Vitamins A, B_1, B_2, and D: Effects of Daily Administration of Concentrates (C. N.) 125
Boyle, S. F.—Refraction (B. M.) 422
Briden, V. S., and Fitzgibbon, C. C.—Extreme Hyperexia and Prolonged Convulsion (C. R.) 360
Bumpus, H. C., Jr.—Urinary Tract Infections (Or.):
  Part I 254
  Part II 351
Burch, B. O., and Mack, Clifford W.—Insulin Shock Therapy in Dementia Praecox: A Report of a Series of Cases (Or.) 339
Burger, Thomas O., and Torbert, Harold C.—Problems in the Diagnosis of Acute Appendicitis (Or.) 7
Burlingame, R. W., Righetti, Ethel, and Geiger, J. C. —Gonorrheal Vaginitis in Children (C. N.) 358
Burlingame, R. W., Welke, Hilda F., and Geiger, J. C.—Diphtheria (Or.) 413

C

Card, Thomas A.—Tuberculous Appendicitis (Or.) 176
Carter, Ray A.—Miliary Lesions of the Lung, Roentgenographically Considered (Or.) 94
Caskey, Charles R.—Pruritus Ani (Or.) 14
Chambers, Stanley O.—Herpes Zoster (B. M.) 365
Cragin, Robert B., and Dougan, Stanley—Actinomycosis with Subsequent Extension and Abscess Formation (C. R.) 360
Cunha, Felix, and Kellogg, Frederick—Dermatomyositis (Or.) 337

D

Delprat, G. D., and Weeks, Alanson—Experiences with Colectomy (Or.) 87
Diefenbach, W. E., and Yuskis, Anton S.—Allergy to Liver Extract (C. R.) 28
Dougan, Stanley, and Cragin, Robert B.—Actinomycosis with Subsequent Extension and Abscess Formation (C. R.) 360
Doughty, J. F.—Chancroidal Bubo Cured by Sulfanilamide (C. R.) 361
Downing, F. Harold—A Transfixation Pin for Cancellous Bone (C. R.) 277

E

Evans, George H.—Plague Epidemics in San Francisco: Historical Notes (L. M. H.), Part III 24

F

PAGE

Field, Hazel E., Stone, Florence G., and Bird, Mira S. —Vitamins A, B_1, B_2, and D: Effects of Daily Administration of Concentrates (C. N.) 125
Fitzgibbon, C. C., and Briden, V. S.—Extreme Hyperexia and Prolonged Convulsion (C. R.) 360
Fitzgibbon, Paul, and Silver, Barney—Toxic Necrosis of Liver Following Use of Sulfanilamide (C. R.) 123
Fricke, John W., and Kay, Willard E.—Sobisminol: Its Oral Administration (Or.) 348
Friedlander, R. D., and Shepardson, H. Clare—Zinc Insulin Crystals (Crystalline Insulin) (E. C.) 252

G

Geiger, J. C., Burlingame, R. W., and Righetti, Ethel —Gonorrheal Vaginitis in Children (C. N.) 358
Geiger, J. C., Burlingame, R. W., and Welke, Hilda F.—Diphtheria (Or.) 413
Geiger, J. C., and Ragan, W. J.—Food Poisoning Apparently Due to Hollandaise Sauce (C. N.) 28
Glass, Samuel J.—The Adrenogenital Syndrome (E. C.) 398
Goodman, Max J.—Cutaneous Histamin Reaction in Diagnosis of Hysteria (C. R.) 419
Guttentag, Otto E.—The Phrase, "Art and Science of Medicine" (E. C.) 86

H

Hamilton, Paul, Stafford, H. E., and Shaw, E. B.—Immunization Procedures (Or.) 112
Harrington, Stuart W.—Diaphragmatic Hernia: Results of Surgical Treatment in 210 Cases (Or.). Part I 349
Harris, David—Medicine in Colonial America (L. M. H.)
  Part I 355
  Part II 415
Herrmann, Walter W., and Kruse, Fred H.—Hunner's Ulcer as an Unsuspected Cause of Gastro-Intestinal Symptoms (C. R.) 363
Holder, Hall G.—Selective Anesthetic Program: Its Desirability (Or.) 190
Huffman, L. Dale—Renal Function in the Aged (Or.) 16

I

Ingels, Arne, Ely—Scabies (Or.) 265
Irvine, A. Ray—Refraction (B. M.) 421

J

Jellen, Joseph—The Roentgen Diagnosis of Diseases of the Ileocecal Region of the Gastro-Intestinal Tract (Or.):
  Part I 188
  Part II 267

K

Kay, Willard E., and Fricke, John W.—Sobisminol: Its Oral Administration (Or.) 348
Kellogg, Frederick, and Cunha, Felix—Dermatomyositis (Or.) 337
Kinney, Lyell C.—X-ray Treatment of Carcinoma of the Breast (Or.) 333
Kruse, Fred H., and Herrmann, Walter W.—Hunner's Ulcer as an Unsuspected Cause of Gastro-Intestinal Symptoms (C. R.) 363
Kutzmann, Adolph A.—Enuresis (B. M.) 281

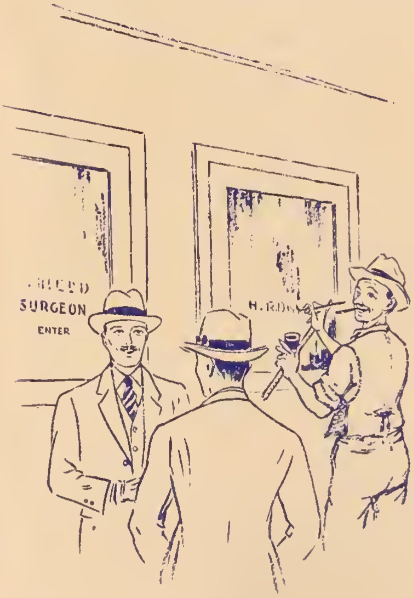
GEARY AND STOCKTON STREETS — AT UNION SQUARE



"Yes, I'm sprucing up for '39. Decided to start the New Year right by moving my offices into the very heart of the city."

The location is right—remarkably easy to get to.

The offices are right—they are adapted to the requirements of the medical profession. Both you and your patients will appreciate the light, airy, and comfortable rooms, either single or in suite.

Come in to see them, or call on

NOT ADVERTISED TO THE LAITY

The Morning Milk Company feels that all therapeutic claims should be disseminated exclusively through the medical profession. For this reason Special Morning Milk is not advertised to the laity. Furthermore, no formula instructions are distributed to the laity.

Special Morning Milk contains 500 units Vitamin D to the reconstituted quart (16 fluid oz. Special Morning Milk and 16 fluid oz. water). The Vitamin D added to Special Morning Milk is obtained from the natural source—cod liver oil. However, there is no cod liver oil taste in the milk.

BECAUSE THERE IS NO COD LIVER OIL TASTE IN SPECIAL MORNING MILK, THE ADMINISTRATION OF VITAMIN D IS GREATLY SIMPLIFIED.

Officers of the California Medical Association

General Officers

President—William W. Roblee, 202 Mission Inn Rotunda, Riverside.

President-Elect—Charles A. Dukes, 601 Wakefield Building, 426 Seventeenth Street, Oakland.

Speaker of House of Delegates—Lowell S. Goin, 414 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.

Vice-Speaker of House of Delegates—John H. Graves, 977 Valencia Street, San Francisco.

Chairman of Council—Karl L. Schaupp, 490 Post Street, San Francisco.

Vice-Chairman—Junius B. Harris, Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Chairman of Executive Committee—T. Henshaw Kelly, 830 Medico-Dental Building, 490 Post Street, San Francisco.

Chairman of the Committee on Public Relations—George G. Reinle, 532 Fifteenth Street, Oakland.

Past President—Howard Morrow, 384 Post Street, San Francisco.

Secretary-Treasurer—George H. Kress, 450 Sutter Street, Room 2004, San Francisco. Telephone DOuglas 0062.

Editor—George H. Kress, 450 Sutter Street, Room 2004, San Francisco.

General Counsel—Hartley F. Peart, Room 1800, 111 Sutter Street, San Francisco.

Associate General Counsel—Hubert T. Morrow, Van Nuys Building, 210 West Seventh Street, Los Angeles.

Councilors

(In addition to the elected district and at-large Councilors, the Council has as ex officio members, the general officers and the Chairman of the Committee on Public Relations. Chairman of Council, Karl L. Schaupp; Secretary, George H. Kress.)

District Councilors

First District—Imperial, Orange, Riverside, San Bernardino and San Diego Counties, Calvert L. Emmons (1941), 206 Emmons Building, Ontario.

Second District—Los Angeles County, Carl R. Howson (1939), 1114 Wilshire Medical Bldg., 1930 Wilshire Boulevard, Los Angeles.

Third District—Kern, San Luis Obispo, Santa Barbara and Ventura Counties, Louis A. Packard (1940), 563 Haberfelde Building, Bakersfield.

Fourth District—Calaveras, Fresno, Inyo, Kings, Madera, Mariposa, Merced, Mono, San Joaquin, Stanislaus, Tulare and Tuolumne Counties, Axcel E. Anderson (1941), Medical Group Building, 1759 Fulton Street, Fresno.

Fifth District—Monterey, San Benito, San Mateo, Santa Clara and Santa Cruz Counties, Alfred L. Phillips (1939), 84 Walnut Avenue, Santa Cruz.

Sixth District—San Francisco County, Karl L. Schaupp (1940), 530 Medico-Dental Building, 490 Post Street, San Francisco.

Seventh District—Alameda and Contra Costa Counties, Oliver D. Hamlin (1941), 389 Thirtieth Street, Oakland.

Eighth District—Alpine, Amador, Butte, Colusa, El Dorado, Glenn, Lassen, Modoc, Nevada, Placer, Plumas, Sacramento, Shasta, Sierra, Sutter, Tehama, Yolo, and Yuba Counties, Frederick N. Scatena (1939), Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Ninth District—Del Norte, Humboldt, Lake, Marin, Mendocino, Napa, Siskiyou, Solano, Sonoma and Trinity Counties, Henry S. Rogers (1940), Petaluma.

Councilors-at-Large

Harry H. Wilson (1941), 1919 Wilshire Boulevard, Los Angeles.

C. O. Tanner (1939), 3255 Fourth Street, San Diego.

William H. Kiger (1940), 911 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.

Philip K. Gilman (1941), 2000 Van Ness Avenue, San Francisco.

T. Henshaw Kelly (1939), 830 Medico-Dental Building, 490 Post Street, San Francisco.

Junius B. Harris (1940), Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Standing Committees

Executive Committee

The President, the President-elect, the Speaker of the House of Delegates, the Chairman of the Council, the Chairman of the Auditing Committee, the Chairman of the Committee on Public Relations, the Past President, the Secretary-Treasurer, and the Editor. (T. Henshaw Kelly, chairman; George H. Kress, secretary.)

Auditing Committee

O. D. Hamlin	Oakland	1939
T. Henshaw Kelly (Chairman)	San Francisco	1939
Philip K. Gilman	San Francisco	1939

Members of the Auditing Committee are appointed each year by the Chairman of the Council.

Committee on Associated Societies and Technical Groups

William H. Geistweit	San Diego	1939

President-elect ex officio

Committee on Scientific Work

F. M. Pottenger	Monrovia	1939
Lemuel P. Adams	Oakland	1940
J. Homer Woolsey	Woodland	1941

William H. Barrow, Secretary of Section on General Medicine, ex officio
Ray B. McCarty, Secretary of Section on General Surgery, ex officio
George H. Kress (Chairman), ex officio.

Committee on Public Relations

The Committee on Public Relations consists of the chairmen of the following standing committees and of certain general officers of the Association, all serving ex officio. The chairman of the committee is George G. Reinle, the secretary is George H. Kress. The director of the Department of Public Relations is George H. Kress. The chairman of the Committee on Public Relations is ex officio a member of the Council.

Fred B. Clarke	Chair., Com. on Health and Public Instruction
W. Earl Mitchell	Chair., Com. on Hospitals, Dispensaries, Clinics
Philip Stephens	Chair., Com. on Industrial Practice
George G. Reinle	Chair., Com. on Medical Defense
George D. Maner	Chair., Com. on Membership and Organization
John H. Graves	Chair., Com. on Medical Economics
Junius B. Harris	Chair., Com. on Public Policy and Legislation
Alson R. Kilgore	Chair., Cancer Commission
John C. Ruddock	Chair., Com. on Postgraduate Activities
William W. Roblee	President of California Medical Association
Charles A. Dukes	President-elect
George H. Kress	Secretary-Treasurer

Communications for the Public Relations Department should be addressed to the Director, George H. Kress, M. D., Room 2004, 450 Sutter Street, San Francisco.

Cancer Commission

Alson R. Kilgore (Chairman)	San Francisco	1939
Henry J. Ullmann	Santa Barbara	1939
Clarence G. Toland	Los Angeles	1939
Charles A. Dukes	Oakland	1940
Lyell C. Kinney (Vice-Chairman)	San Diego	1940
Otto H. Pflueger (Secretary)	San Francisco	1940
Orville Meland (Sec'y for Southern Section)	Los Angeles	1941
A. Herman Zeiler	Los Angeles	1941
Gertrude Moore	Oakland	1941

Communications for the Cancer Commission should be addressed to the Secretary, Otto H. Pflueger, M. D., Room 2004, 450 Sutter Street, San Francisco.

(Roster lists of officers of scientific section, component county societies, Woman's Auxiliary, A. M. A. delegates, special committees, etc., are continued on advertising pages 4 and 6.)

You Haven't Seen Us Here Before!

This is John Wyeth & Brother's first ad in your State Journal, and we're glad to be here to wish you a Happy and Prosperous New Year—Also to tell you about

SILVER PICRATE *Wyeth*

An effective *Council Accepted* Treatment for TRICHOMONAS VAGINALIS VAGINITIS

AN effective treatment by Dry Powder Insufflation to be supplemented by a home treatment (Suppositories) to provide continuous action between office visits. Two Insufflations, a week apart, with 12 suppositories satisfactorily clear up the large majority of cases.

SILVER PICRATE—a crystalline compound of silver in definite chemical combination with Picric Acid. Dosage Forms: Compound Silver Picrate Powder—Silver Picrate Vaginal Suppositories. *Send for literature today.*

JOHN WYETH & BROTHER, INC. • PHILADELPHIA, PA. • WALKERVILLE, ONTARIO • LONDON, ENGLAND

Trichinosis.—The preparation of a new and improved antigen for the diagnosis of trichinosis was recently described by Associate Zoölogist John Bozicevich of the National Institute of Health in the twelfth of a series of studies on this disease (*Public Health Reports,* December 2, 1938).

The new type of antigen may be used in connection with two previously devised diagnostic tests and evidence indicates that better results are obtained with the new antigen than with types of antigen employed previously. One method, similar in technique to Schick test for diphtheria, consists of injecting a small amount of trichina antigen into the skin, and later examining the site of injection to determine whether any reaction has taken place. The other method, the so-called precipitin test, is carried out in a test tube by overlaying a small amount of the patient's blood serum with an equal amount of various dilutions of the antigen. The study in question was undertaken with a view of improving the trichina antigen in order that more reliable results might be obtained in the diagnosis of the disease by these two methods.

Antigen prepared by this new method—involving isolation of trichina larvae, drying, and extraction with a neutral salt solution without the use of chemical preservatives or added extra salts—exhibits a marked specificity and excellent keeping qualities. Samples exposed to sunlight and room temperatures for periods as long as six months have shown no loss of potency when tested by the precipitin method. The material may also be put up in hermetically sealed vials and stored until needed.

Trichina antigen prepared in the new manner and used for precipitin and intradermal tests in an outbreak of trichinosis in Vermont, proved very effective for diagnosing cases of the disease. Forty-four hospitalized patients eventually reacted to both tests. However, two much reliance should not be placed on a single intradermal or precipitin test in diagnosing suspected cases of the disease. Since all persons suffering from trichinosis do not react in the same manner or at the same period of time following infection, evidence indicates that clinical symptoms, the differential blood picture, and other factors should be taken into consideration in establishing a diagnosis.

While a total of only 5,000 to 6,000 cases of trichinosis have been recorded in the United States since the disease was first recognized as a clinical entity, the results of more than 3,000 examinations conducted in the National Institute of Health indicate that approximately one of every six persons represented in the survey was infested with the trichina parasite. Heavy infestations, capable of producing clinical symptoms of trichinosis, were sufficiently numerous to warrant the belief that the disease occurs far more frequently than health reports indicate. Now that supplies of the improved antigen are available for use by physicians, it seems probable that more cases of trichinosis will be recognized.

Authorities point out that the geographic distribution of reported cases of trichinosis in the United States is correlated rather closely with the practice of feeding uncooked garbage to hogs. Hogs maintained on uncooked garbage have shown an incidence of trichinae of approximately 5 per cent and at the present time pork from such swine appears to be the chief source of trichinosis in man. The states of New York, California, Massachusetts, and Pennsylvania in the order named lead all others in the number of reported cases of the disease. In these states the feeding of uncooked garbage to swine is extensively carried on.

Evidence indicates also that many municipalities are contributing directly to the spread of trichinosis through sanction of the practice of feeding uncooked garbage to swine, maintained either on farms operated by the municipality or on farms operated by private contractors. Such hogs are usually slaughtered locally thus exposing inhabitants of the same city to the dangers of trichinosis.

Public health workers point out that it is a simple matter for the individual to guard against the contraction of the disease—the mere matter of cooking pork until it is thoroughly done is a sufficient measure of protection. The occurrence of the disease, therefore, is not a reason for restricting the consumption of pork but rather a reason for cooking pork well prior to its use.

ROSTER OF COUNTY MEDICAL SOCIETIES, CALIFORNIA MEDICAL ASSOCIATION

(County society secretaries are requested to promptly notify "California and Western Medicine" when changes are indicated in their roster information.)

Alameda County Medical Association

2404 Broadway, Oakland

President, Frank H. Bowles, 1624 Franklin Street, Oakland.

Secretary, Gertrude Moore, 2404 Broadway, Oakland.

Meeting, *Third Monday, 8:15 p. m., Hunter Hall, Oakland.*

Butte County Medical Society

President, E. L. Meyers, Fourth Street and Broadway, Chico.

Secretary, J. O. Chiapella, 131 Broadway, Chico.

Meeting, *Second Thursday.*

Contra Costa County Medical Society

President, Kaho Daily, 314 Tenth Street, Richmond.

Secretary, Clifford E. Dieterich, 1306 Pomona Avenue, Crockett.

Meeting, *Second Tuesday, 8 p. m.*

Fresno County Medical Society

President, Roland W. Dahlgren, 1006 Mattei Building, Fresno.

Secretary, Lester R. Nielson, 1006 Mattei Bldg., Fresno.

Meeting, *First Tuesday, University-Sequoia Club, Fresno.*

Humboldt County Medical Society

President, Samuel P. Burre, 507 F Street, Eureka.

Secretary, Joseph S. Woolford, 350 E Street, Eureka.

Meeting, *First Thursday.*

Imperial County Medical Society

President, Henry B. Graeser, 115 E. Fifth Street, Holtville.

Secretary, William A. Clarke, Holtville.

Meeting, *Third Tuesday, 7 p. m., Barbara Worth Hotel, El Centro.*

Kern County Medical Society

President, C. I. Mead, Haberfelde Building, Bakersfield.

Secretary, C. S. Compton, 428 C Street, Bakersfield.

Meeting, *Third Thursday, 8:00 p. m.*

Kings County Medical Society

President, P. K. Edmunds, Corcoran.

Secretary, William A. Johnstone, Hanford.

Meeting, *Second Monday, 8 p. m., Legion Hall, Hanford.*

Lassen-Plumas-Modoc County Medical Society

President, C. I. Burnett, Susanville.

Secretary, Fred J. Davis, Jr., Westwood.

Meeting, *On Call.*

Los Angeles County Medical Association

1925 Wilshire Boulevard, Los Angeles

President, William H. Daniel, 1930 Wilsbire Boulevard, Los Angeles.

Secretary, George D. Maner, 1925 Wilshire Boulevard, Los Angeles.

Meetings, *First and Third Thursdays, 1925 Wilshire Boulevard, Los Angeles.*

Marin County Medical Society

President, Harry N. Hensler, Home Market Building, San Anselmo.

Secretary, Carl W. Clark, 510 B Street, San Rafael.

Meeting, *Fourth Thursday, 7:00 p. m., Marin Golf and Country Club.*

Mendocino-Lake County Medical Society

President, Robert B. Smalley, Willits.

Secretary, Dallas Wagner, Fort Bragg.

Meeting, *On Call.*

Merced County Medical Society

President, E. M. Soderstrom, Merced.

Secretary, Fred O. Lien, Shaffer Building, Merced.

Meeting, *Third Thursday, Hotel Tioga, Merced.*

Monterey County Medical Society

President, Walter P. Farr, 308 Main Street, Salinas.

Secretary, Herbert Archibald, Salinas National Bank Building, Salinas.

Meeting, *First Thursday.*

Napa County Medical Society

President, Walter Rapaport, Imola.

Secretary, M. M. Booth, Bruck Building, St. Helena.

Meeting, *First Wednesday.*

Orange County Medical Society

President, G. Wendell Olson, 211 No. Pomona St., Fullerton.

Secretary, Glenn Curtis, 323 So. Pomona Street, Brea.

Meeting, *First Tuesday, 8 p. m., Chapel of the Orange County Hospital, Orange.*

Placer County Medical Society

President, William M. Miller, Auburn.

Secretary, Robert A. Peers, Colfax.

Meeting, *At Call of President.*

Riverside County Medical Society

President, N. K. Bear, 3655 Fourteenth Street, Riverside.

Secretary, Thomas A. Card, 3616 Main Street, Riverside.

Meeting, *Second Monday, 8 p. m., Library, Riverside Community Hospital.*

Sacramento Society for Medical Improvement

President, Dave Dozier, California State Life Building, Sacramento.

Secretary, Glenn E. Millar, 321 Physicians Building, Sacramento.

Meeting, *Third Tuesday, 8:30 p. m., Auditorium, Sacramento.*

San Benito County Medical Society

President, J. M. O'Donnell, Hollister.

Secretary, L. E. Smith, Hollister.

Meeting, *At Call of President.*

San Bernardino County Medical Society

President, Delbert B. Williams, 1151 D Street, San Bernardino.

Secretary, A. E. Varden, Medico-Dental Building, San Bernardino.

Meeting, *First Tuesday, 8 p. m., San Bernardino County Charity Hospital.*

San Diego County Medical Society

Fourteenth Floor, Medico-Dental Building, 233 A Street, San Diego

President, Bryant R. Simpson, 1205 Medico-Dental Building, San Diego.

Secretary, W. H. Newman, Medico-Dental Building, San Diego.

Meeting, *Second Tuesday, El Cortez Hotel.*

San Francisco County Medical Society

2180 Washington Street, San Francisco

President, Edwin L. Bruck, 384 Post Street, San Francisco.

Secretary, Stanley H. Mentzer, 2180 Washington Street, San Francisco.

Meetings, *Every Tuesday, 8:15 p. m., 2180 Washington Street, San Francisco.*

San Joaquin County Medical Society

President, N. P. Jobnson, Medico-Dental Building, Stockton.

Secretary, George H. Rohrbacher, Medico-Dental Building, Stockton.

Meeting, *First Thursday, 8:15 p. m., Medico-Dental Club Rooms, Stockton.*

San Luis Obispo County Medical Society

President, J. B. V. Butler, 722 Marsh Street, San Luis Obispo.

Secretary, E. M. Bingham, County Health Department, San Luis Obispo.

Meeting, *Third Saturday, 6:30 p. m., Gold Dragon Cafe, San Luis Obispo.*

San Mateo County Medical Society

President, N. D. Morrison, 205 Third Avenue, San Mateo.

Secretary, J. Garwood Bridgman, 205 Third Avenue, San Mateo.

Meeting, *Fourth Wednesday, Benjamin Franklin Hotel, San Mateo.*

Santa Barbara County Medical Society

President, W. H. Johnston, 1515 State Street, Santa Barbara.

Secretary, D. H. McNamara, 317 W. Pueblo Street, Santa Barbara.

Meeting, *Second Monday, Cottage Hospital.*

Santa Clara County Medical Society

President, Cletus S. Sullivan, Bank of America Building, San Jose.

Secretary, Leslie B. Magoon, 652 East Santa Clara Street, San Jose.

Meeting, *Third Wednesday, 8 p. m., Medico-Dental Building, San Jose.*

Santa Cruz County Medical Society

President, John T. Harrington, 10 Cooper Street, Santa Cruz.

Secretary, Samuel B. Randall, 84 Walnut Avenue, Santa Cruz.

Meeting, *First Monday, 7:30 p. m., Club Rio del Mar, Aptos.*

Shasta County Medical Society

President, B. F. Saylor, Redding.

Secretary, Morton J. Murphy, 1542 Market Street, Redding.

Meeting, *Second Monday.*

Siskiyou County Medical Society

President, J. B. McGuire, Mt. Sbasta.

Secretary, Victor W. Hart, 113 No. Oregon Street, Yreka.

Meeting, *Sunday on call.*

Solano County Medical Society

President, Ream S. Leachman, 727 Sonoma Street, Vallejo.

Secretary, Jobn W. Green, Box 539, Vallejo.

Meeting, *Second Tuesday, 8 p. m., Casa de Vallejo Hotel, Vallejo.*

Sonoma County Medical Society

President, D. C. Oakleaf, 301A West Street, Healdsburg.

Secretary, T. E. Albers, 600 B Street, Santa Rosa.

Meeting, *Second Thursday.*

Stanislaus County Medical Society

President, John A. Cooper, 1024 J Street, Modesto.

Secretary, Hoyt R. Gant, 403 Beaty Building, Modesto.

Meeting, *Second Tuesday.*

Tehama County Medical Society

President, Donald E. Thompson, Red Bluff.

Secretary, F. J. Bailey, Red Bluff.

Meeting, *At Call of President.*

Tulare County Medical Society

President, E. R. Zumwalt, Tulare.

Secretary, Karl F. Weiss, Security First National Bank Building, Visalia.

Meeting, *Sunday Evening once a month.*

Ventura County Medical Society

President, Grundy C. Coffey, Bank of America Building, Ventura.

Secretary, A. A. Morrison, 625 Main Street, Santa Paula.

Meeting, *Second Tuesday, Ventura County Country Club.*

Yolo-Colusa-Glenn County Medical Society

President, H. G. Potter, Winters.

Secretary, W. J. Blevins, Jr., Woodland.

Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society

President, P. E. Thunen, I. O. O. F. Building, Marysville.

Secretary, Leon M. Swift, I. O. O. F. Building, Marysville.

Meeting, *First Tuesday.*

ACCEPTED AMERICAN MEDICAL ASSN. Council on Pharmacy and Chemistry

One-eyed Drivers.—One to two per cent of drivers are completely blind in one eye, but a more serious problem is presented by the fact that between 20 and 40 per cent of all motorists have a deficient eye which handicaps them. No state prohibits either group from driving. This is brought out in a report on "One-eyed Drivers" in the current issue of *The Sight-Saving Review*, quarterly journal of the National Society for the Prevention of Blindness. The authors of the report—H. R. DeSilva, W. H. Frisbee, Jr., and P. Robinson—are research associates in the Institute of Human Relations at Yale University.

"Only about twenty states make any check on vision for the driver's license," the report says. "There is, however, no agreement regarding visual standards. A reason for the absence of uniformity lies in the lack of attested facts on the part played by vision in driving. The standards suggested by different individuals or agencies do not conform with one another. The fact that they vary among themselves and are based upon insufficient research shows the need for further investigation."

The authors reached the conclusion that "most one-eyed and deficient-eyed drivers are oblivious to the defects which predispose them to accidents. The greatest human hazard arises not from the defects but from ignorance of the dangers from such defects. For most of these drivers the solution lies in personal reëducation adapted to their individual needs. For others, and especially those who have shown themselves incapable of profiting from reëducation, the solution lies in revocation of their licenses."

The one-eyed person is particularly handicapped in night driving, the report points out, adding: "Not only is a one-eyed person more sensitive to glaring lights, but it takes him much longer to recover from the glare and to see the road clearly again. The one-eyed motorist should drive as little as possible at night.

"The field of vision for a one-eyed individual depends partly upon the protrusion of his good eye and the bridge of his nose. The person with pop-eyes and a small nose will naturally see farther around his nose than a person with deep-set eyes.

"The most obvious compensation for the handicap of having one eye is for the driver to keep his head turned at an angle so as to spread his visual field evenly on both sides. Many one-eyed persons do not compensate nearly enough, since turning the head attracts attention and they are anxious to conceal their defect.

"Another form of correction possible is to keep the head and the eyes roving continually from right to left while driving in order to bring possible dangers from the side into the field of clear vision of the good eye. This habit is unfortunately not common enough among one-eyed persons.

"The hazards of driving are not the same for the right-eyed and the left-eyed driver, since we steer our cars from the left-hand side and drive on the right side of the road.

"Left-eyed persons with deficient or blind right eye have difficulty: (1) In perceiving pedestrians stepping off sidewalk, or walking along the roadway either by day or night; (2) in viewing road when making a right turn; (3) in perceiving cars approaching from the right of intersections; (4) in passing other cars (apt to cut in too soon or clip rear bumper in cutting out); (5) in perceiving road signs and traffic lights; (6) in backing out from angle parking; (7) in perceiving cars parked at an angle backing out; and (8) in keeping on right side of road (on account of inability to see edge of road easily).

"Right-eyed persons with deficient or blind left eye have difficulty: (1) In perceiving pedestrians on account of losing them in blind spot; (2) in viewing road when making a left turn; (3) in perceiving cars approaching from the left at intersections; (4) in avoiding oncoming cars (since they guide by right edge of road); (5) in perceiving road signs, on account of losing them in blind spot; (6) in backing out from parallel parking; (7) in perceiving jay walkers in middle of road; and (8) in watching traffic in rear mirror when located on side, as in a truck."

In 1937, 1,803 suicides were registered in California as compared with 1,602 suicides recorded in 1936. During recent years, presumably because of the economic depression, the suicide rates have been unusually high.

OFFICERS OF SCIENTIFIC SECTIONS, CALIFORNIA MEDICAL ASSOCIATION

Anesthesiology

Chairman, John G. Dunlop, 168 So. Kingsley Drive, Los Angeles.
Secretary, Adena C. Dutton, 1955 Broadway, San Francisco.

Dermatology and Syphilology

Chairman, Norman N. Epstein, 450 Sutter Street, San Francisco.
Vice-Chairman, Franklin I. Ball, 6253 Hollywood Boulevard, Hollywood.
Secretary, Arne E. Ingels, 490 Post Street, San Francisco.

Eye, Ear, Nose and Throat

Chairman, Clifford B. Walker, 427 West Fifth Street, Los Angeles.
Vice-Chairman, Harry J. Wiley, 2701 Florence Street, Huntington Park.
Secretary, Dewey R. Powell, 242 No. Sutter Street, Stockton.

General Medicine

Chairman, Howard F. West, 602 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.
Secretary, William H. Barrow, 1400 Medico-Dental Building, San Diego.

General Surgery

Chairman, Loren R. Chandler, Stanford University Medical School, San Francisco.
Secretary, Ray B. McCarty, 3616 Main Street, Riverside.
Assistant Secretary, Frederick S. Foote, 490 Post Street, San Francisco.

Industrial Medicine and Surgery

Chairman, Harvey G. McNeil, 523 West Sixth Street, Los Angeles.
Vice-Chairman, George H. Sanderson, 242 North Sutter Street, Stockton.
Secretary, John S. Stephens, 1136 W. Sixth Street, Los Angeles.

Neuropsychiatry

Chairman, John B. Doyle, 1930 Wilshire Boulevard, Los Angeles.
Secretary, George S. Johnson, Stanford University Hospital, San Francisco.

Obstetrics and Gynecology

Chairman, George W. Coon, 3770 Twelfth Street, Riverside.
Vice-Chairman, John N. Ewer, 411 Thirtieth Street, Oakland.
Secretary, William Benbow Thompson, 1930 Wilshire Boulevard. Los Angeles.

Pathology and Bacteriology

Chairman, Alvin G. Foord. Huntington Memorial Hospital, Pasadena.
Secretary, Roy W. Hammack, 657 South Westlake Boulevard, Los Angeles.
Assistant Secretary, Paul H. Guttman, 1127 Eleventh Street, Sacramento.

Pediatrics

Chairman, Harold K. Faber, Stanford Hospital, San Francisco.
Secretary, Hartzell H. Ray, 23 Second Avenue, San Mateo.
Assistant Secretary, W. W. Belford, 601 Medico-Dental Building, San Diego.

Radiology

Chairman, Karl M. Bonoff, 1930 Wilshire Boulevard, Los Angeles.
Secretary, Carl D. Benninghoven, Mills Memorial Hospital, San Mateo.

Urology

Chairman, Carl F. Rusche, 905 Taft Building, 1680 North Vine Street, Hollywood.
Secretary, John A. Dougherty, 3115 Webster Street, Oakland.

Delegates and Alternates to the American Medical Association

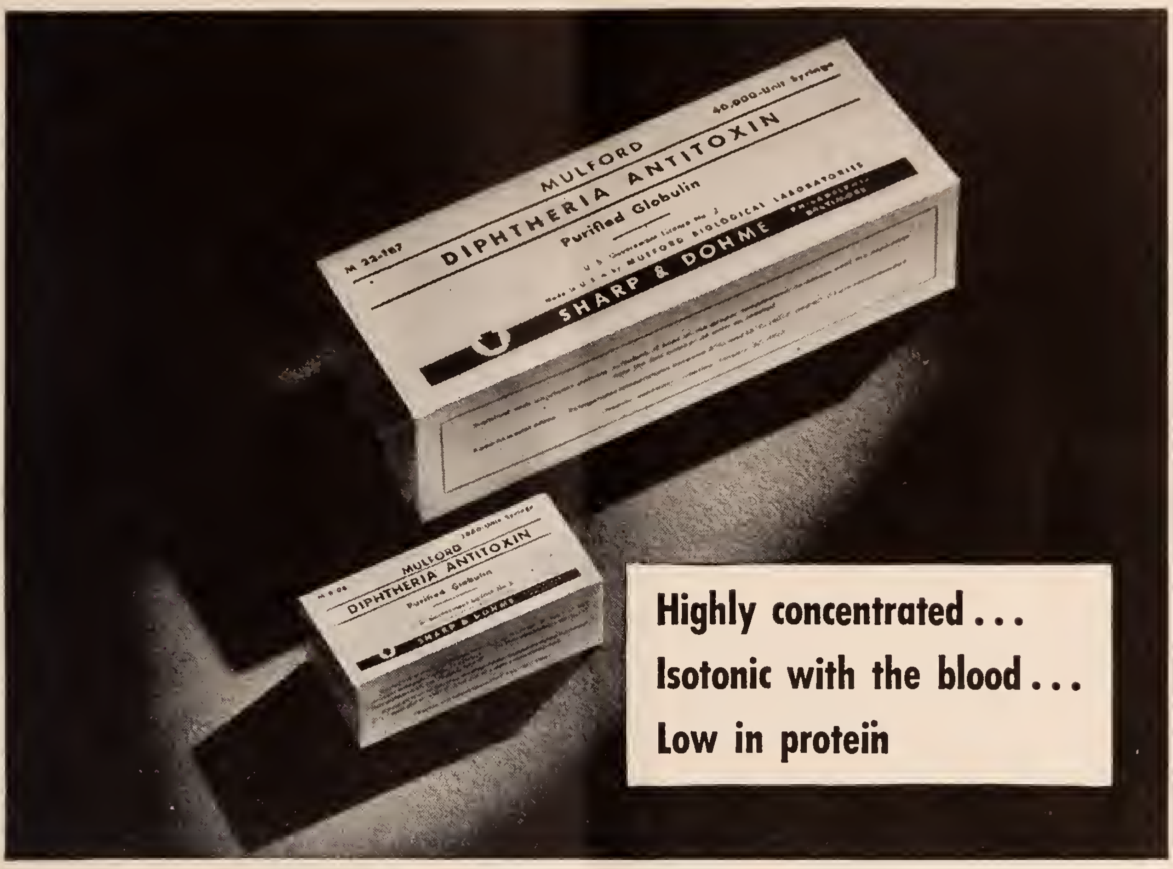
* Deceased.



Diphtheria Antitoxin, Mulford

The Mulford Biological Laboratories of Sharp & Dohme produced the first commercial diphtheria antitoxin in the United States in 1894. Patient and painstaking research has since evolved constant refinements in product and package. The culmination of this progressive development is Mulford Diphtheria Antitoxin, Purified Globulin—a superior product of high unit value and concentration.

The desirability and advantages of high unit value in small volume have been constantly stressed by medical authorities who urge the use of such an antitoxin earlier in the disease and in larger unit dosage.

Mulford Diphtheria Antitoxin, Purified Globulin, is well adapted for the administration of large unit dosage. Because of the reduction in bulk, it is easy to administer and causes less pain to the patient. It is rapidly absorbed and develops quicker patient response due to more rapid neutralization of the toxin. Although highly concentrated, it is isotonic with the blood. It is low in protein.

• • •

Mulford Diphtheria Antitoxin, Purified Globulin, is supplied in syringes of 1,000 units; 5,000 units; 10,000 units; 20,000 units and 40,000 units. Our complete line of diphtheria biologicals also includes Mulford Diphtheria Toxoid, Alum Precipitated, Refined in ½-cc. and 1-cc. doses; Mulford Diphtheria Toxoid (Anatoxine Ramon); Mulford Diphtheria Toxin for the Schick Test; and Mulford Diphtheria Toxin for Schick Test Control.

COÖPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY — FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

New York Polyclinic Medical School and Hospital.—"The Clinical Society of the New York Polyclinic Medical School and Hospital held its monthly meeting on Monday evening, January 8, 1939, at which time the following program was presented:

1. "The Prostate and the Practitioner" by Joseph F. McCarthy, M.D., Professor of Urology, New York Polyclinic Hospital. Discussion to be opened by J. Sydney Ritter, M.D., and Samuel E. Kramer, M.D.

2. "Recent Advances in the Treatment of Internal Diseases" by Llewellys F. Barker, M.D., Baltimore, Maryland. Discussion to be opened by Orrin S. Wightman, M.D., Bernard Sachs, M.D. and James P. Croce, M.D.

3. "Clinical Diagnosis of Peripheral Vascular Diseases—Motion Pictures" by Benjamin Jablons, M.D., New York Polyclinic Hospital.

Dr. H. M. Eberhard, Professor of Gastro-enterology at Hahnemann Medical School, Philadelphia, Pennsylvania, read a paper on "The Effect of Hot and Cold on the Gastro-Inestinal Tract" on Thursday, December 15 at 3:30 p. m.

Dr. Rudolf Schindler, Chicago, Illinois, read a paper on "The Clinical Value of Gastroscopy" on Wednesday, November 30, at 2:30 p. m.

Death from Natural Causes Is Rare.—Death from natural causes is one of the rarest occurrences among the human race, says William R. P. Emerson, M.D., in an article "Extending Our Years," in the December issue of *Hygeia.* The death rate from heart disease, cancer, apoplexy, pneumonia, accidents, nephritis (kidney trouble), tuberculosis, diabetes and appendicitis is completely out of proportion to the low mortality rate possible if the available knowledge of preventive medicine were applied to the fullest extent.

The first positive step in circumventing death is a thorough physical examination. Many ailments—diabetes and kidney trouble, for instance—can exist for years without obvious symptoms.

Even valvular heart trouble can be present throughout life without a patient being conscious of it until the fatal attack occurs. By detecting the first signs of deterioration in our organs these periodic examinations can forestall death.

The fact that human life, on the average, has been prolonged twenty years during the past century is due almost entirely to the reduction of infant and child mortality. After thirty-five, life has not been extended a single year in the last two generations. Between fifty and seventy, life expectancy is not so great as it was a century ago, despite the brilliant achievements of medicine and surgery.

To compensate for this, then, the periodic health examination is necessary. If one is overweight, he should let the doctor prescribe a reducing diet that will take off not more than one pound a week. Sensible reducing is the best possible life assurance, for after thirty-five, mortality increases 1 per cent for every pound of overweight.

Noisy work performed in a confined space is more harmful to the ears than if done in the open air.

Cook County
Graduate School of Medicine
(IN AFFILIATION WITH COOK COUNTY HOSPITAL)

The American Social Hygiene Association.—A $15,000 gift to the National Anti-Syphilis Committee of the American Social Hygiene Association raises the total in its $500,000 appeal to $187,065 and will aid in promoting National Social Hygiene Day, February 1.

This was anounced by Dr. Ray Lyman Wilbur, president, following action of the Administrative Committee in naming the date for the annual nation-wide observance. The donor requested that the gift be anonymous.

Third Social Hygiene Day is expected to exceed in scope and effectiveness the observance of the last two years, according to Dr. Walter Clarke, executive director. He stated that evidences in the association's New York and San Francisco offices indicate that larger numbers of voluntary health and welfare agencies, civic groups, service clubs, women's organizations, churches, schools and other youth bodies were preparing for meetings and community-wide campaigns against syphilis on and near this date.

National slogan for the day, which will be marked by an estimated 5,000 town and city social hygiene programs, is "guard against syphilis." Objectives of the 1939 offensive against syphilis, toward attainment of which Social Hygiene Day was said to provide an avenue of approach, were stated in terms of the association's new "eight-point program on forty-eight state fronts."

These include plans to:

Organize more local and state committees to fight syphilis and gonorrhea.

Encourage passage of laws for prevention of syphilis in marriage and childhood.

Fight prostitution and medical quackery.

Aid employers and employees against the economic losses caused by these diseases.

Extend information on social hygiene to the youth of America.

Expand the personal advisory and consultation service.

Guide parents, teachers and pastors in sound principles of sex education of youth.

Continue observations and reports to citizens regarding official programs.

Marihuana. — Marihuana, as produced in the United States, presents a problem to chemists, agronomists and pharmacologists, as well as sociologists, it was reported today by United States Commissioner of Narcotics Harry J. Anslinger, following the first general conference on the problem, held in the Bureau of Internal Revenue Building.

While Federal and State agencies have discussed the marihuana problem, this was the first occasion on which chemists and educators met with Federal representatives.

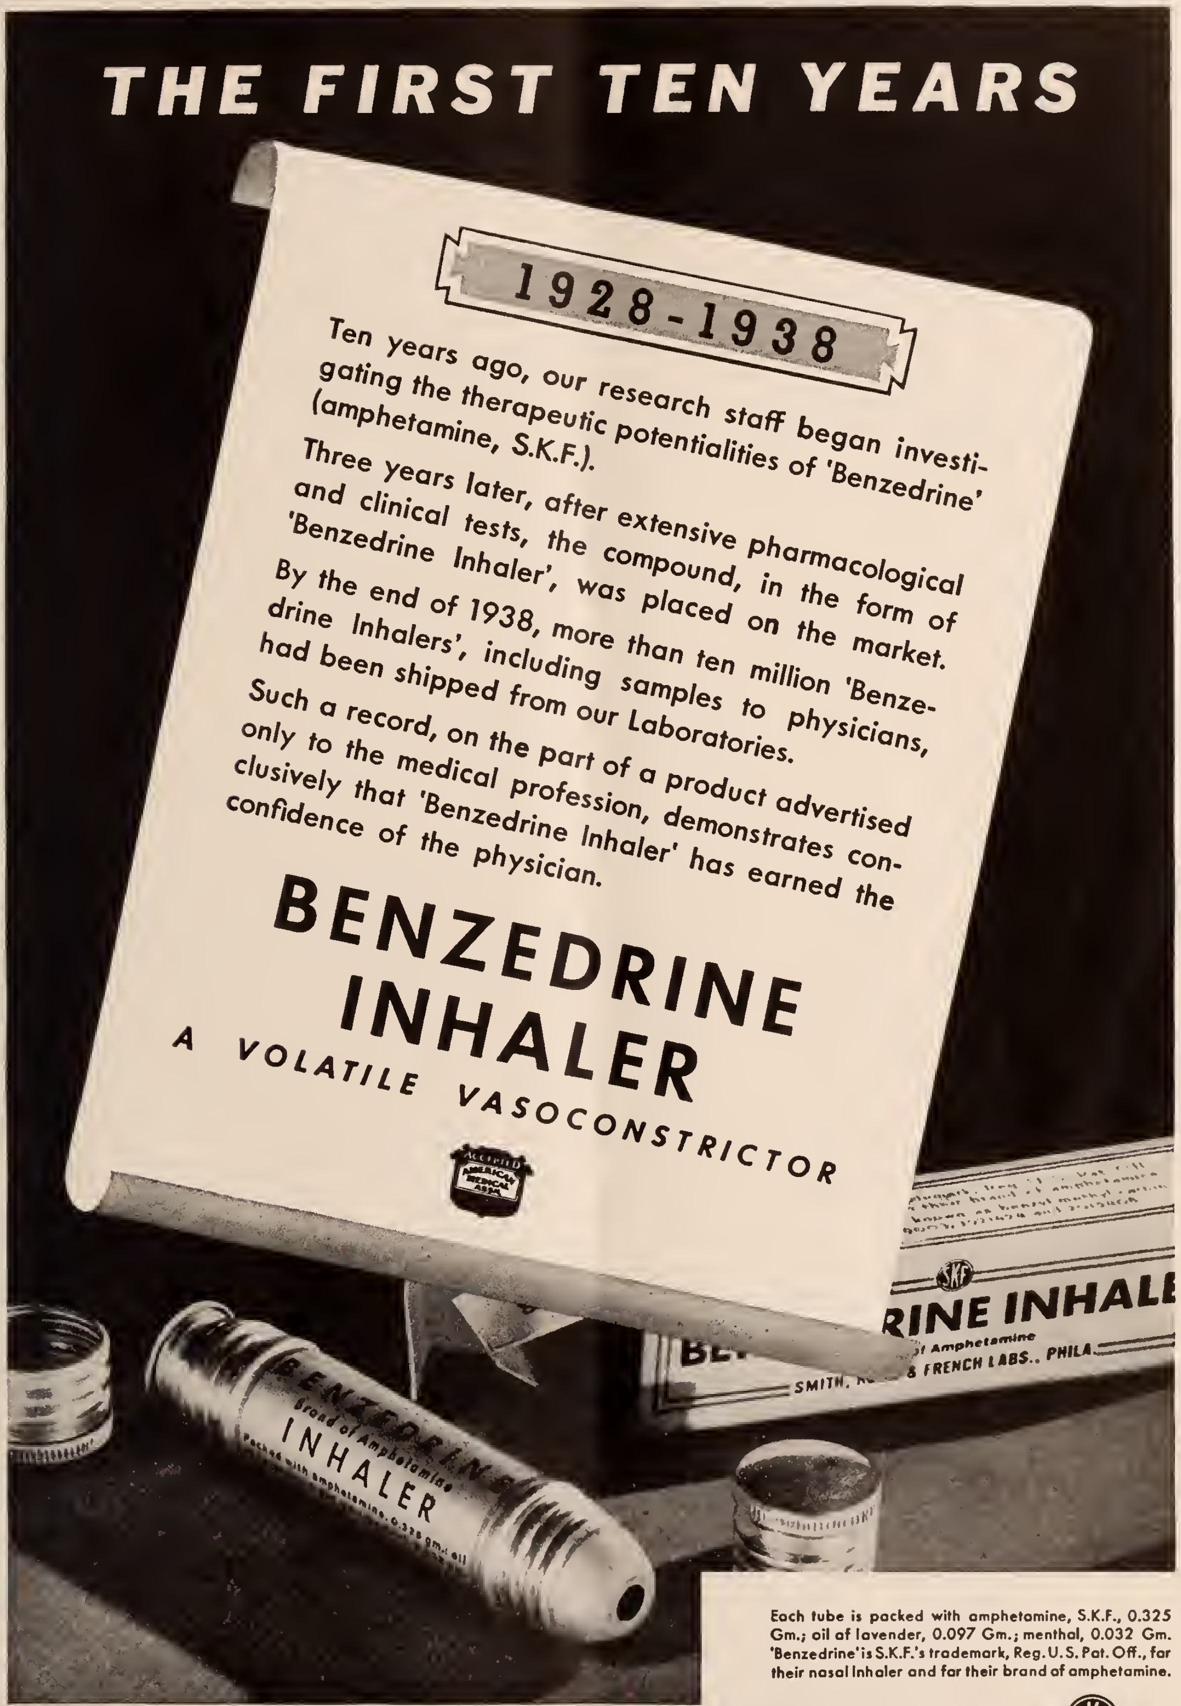
Two immediate problems in the study of the drug obtained from Indian hemp, Mr. Anslinger declared following the conference, are the necessity of determining the active constituents of the narcotic obtained from the hemp plant, and to perfect a hemp variety that will fill industrial requirements while producing a negative quantity of marihuana.

Chemists generally are agreed that cannabinol, the oily narcotic resin derived from hemp, contains more than one drug, although experiments so far have failed to isolate or identify them.

To facilitate this study, Herbert J. Wollner, consulting chemist of the Treasury Department, has perfected plans with other Federal educational and private research agencies.

Sandoz Chemical Works, Inc., West Coast Branch, Pharmaceutical Dept. — The Sandoz Chemical Works, Inc., has opened a West Coast branch, located at Room 312, 450 Sutter Street, San Francisco. This office is managed by Harry Althouse, and is staffed adequately to handle all inquiries pertaining to Sandoz products. Catalogs will be sent on request. Telephone YUkon 2454.

Regimen is better than physic. Every one should be his own physician. We ought to assist and not to force nature. Eat with moderation what agrees with your constitution. Nothing is good for the body but what we can digest. What medicine can procure digestion? Exercise. What will recruit strength? Sleep. What will alleviate incurable evils? Patience.—Voltaire.



THE FIRST TEN YEARS

1928-1938

Ten years ago, our research staff began investigating the therapeutic potentialities of 'Benzedrine' (amphetamine, S.K.F.).

Three years later, after extensive pharmacological and clinical tests, the compound, in the form of 'Benzedrine Inhaler', was placed on the market.

By the end of 1938, more than ten million 'Benzedrine Inhalers', including samples to physicians, had been shipped from our Laboratories.

Such a record, on the part of a product advertised only to the medical profession, demonstrates conclusively that 'Benzedrine Inhaler' has earned the confidence of the physician.

BENZEDRINE INHALER

A VOLATILE VASOCONSTRICTOR

Each tube is packed with amphetamine, S.K.F., 0.325 Gm.; oil of lavender, 0.097 Gm.; menthol, 0.032 Gm. 'Benzedrine' is S.K.F.'s trademark, Reg. U.S. Pat. Off., for their nasal Inhaler and for their brand of amphetamine.

COACHING FOR STATE MEDICAL BOARD—CHARLES L. Rubenstein, M. D., 450 Sutter Street, Suite 1612. Telephone SUtter 4576.

FOR SALE OR RENT—FIRE PROOF BUILDING, LOcated close to down-town San Francisco medical center, suitable for rest or nursing home, formerly equipped for ten-bed hospital. For information, write Box 1200, California and Western Medicine, 450 Sutter St., San Francisco, California.

EYE, EAR, NOSE AND THROAT MAN, EXCELLENT education and preparation here and abroad, desires association with individual or group. Have license. Experienced and capable of major surgery in specialty, including bronchoscopy. At present in practice in large midwestern city. Gentile, Protestant; able to make moderate investment. Address Box 100, care of California and Western Medicine, 450 Sutter Street, San Francisco, California.

FOR SALE—UNOPPOSED COUNTRY PRACTICE, 125 miles north of San Francisco. Farming and resort section. Collections in 1938, $4,800. Price $1,000; equipment optional. Young married man will do best. Respond at once; no triflers. Address Box No. 120, care of California and Western Medicine, 450 Sutter Street, San Francisco, California.

MEDICAL PLACEMENTS—WE COVER THE WESTERN states for medical placement. Practices for sale; locations wanted; positions as assistants, locum tenens, laboratory and x-ray technicians, etc. Write us about your wants and we shall be glad to be helpful. Pacific Coast Medical Bureau, P. O. Box 492, Chehalis, Washington.

Aluminum Cooking Utensils Harmless.—At regular intervals, health departments are besieged with inquiries relative to the assumed hazards to health that may lie in the use of aluminum cooking utensils.

Over a long period of years, scientific investigations into the matter have been carried on. From most reliable sources and without bias, it may be stated definitely that the use of aluminum cooking utensils is not a causative factor in any known disease. Misleading information causes many people to believe that the use of such utensils produces digestive disturbances and chronic illnesses. The most reliable scientific authorities in the United States and in Europe have issued reports that are at complete variance with this supposition.

Aluminum salts are found in most of the vegetables, the underground roots of which are used for human consumption. There is a possibility that such salts constitute an essential ingredient in the diet of mankind. Even though aluminum salts from cooking utensils might be absorbed into food products, there is no possibility that they might be injurious to the health of any human being.

Golden Gate International Exposition: Tuberculosis Exhibit.—Tuberculosis not only can be prevented, it can be cured!

This outstanding medical achievement will be demonstrated to millions of California World's Fair goers during 1939 by the California Tuberculosis Association.

The exhibit will show the strides of science, stress the need of public education and coöperation. Microbes which cause the disease will be exposed and the simple, quick and accurate methods of diagnosis will be shown. The x-ray, the skin and sputum tests will be demonstrated.

Part of the display will be devoted to exhibits on tuberculosis treatment by rest, sunshine and surgery. Complete rest, long known as one of the best methods of treatment, still ranks high, and surgery, only newly developed, will be shown as an additional method of affecting a complete cure. The exhibitors will show how a lung may be collapsed, bringing about complete rest to the infected section.

The chemistry of the microbes will be revealed in one part of the display. Pasteurization of milk as a health factor will be demonstrated and other methods of prevention will be shown. Ford Higby, Executive Secretary of the Association, said other exhibits will indicate the work of his society in eradicating bovine tuberculosis from California dairies.

Uses to which the Christmas Seal money has been applied will be shown, and the vast clinical program carried on in California will be recounted. More than 70,000 school children went through clinics last year, that less than 300 were shown to have the adult type tuberculosis and only 30 per cent of the children had been exposed. All positive reactors were x-rayed.

The educational and rehabilitation phases of the association program will be presented also.

Lippincott Company, 1938.

Clinical Laboratory Methods and Diagnosis. A Textbook on Laboratory Procedures With Their Interpretation. By R. B. H. Gradwohl, M. D., Director of the Gradwohl Laboratories, and Gradwohl School of Laboratory Technique; Formerly Director of Laboratories, St. Louis County Hospital; Pathologist to Christian Hospital; Director, Research Laboratory, St. Louis Metropolitan Police Department, St. Louis, Mo.; Commander, Medical Corps, Fleet, United States Naval Reserve. Second edition. Cloth. Pp. 1,607, with 492 illustrations in the text and forty-four color plates. Price, $12.50. St. Louis: The C. V. Mosby Company, 1938.

Medicine in Modern Society. By David Riesman, M. D., Professor of the History of Medicine and Professor Emeritus of Clinical Medicine, University of Pennsylvania. Cloth. Pp. 226. Price, $2.50. Princeton: Princeton University Press, 1938.

You and Heredity. By Amram Scheinfeld, assisted in the genetic sections by Dr. Morton D. Schweitzer, Research Geneticist, Cornell University Medical College. Cloth. Pp. 434, with four color plates, seventy-one line illustrations, maps and diagrams by the author, and six halftone reproductions from photographs. Price, $3.75. New York: Frederick A. Stokes Company, 1939.

BOOK REVIEWS

Bibliography of Rural Medicine. By David Kydd, M. D., The Mary Imogene Bassett Hospital, Cooperstown, New York. Cloth. Pp. 38.

In this pamphlet, Doctor Kydd has compiled some three hundred seventy-five references to literature dealing with rural medicine. The bibliography is fairly comprehensive, including current periodicals, official publications and several books which have established themselves as authoritative source material. References to rural medicine and public health in foreign countries are also listed, including those of the smaller countries of central Europe, as well as China and India in the Orient. Those references with foreign titles are, for the most part, given in brief line in English to indicate their contents.

The bibliography deals with nearly every phase of rural medicine, including economics, costs of medical care, population studies, medical practice, etc. One-third of the material, however, is concerned with service, conditions, organization and administration of public health in rural areas. Attention has largely been given to the literature of the last eight or ten years, and represents the experience and trends of recent years. The contents have been classified by authors, and to quote Doctor Kydd, "Rather than to strive for completeness, an attempt has been made in this bibliography of rural medicine to gather together a few of the articles that characterize the thought that has been given to the subject." On the whole, the author has succeeded in his endeavor "to provide certain initial foci or points of departure for a comprehensive investigation of the subject of rural medicine."

K. F. Meyer, M. D.

There were but three deaths from smallpox registered in California last year, and none in 1936. This would indicate that the disease, through vaccination, is kept in check.

THE WORLD'S LARGEST MAKERS OF PHARMACEUTICAL AND BIOLOGICAL PRODUCTS

AN INTENSIVE TEN DAYS COURSE IN

ABDOMINAL SURGERY

February 7th to 17th, 1939 » Fee, $125

SCOPE: The work will be limited to the abdomen and include the following organs:

STOMACH AND DUODENUM
GALL-BLADDER AND BILE DUCTS
SMALL INTESTINE
COLON
RECTUM

KIDNEY AND URETER
BLADDER AND PROSTATE
MALE GENITAL ORGANS
FEMALE GENITAL ORGANS
HERNIAS

ANATOMY—A brief, systematic review will be given of the descriptive and surgical anatomy of the abdomen. This will include demonstrations on carefully dissected cadavers, and dissections by the students.

LABORATORY—This work will be done mostly on fresh human material. Special attention will be given to the latest methods of intestinal anastomoses, operations on the gall-bladder and bile ducts, three-row stomach technic, aseptic colon surgery, ribbon-gut operations on the kidneys, etc. Mimeographed copies of all directions and lectures on anatomy and technic will be furnished to the students without extra cost.

WORK ON THE LIVING—Demonstrations of operations on the living will be given by some of the leading surgeons of San Francisco in the various hospitals. Opportunities will be given to assist in operations and to do a certain amount of operating on living subjects.

TEN MONTHS COURSE AT HOME—The work will be divided into ten distinct parts, one for every day. At the completion of the course proper directions will be given so that the graduates can devote one month to each of these parts, thus converting the intensive course into one of ten months.

Applicants must be graduates of schools approved by the State Board of Medical Examiners

For descriptive circular and further information inquire of

fully and well; we certainly are sorry to see him obliged, by such petty and mutton-headed interference, to sever his connection with the health work of the state.

* * *

School of Hygiene and Sanitation.—There exists at present no school of hygiene and sanitation on the Pacific Coast, a lack which we have every reason to believe will soon be supplied by the establishment of such a school in the University of California. The tardiness of the West in recognizing so important a field relating to the health of the public and in organizing an institution for the training of specialists in these lines, is more apparent than real, for the courses in public health given at the University are remarkably comprehensive. Indeed, these courses, which are described in a circular accessible to all who are interested, are so numerous and varied that the subjects making up a curriculum in public health are already quite completely covered. . . .

* * *

Very Important to You!—Two very important and far reaching economic conditions have their beginning this year of 1914. One is the new income tax law and the other is the state "Workmen's Compensation, Insurance and Safety Act," which goes into effect January 1. In regard to the income tax, every physician should carefully study his own income and more particularly his own expenses. Under the law, expenses necessary for the conduct of one's occupation may be deducted from the gross income; no small part of a physician's expenses are those required by the nature of his occupation and as such are not to be included in his taxable income. The *Journal of the American Medical Association,* in a recent issue, had an excellent editorial on this subject and particularly emphasized the fact that the law will have one good effect upon physicians, at least, for it will force them to be more accurate in the matter of their accounts. . . .

"Squeeze the Doctor" Again! . . . When commercialism comes into contact with professionalism, it almost invariably wins out. Heretofore we have had to fight commercialism in the shape of contract practice as organized by private enterprise and conducted more or less on the retail plan. With the coming of the "Workmen's Compensation, Insurance and Safety Act," however, we are confronted by commercialism on a wholesale scale and contract practice extended to the limit. The law is very complex and far reaching and it will take some time to find out exactly what it really means in many ways and just how it is going to work out. Some few essential points are pretty clear, however. All employees, except a few classes, must be cared for by the employer in the event of injury by accident and the salary must be paid during forced absence from work. . . .

Are we going to calmly accept what some one else is willing to offer or are we going to have a voice in fixing the amount of the fees that shall be paid to us for our services? That is the question, and the sooner we begin to discuss it seriously the better off we shall be in the long run. The actual fee schedule has not been finally determined by the insurance companies and it cannot be fixed for some few months, for it is not known how the act will work out nor how little physicians can be paid; but rest assured of one thing—the physician will be paid the smallest fee that the insurance companies can get him to accept! If all the members of the various county units will stand together in this matter, it is certain that satisfactory fees will be paid and that the financial burden will be placed where it belongs—on the business man employer, and not where the attempt will certainly be made wrongfully to place it—on the physician.

be omitted and attention directed to a consideration of the subject as indicated by title.

It is now about four years since the beginning of the present epizoötic of rabies in California began in Los Angeles. Previous to that time a small outbreak occurred in Los Angeles in 1898, which was suppressed by a muzzling ordinance. A few cases also occurred in 1906 among the animals of the Soldiers' Home near Los Angeles.

Rabies first appeared in San Francisco in October, 1911, when one case was reported by a veterinary surgeon. No other cases were reported until February, 1912, since which time there has not been a month, hardly a week, in which one or more cases were not reported. From the middle of February, 1912, to August 31, 1913, the laboratory of the San Francisco Board of Health has made 546 examinations for rabies, of which 355 were positive. The number and kind of animals were as follows:

Human	8	Cows	1
Dogs	328	Horses	2
Cats	11	Calves	1
Goats	4		

From an Original Article on "Points Regarding Tuberculosis of Interest to Health Officers" by Robert A. Peers, M.D., Colfax.—When asked to present a paper before your body it seemed to me that it might be of some value to you if I should speak upon the subject as shown on the programs, namely: Points Regarding Tuberculosis of Interest to Health Officers. Theoretically, that presented a subject very appropriate for the occasion. Practically, when I came to prepare my paper I asked myself, "What is there about tuberculosis of interest to the health officer that is not of interest to the public individually and collectively?" And indeed, anything intimately concerned with the control of the morbidity and mortality of the people, in order that we may attain the highest efficiency and achieve the most far-reaching results in matters pertaining to public health, must be made subject to very careful study by the layman as well as by the officially designated health officer. When that millennium arrives we may hope to conquer and wipe out all infectious diseases. In practice, however, the health officer, as the representative of the people, the one upon whose individual shoulders is thrust the collective burden of the community, is the one who does the work. . . .

From an Original Article on "The Relation of the Sanitarium to Vocational Guidance" by William Simpson, M.D., San Jose.—Every sanitarian, and particularly every health officer, must be an instructor and, as such, interested either for or against every educational movement. He must be for such movements as favor the physical development of the race which is the health officials' especial care. He must be against those which take from the boy or girl the full measure of growth to which each is entitled.

Thus far the boy has never been sized up by anybody but himself. No university graduates the girl in the knowledge of the duties and pleasures of motherhood, the one employment man can never take from her, and which she is taught to fear rather than welcome. Can we help these boys and girls to know their abilities and opportunities, or must they still blunder along and take their chances? Vocational guidance attempts to show the boy and girl how to grasp the opportunity and how to escape the blunders. . . .

From an Original Article on "Modifications in Administrative Measures Necessitated by the Carrier Problem" by F. W. Browning, M.D., Hayward.—The "carrier" problem confronts us very seriously in California for the reason that as yet the State Board of Health has not promulgated any regulations for the guidance of the health officer. Criticism, however, is not called for because no practical solution of the problem has been found. It is brought before this body of health officers at this time in the hope that practical

"By examining you periodically in health, your doctor can help you prevent needless disease. By your intelligent cooperation when ill, he can apply to your healing the knowledge and skill of modern scientific medicine. But in his practice the physician must consider factors which no exhibit can reveal.

It is the hope of the sponsors of the Camp Transparent Woman that those who studied this exhibit may become more intelligent and cooperative patients in illness, and reasonably careful and considerate of their bodies in health."

* *Excerpt from the lecture delivered during demonstrations of the Camp Transparent Woman exhibit to the laity.*

Report on the 2-Year Tour of THE CAMP TRANSPARENT WOMAN

IN DECEMBER, 1936, we announced our plan to exhibit the Camp Transparent Woman on a nation-wide public health educational tour. In the two years since then, this unique figure, the only one of its kind in the world, has been viewed by about five million people, including approximately sixty thousand physicians. We want to thank those members of the medical profession and public health organizations who by their presence, enthusiasm and active cooperation helped make this tour so successful.

TWENTY-FIVE YEARS AGO

(Continued from Page 16)

recommendations, even though of a temporary nature, may be offered for the consideration of the State Board of Health.

Rosenau makes the trite remark that "the relief of bacillus carriers is one of the rewardful problems in preventive medicine," whilst Albert of Iowa City, after reading a very excellent paper on the problem of the diphtheria "carrier" at the last meeting of the American Medical Association last June, which was freely discussed by eminent men, closes the discussion thus: "The number of methods that have been discussed emphasizes one of the conclusions that we made, viz., that no one method has as yet proved satisfactory for the proper treatment of the carrier condition."

Let us briefly consider the situation in California at this time in so far as it concerns diphtheria. . . .

From an Original Article on "Recent Legislation on Communicable Diseases in the United States" by John N. Force, M.D., Berkeley. — It is proposed in this paper to consider some recently published regulations and recommendations in the control of a group of communicable diseases which, for purposes of administration, have been designated as "Class A." These diseases are smallpox, scarlet fever, diphtheria and typhoid fever. In this connection a study has been made of all legislative acts and State Board of Health regulations, bearing on communicable disease control, which have been issued since June 30, 1911. . . .

The California Sanitary Code. The State Board of Health is engaged in the preparation of a sanitary code for California. The first portion of this code to be issued will deal with the control of communicable diseases. It will be supplied to health officers in the form of circulars, which will eventually be assembled in book form with a suitable index. . . .

From an Original Article on "Administrative Measures for the Control of Scarlet Fever" by J. J. Benton, M.D., Berkeley.—The conservation of the health of the community as a whole and the prevention of the spread of disease to the general public constitute the principal functions of the health officer. In dealing with the latter problem his administrative methods for control thereof will, of necessity, vary according as the specific disease falls within one or the other of the two great divisions of infectious or contagious diseases, viz., those the etiology and mode of transmission of which have been scientifically proven, and secondly, those whose causation and propagation have not been conclusively demonstrated. In the first category fall such diseases as diphtheria, plague, tuberculosis, typhoid fever, tetanus, yellow fever, malaria, rabies, etc.; while in the second are to be placed scarlet fever, measles, German Measles, whooping cough, mumps, etc. . . .

On the other hand, in dealing with the second class of infectious diseases—those in which the etiology and mode of transmission have not been scientifically proven—we should be very conservative in our methods and be sure of our ground before accepting new policies. . . .

From an Original Article on "Rating the Efficiency of Hospitals and Institutions for the Tuberculous" by Burt F. Howard, M.D., Sacramento.—One of the provisions of the new law creating a Department of Tuberculosis is that it

(Continued on Page 20)

REGULATION

Regulation of the daily program, especially diet and exercise, is beneficial to normal bowel movement and in some cases of constipation serves as sufficient treatment. Others require additional aid to facilitate regular evacuation . . . When an adjunct to diet and exercise is required, as it often is, Petrolagar provides a mild but effective treatment. Its miscible properties make it easier to take and more effective than plain mineral oil. Further, by softening the feces, Petrolagar induces large, well formed stools which are easy to evacuate. The five types of Petrolagar afford a choice of medication adaptable to the individual patient. Petrolagar Laboratories, Inc., 8134 McCormick Blvd., Chicago, Illinois.

Petrolagar is a mechanical emulsion of pure liquid petrolatum (65% by volume) and agar-agar. Accepted by the Council on Pharmacy and Chemistry of the American Medical Association for the treatment of constipation.

Petrolagar

YES-GOOD WHOLESOME MARGARINE IS ALMOST 100% DIGESTIBLE

TAKE NUCOA FOR INSTANCE-YOU SEE, IT IS 80% FOOD FAT AND EXPERIMENTS ON PEOPLE SHOW NUCOA TO BE OVER 96% DIGESTIBLE[1] ALSO, BECAUSE OF ITS HIGH FAT CONTENT, NUCOA SUPPLIES MORE LASTING FOOD-ENERGY THAN CARBOHYDRATE

1. Holmes and Deuel: Am. Jrl. Physiol., Vol. 54, P. 479. (Confirmed in experiments with New Nucoa by university workers.)

H'MM... THAT IS INTERESTING

YES, AND IN ADDITION, NUCOA IS A HIGHLY NUTRITIOUS FOOD. IT SUPPLIES ABOUT 3300 CALORIES PER POUND AND IS AN EXCELLENT SOURCE OF VITAMIN A—CONTAINING 7500 U.S.P. UNITS PER LB.[2].. IT NEVER VARIES

2. Munsell, Jrl. A. M. A., Vol. 111, P. 250, 1938.

shall be the duty of the director to inspect and investigate all institutions, both public and private, where tuberculous patients are treated. Also he shall prepare annually for each institution a report of its rating on sanitary construction, enforcement of sanitary measures, adequate provision for proper food, etc.

There are certain advantages of such a classification which suggest themselves. First, it is a sort of "taking of stock," as it will give the department more accurate knowledge than is now available as to one essential portion of its equipment for tuberculosis control, viz., the location, capacity and efficiency of hospitals and sanatoria treating tuberculosis.

By the word efficiency we need not understand merely technical success, but also a certain fitness for the desired end. Assuming that we have in every part of the state hospitals and sanatoria which are hygienic as to construction and management, give good food and all that can be desired in the way of nursing and medical attendance, there may yet be ways in which they are not efficient with regard to the problem of tuberculosis as a whole, for example: patients may not go to these institutions in such numbers as to essentially modify the total number uncared for, or they may remain in them too short a time to accomplish a cure or to obtain any adequate educational benefit. . . .

From an Original Article on "The Venereal Disease Problem" by Charles R. Blake, M.D., Richmond.—In a discussion of venereal diseases, I believe that a proper control of prostitution is the proper weapon. Prostitution is the burning question of the day. The interest in this question is nation wide and you can scarcely find any intelligent person who has not been thinking about it and who is not seeking information and advice. . . .

With the abolishment of the "redlight district" in San Francisco and eventually all over the state by law which will shortly be voted on by the people of this state, known as the "Abatement Law," and it will surely win, it will be absolutely up to the boards of health of all cities to formulate a plan, which should be the same all over the state, to exterminate, if possible, all venereal diseases. The police authorities are out of it, as they acknowledge by this law that they are not able to control prostitution or venereal diseases. I do not think there is any way of preventing private prostitution, but with the coöperation of all physicians and the expenditure of some money on the part of all the cities, venereal diseases would soon be under complete control. All cases, women and men, should be treated free of charge, if not able to pay, and should be kept under strict observation until a permanent cure is effected, and if necessary, hospitals should be provided or wards set aside especially for the treatment of all such diseases.

From an Original Article on "The Fifth Annual Conference of State, County, and Municipal Health Officials" by W. A. Sawyer, M.D., Berkeley.—The Fifth Annual Conference of State, County and Municipal Health Officials took place at Venice, California, from October 6 to 11, 1913. The conference was held in conjunction with the Sixteenth Annual Convention of the League of California Municipalities. The first day was devoted to registration, inspection of the manufacturers' and pure food exhibits, and attendance at the opening addresses before the general meeting. . . .

From an Original Article on "Pellagra" by R. W. Harbaugh, M.D., San Francisco.—Pellagra is a symptom complex rather than a disease, characterized by periodical manifestations of gastro-inestinal, skin, nervous and mental changes.

It was endemic in Spain in the year 1735. Cazal in 1762 described it as La Mal de la Rosa. Frapoli, in Italy, in 1771, called it "Pellagra" or "Dry-skin."

It next spread to France and Roumania, being reported in the latter part of the eighteenth century, and has only

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

been recognized in the United States in the last fifty years.

At the present time there exist about 100,000 cases in Italy, 50,000 in Roumania, and fewer numbers in Spain, France, Portugal, and Egypt.

The first case in the United States was reported in South Carolina in 1908. Later cases were reported in Alabama. It has since been reported all over the United States, especially in the southeastern states. We have at present 50,000 to 60,000 cases in the south.

There were 368 deaths from the disease in the United States in 1910. . . .

From an Original Article on "Brief Notes on the Formation and Orthography and Pronunciation of Medical Terms" by Rev. W. H. Mills, Contab.—Some weeks ago Doctor Beason, in the course of an address given by him at one of these meetings, alluded to the fact that, in later life, we often forget, because we don't care to remember them, facts which as medical students we were required to assimilate; and therefore, when some occasion demands a knowledge of those facts, have to relearn them.

In a letter to the London *Spectator,* a few weeks ago, the writer, very properly objecting to such words as "pacificist" and "pacifist" as substitutes for "peacemaker," was unwise enough to suggest, as a better term, "paxamist"—a word which, though, to my amazement, it was commended by the Editor, is not merely a mongrel but also a monster. That letter, however, was not wasted. It called forth a protest from a philologist, who laid down three rudimentary rules for word-formation. "In coining new words," he said, "some regard should be paid to the following principles":

1. The idea, which the new word is intended to express, should be truly connoted in its constitution.

2. Languages, like liquors, should not be mixed.

3. The ordinary rules of grammar should be observed; and, if possible, the result should be euphonious.

These rules are at once very simple and very useful and they go a long way. But I may add one more.

4. In a compound word, made up of two nouns, the union of the nouns may not be interrupted by a preposition. Thus such a word as oothekektomy is wrongly formed:—Ovariotomy, by the way, violates rule 2; it is a mongrel, though some late Latin authors have coined a Latin tome from the Greek Touy. Now, when wrongly formed words have grown into inveterate use, it is very difficult, if not impossible, to alter them; the malformations have mostly to be endured. But, when the question is of recent words, or words as it were in the birth, it is surely most desirable that the rules of word-formation should be rigidly observed: that new words should be constructed on strict etymological lines; that recent malformations should be corrected; that wrongly formed words, claiming acceptance, should be rejected. . . .

From an Original Article on "Artificial Synostosis of the Tuberculous Spine" by James T. Watkins, M.D., San Francisco.—I ask you to ponder these four texts which I quote verbatim from the classics of orthopedic literature.

Bradford and Lovett's Text Book, 1911 edition, "On the Nature of Potts Disease": "It will always be regarded as one of the most formidable of diseases, its long course, the deformity entailed, the severity of the complications and the occasional termination in death give both to the surgeon and to the nonprofessional public a natural dread of the affection."

Henry Ling Taylor's Hand Book on "The Duration of the Disease": The disease is rarely cured in two years, and then only in the cervical spine. In other regions spinal support for four to five years, or more, is necessary. The course in untreated cases is very long—from five to twenty years.

Painter (Goldthwaite, Painter and Osgood): "Diseases of Bones and Joints" on the malignancy of Spinal tuberculosis.

It tends to recur after an apparent cure in a considerable proportion of cases—the average quiescence of cases being twelve and one-half years.

Wullstein, Joachimsthal's Handbuch: "Most authors agree that after the fortieth year of life a cure is no longer to be expected.". . .

TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

From an Original Article on "Recent Advances in the Treatment of Dacryostenosis" by Louis D. Green, M.D., San Francisco.—Operative procedures for the relief of dacryocystitis, by making an artificial communication between the tear duct and the nose, date back to the time of Galen and Celsus, but it is only in recent years that any real progress has been made in this direction.

Probing and slitting the duct and canaliculus, while curative in some cases, usually results in failure besides necessitating a painful and prolonged course of treatment. Extirpation of the sac, though more frequently successful, is also undesirable in that it interferes with or destroys the physiological function of the lacrimal apparatus, often failing to abolish the epiphora and therefore frequently demanding a partial or complete removal of the lacrimal gland, and finally is apt to leave a scar in a rather conspicuous place. . . .

From "The Twenty-ninth Annual Meeting of the Northern District Medical Society."—Was called to order by the President, D. H. Moulton, in the Hotel Sacramento, at 11 a. m., November 11, 1913.

The names of Drs. H. D. Bernard and E. H. Pitts were proposed for membership. Their names were referred to a board of two censors, Drs. J. H. Parkinson and R. A. Peers, appointed by the chair. An address of welcome was then delivered by Dr. S. E. Simmons. . . .

The Society then proceeded to the election of officers for the ensuing year. The following officers were unanimously chosen: President, J. W. James, Sacramento; first vice-president, R. N. Bramhall, Fair Oaks; second vice-president, T. H. Stice, San Jose; third vice-president, C. B. Jones, Sacramento; secretary, E. C. Turner, Sacramento. Censors—W. E. Briggs, A. M. Henderson, Sacramento; W. E. Bates, Davis; D. H. Moulton, Chico; W. S. Langdon, Stockton. . . .

From "Use of Heroin Spreading Rapidly Among Drug Fiends."—Washington, D. C.—According to information gathered by the United States Department of Agriculture, there has been a sudden and very significant increase in the use by persons with a drug habit of the little-known, but very dangerous drug called "heroin." The sales of this drug have recently increased greatly, particularly in those states which have rigid laws preventing the indiscriminate sale of morphin and cocain. Investigation of the subject establishes the fact that many drug victims who formerly used morphin and cocain, and who, under the new laws, find it difficult to obtain these substances, have begun using heroin, the sale of which is not as yet as carefully restricted under state laws. The drug is said to be fully as dangerous as morphin and by many is held to be much worse, for the reason that it occasionally kills the victim outright, and

its habit is far harder to overcome than the use of the other drugs. The Department, pending further action, especially warns all people who are unfamiliar with the drug to avoid all preparations containing the substance and to take it only on the prescription of reputable physicians.

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 80)

of a little boy, scared and worn out by the ravages of the dreaded peritonitis, deprived of the company of his mother on his last ride, who turns his little prayers to his grandmother to please ride with him to the hospital.' Mrs. Volstad was convicted of manslaughter, which may result in a prison term of one to ten years, but her co-defendant, Rev. Wilbur W. Alvis, pastor of the Pentecostal Church of Highland Park, was acquitted. . . . In his ruling, Judge Schott upheld 'the efficacy of prayer' but castigated the two defendants for what he implied was gross negligence on their part for attempting to save the Volstad boy with prayer alone when physicians' diagnosis showed he needed immediate surgical attention. 'It is not the intention of this court to criticize any person who in good faith, regardless of his religious beliefs, attempts to pray and ask the good Lord to heal the sick and afflicted. But this court cannot countenance the tactics used by this defendant Alvis, a self-ordained minister who belongs to that group of religious racketeers of whom there are too many in this small world of ours. In the guise of minister of the Lord he serenaded this sick boy accompanied by a guitar player. Does he return again and pray for him? He does not. Does he inquire as to the boy's health? He does not.'. . . ." (Los Angeles *Daily News,* November 29, 1938.)

"Convicted of three counts of petty theft in connection with what police described as a 'phony healing racket,' Claude Benson, twenty-eight, Negro specialist in voodooism and mysticism, today will come up for sentence in Judge Clarence F. Terry's municipal court. Ralph Whitney, detective sergeant, said that Benson, using the name of Dr. C. B. Findley, went to the home of Mrs. Angie L. Cameron, 3206 Filbert Street, and said he would cure her illness for $15. After Mrs. Cameron paid half the fee, Benson prayed for her, using mysterious gestures, then left a bottle of medicine with her, Whitney said. 'After half an hour, throw this medicine over your left shoulder and you'll be cured,' Whitney quoted Benson as saying. The suspect assertedly warned Mrs. Cameron that 'if you don't send me the other $7.50 I'll put a curse on you and see that the illness returns.'. . ." (San Diego *Union,* December 1, 1938.)

"Denied a new trial, Mrs. Frances Zoffel, forty-five, nurse, convicted with Dr. Clayton E. May of conspiracy to commit an abortion, today faced an indeterminate sentence at Tehachapi Women's Prison. Superior Judge Alfred J. Fritz ordered the sentence to run concurrently with a five-year probationary sentence given her last year for a similar offense." (San Francisco *News,* November 4, 1938.) (Previous entries August and September, 1936.)

"To prevent possible loss by San Francisco doctors in a fake selling scheme, the Better Business Bureau asks that all doctors be on the lookout for 'Dr.' Andrew Dolte, discharged cyclopedia salesman for the F. A. Davis Company, Philadelphia, Pa. Dolte, who represented this company in California for six months, will soon be making local calls, it is believed. His plan is to call on doctors to whom he has made recent sales. 'A new edition is coming out in January,' he states, 'give me your old set and I'll put you down for a new one.' Dolte takes the old set, sells it for whatever he can get, and vanishes. If he comes your way, make an appointment for him to call back, then phone the Better Business Bureau." (*Bulletin, San Francisco County Medical Society,* December, 1938.)

"In the midst of his trial on a charge of practicing medicine without a license, William A. Van Buren changed his

BOARD OF MEDICAL EXAMINERS

(Continued from Preceding Page)

plea from not guilty to guilty, was fined $200. Municipal Judge Twain Michelsen also sentenced Van Buren to six months in the county jail, then suspended sentence on probation, with the proviso he shall not even work in a physician's office during that time. On trial before a jury, Van Burean switched his plea on the second day of his trial at the conclusion of the testimony of the first witness, Mrs. Morris Pearson, an investigator for the State Board of Medical Examiners. Mrs. Pearson testified she went to Van Buren for treatment and that he prescribed for her after she had been examined by another man." (San Francisco *Call-Bulletin*, November 30, 1938.)

"'I paid him $50 and he promised to reduce me at least 25 pounds—but I gained seven pounds,' Miss Ethel Tucker, 1308 North Avenue 57, testified in small claims court this week. 'He said he would reduce me 20 pounds and I lost only three,' Miss Dorothy Sears of Long Beach testified. Miss Thacker said she weighed 160 pounds when Dr. Harry Soforenko accepted her $50 and gave her a receipt reading: 'Paid in full for reducing at least 25 pounds, September 3, 1937.' After taking exercises, shots in the arm and dieting for fourteen months, she said, she weighed 167 pounds. 'They cheated on their diet,' said Doctor Soforenko. On the theory that the receipts constituted guaranties, Judge Joseph Marchetti gave judgments for the plaintiffs." (Los Angeles *Highland Park News-Herald*, October 21, 1938.)

"Two cool bandits who answered phone calls in the office of their victim, held up and robbed Dr. William Edward Glaeser, beat and kicked him when he refused to write them a check for $500 and escaped, leaving the physician and his nurse tied and gagged. The two men, bandaged crudely about the face to hide their identity, entered the office at 196 Guerrero Street yesterday afternoon and asked for treatment of injuries received in an auto accident. When Doctor Glaeser questioned their bandages, one of them pulled a gun and demanded his money and watch, then asked for a check for $500. When the doctor refused they knocked him down and kicked him. Nurse Edith Macue, entering the room, was held at gun point while the robbers took $20 and a watch and then gagged and bound them both to chairs. While the robbery was in progress, the doctor's wife, who had been phoned by neighbors who heard the struggle, telephoned her husband. 'The doctor's out; I'll have him call you,' one of the men said to her. The bound pair were released by a visitor, Miss Ruth Jones, who heard the struggle from an adjoining room, but was afraid to try to reach a telephone." (San Francisco *Chronicle*, November 29, 1938.) Previous entries, May and July, 1932.)

"Charges by the State Board of Medical Examiners that a former undertaker has been treating alcoholics in San Francisco with a deadly South American arrow poison, brought indictments by the Grand Jury yesterday against four persons. Thomas F. Huston, proprietor of the Samaritan Treatment at 1153 Bush Street, and a former mortician, is charged with conspiracy to practice medicine without a license. Also accused are John A. Stevens, an assistant, Ruth Nielson and Juanita Butcher, nurses. The Grand Jury vote was taken following testimony of fourteen witnesses and a summation yesterday by Assistant District Attorney Harry J. Neubarth. The indictments were based mainly on information gathered by Joseph W. Williams and Thomas P. Hunter, special agents for the State Board. Dr. Charles B. Pinkham . . . said last night that investigators found more than 200 complaints had been made regarding the treatment, which consisted of administering nauseating drugs and curare, a poison used by South American Indians to tip their arrows. 'There was not sufficient medical advice,' said Doctor Pinkham. Denying that this is a test case to determine the strength of the Board, Doctor Pinkham said: 'It is no such thing. We are interested in

(Continued on Page 26)

IT'S HEALTHFUL, APPETIZING DINNERS LIKE THIS THAT MAKE THE RY-KRISP

REDUCING DIET

SO SUCCESSFUL..

The dinner shown above is typical of the substantial meals permitted with this new 1200-calorie diet planned by recognized authorities and used by thousands of physicians. Supplied in handy booklet form for distribution to your patients, it overcomes the usual objections to ordinary reducing diets because:

1. It provides for a safe average weight loss (about ¼ pound per day) without starvation methods, supplies adequate minerals and vitamins (with possible exception of vitamin D).

2. It permits the use of the patient's favorite foods, thus assuring rigid adherence to the diet.

3. It simplifies food preparation. The patient can select from regular home or restaurant menus.

Ry-Krisp, so important in any reducing diet, contributes much to the success of this new low calorie diet. Made of whole rye, salt and water, double baked, it is safe, delicious and contains only 20 calories to the wafer. Its high bulk efficiency also helps protect against common constipation.

For free copies of Low Calorie Diet and samples of Ry-Krisp use coupon below.

(Continued from Page 24)

seeing that any institution for cures has sufficient medical advice and that the practice is not dangerous to the public.' The indictments will be returned Wednesday before Presiding Judge Ward." (San Francisco *Chronicle,* November 19, 1938.)

"Death yesterday threatened to forestall the trial of Dr. James E. Shafer, seventy-four, Berkeley physician, charged with performing an illegal operation. When the case came up for trial in the court of Police Judge Oliver Youngs, postponement was asked by Doctor Shafer's attorney on the plea that the physician was dangerously ill. Disturbed at the many delays, Judge Youngs ordered the trial transferred to Doctor Shafer's home at 2185 Woolsey Street. There the physician was found in a comatose condition, unable to answer questions of his counsel. The trial was postponed until March 2. Doctor Shafer is accused of performing an illegal operation on Mrs. Lee Etta Bruce, twenty, of 21681 Montgomery Avenue, Hayward. His nurse, Mrs. Erol Ward, forty-eight, also was named a defendant." (San Francisco *Chronicle,* December 2, 1938.)

"Dr. Francis D. Coltrin, a Fullerton physician, is now at home, having been granted a parole by the State Board of Prison Directors at their meeting on November 17, members of the family announced today in correction of a report that a sentence of ten years had been set in connection with an asserted illegal operation and the death of a sixteen-year-old Santa Ana high school girl more than two years ago." (Fullerton *News-Tribune,* November 25, 1938.)

"A little more than five years ago, Karl J. Weberg, Pasadena chiropractor, was acquitted on a murder charge which grew out of an illegal operation he was alleged to have performed. Yesterday in Justice Court, Weberg was arraigned on three counts of performing illegal operations. The chiropractor, who is reported to have a large practice in Pasadena, was arrested late Tuesday night by members of the police department vice squad following an extensive investigation. The formal complaint against Weberg alleged that he performed illegal surgery on a woman in June, 1938, and on another woman on two different occasions—in September, 1936, and in September, 1938. Both women are married. . . . Charges of murder and illegal surgery were filed against Weberg in January, 1933, following the painful death of a young, unmarried woman upon whom he was alleged to have performed an unlawful operation. The case was sensational and did not end until March 7, 1933, when a jury acquitted the chiropractor. . . ." (Pasadena *Independent,* November 4, 1938.) (Prior entries July, August, September, 1926; February, 1928; April, 1936.) The records of the Board of Medical Examiners indicate that Karl Weberg, asserted former member of the Pasadena Fire Department was, in 1922, one of the incorporators of the Pasadena College of Chiropractic, which he served as President, his name assertedly being listed in the faculty as in charge of the "Department of Philosophy."

"Milton T. Euler, sixty-seven, San Francisco, was found guilty Wednesday in Hayward justice court of giving medical treatment without a state physician's license. A jury deliberated an hour before bringing in the verdict. Mr. Euler faces a maximum sentence of six months in jail, $500 fine, or both, when he comes up before Judge Jacob Harder for sentence next Monday. Mr. Euler on the stand claimed his true name was Uhler, but admitted he has used both. . . . He explained the presence of "Dr." on his stationery and business cards by saying that as a boy he was christened Dr. Milton Taylor after a famous New York physician. Thomas P. Hunter, special agent for the State Board of Medical Examiners, worked up the case against Mr. Euler." (Hayward *Review,* December 1, 1938.)

Cosmetics and Your Patient's Morale

THE DOCTOR IS OF NECESSITY A STUDENT OF LIFE Each new patient presents a new study, a new problem. Psychology plays an important role in the course of treatment he prescribes With some patients he must be frank to a point of harshness, with others he must be gentle and coaxing. The nature of the illness and, more particularly, the nature of the patient determine his attitude He knows from experience the value of bolstering his patient's morale. As a student of psychology he knows that few things are more depressing to a woman than the fear that she is losing her charm, that when she no longer cares how she looks the chances are she has lost touch with a vital interest in life. And because he appreciates the importance of a sensible interest in personal appearance he quite rightly encourages his patients to look their best at all times. FINE COSMETICS appeal to that interest That is why they deserve to be recommended by doctors who are, after all, greatly concerned with their patient's morale.

LUZIER'S, INC., MAKERS OF FINE COSMETICS & PERFUMES

KANSAS CITY, MO.

"A woman with an alleged penchant for signing names of physicians to checks for various amounts was named in a document issued by the district attorney, charging forgery. The complaint charged that a 'Mrs. J. W. Hynde' admitted to Sgt. Frank Beatty and Lt. O. C. Simmons, of police, that she had signed the name of Dr. E. H. Crabtree, November 23, to a check with which she purchased several articles of wearing apparel from a downtown store. Attached to the complaint, as additional evidence, were checks purportedly signed by Dr. A. L. Barr and Dr. W. O. Weiskotten, which the district attorney was informed were forgeries. Preliminary hearing of the case has been set for December 14 in municipal court. Writer of the checks was identified as an employee of a credit establishment, the district attorney commented." (San Diego *Tribune*, December 2, 1938.)

"Dr. George (Glenn) Granger White, Pacific Highway druggist, who was convicted by a jury on four counts of practicing medicine without a license, today was given a $1,000 suspended fine by Municipal Judge Eugene Daney, Jr., on condition he leave the state. White, it was brought out, formerly was a licensed physician, but had his permit revoked in 1937 by the State Board of Medical Examiners for malpractice. The jury found that recently White had been administering to several persons and had not had his license reinstated to him. Daney instructed the defendant to dispose of his San Diego property, including the drug store and Alpine land, and to leave the state as soon as possible. The ex-physician's plea to retain hypodermic needles for his own use was rejected by the court. Daney did, however, allow White to live with his son in Los Angeles for sixty days pending disposition of his San Diego holdings." (San Diego *Tribune*, December 2, 1938.) (Prior entries February, March and July, 1937.)

"Standing before the court with trembling hands, Dr. Clarence C. Chappelle, 66-year-old San Jose physician, yesterday pleaded guilty to a charge of performing an illegal operation upon an Oakland girl, October 7, and asked for probation. Superior Judge William James, before whom Doctor Chappelle appeared, continued the case until Friday in order to receive the report of Adult Probation Officer Max Watson. The elderly physician had practiced medicine for thirty years until his license was revoked recently by the State Medical Board on charges of performing an illegal operation on a San Francisco woman. At liberty under a $10,000 bond, Doctor Chappelle changed his plea to guilty yesterday after having pleaded not guilty after his arraignment. . . ." (San Jose *Mercury-Herald*, December 6, 1938.) (Prior entries December, 1938.)

"Paul DeGaston, one-time San Francisco art photographer, has fallen behind $2,040 in payments to his first wife for the support of their children—but he has found means to be married eight times since his first divorce. In a move to collect the $2,040 and also to modify the terms of their decree, Mrs. Leona DeGaston of Los Angeles, wife No. 1, made this allegation before Superior Judge C. J. Goodell here yesterday through Attorney Delbert W. Radke. At the time of the divorce, in 1923, Mrs. DeGaston was awarded custody of the children, Barbara and Gloria, and $60 monthly for their care as long as they remained in the Bay Area. In yesterday's petition, Radke pointed out that DeGaston has now moved to Los Angeles, and therefore, since he is in the same vicinity as the children, he should be ordered to pay the $60 monthly there. Judge Goodell issued an order for DeGaston to appear before Superior Judge I. L. Harris on December 16 and show cause why his wife's petition should not be granted, and why he should not be held in contempt of court for the alleged deficit of $2,040 in support money." (San Francisco *Examiner*, December 9, 1938.) (Prior entries October, 1934; February, 1935; July, 1936.)

Although bone conduction seems to be the active cause of ear degeneration, air condition likewise has been found to be responsible for deafness and deterioration of the auditory apparatus.

Alcoholic
. . and . .
Narcotic
Addiction
Diseases

Cedar Lodge maintains facilities conducive to the successful treatment of these afflictions and caters to the higher type patient who is capable of regaining his rightful place in business and society if freed from his addiction.

Treatment administered by competent physicians and sympathetic assistants. No harsh methods used. Secluded in three acres of beautiful grounds. An environment conducive to mental and physical healing.

Bequest Forms: Unto the California Medical Association*

FORM OF CLAUSE OF WILL PROVIDING FOR CASH BEQUEST

I hereby give and bequeath unto Trustees Of The California Medical Association, a nonprofit corporation of California, the sum of $——— to be known as the ——— Gift, to be used and expended by said corporation for scientific, educational, or hospital purposes.

* * *

FORM OF CLAUSE OF WILL PROVIDING FOR CASH BEQUEST

I give and bequeath unto Trustees Of The California Medical Association, a nonprofit corporation of California, the sum of $———, to be held as a fund, to be known as the [here insert name desired] Fund, the principal whereof shall from time to time be invested to the best advantage compatible with safety, and the income whereof shall be used and applied for scientific, educational, or hospital purposes.

* * *

FORM OF CLAUSE OF WILL PROVIDING FOR BEQUEST OF PERSONAL PROPERTY

I give and bequeath unto Trustees Of The California Medical Association, a nonprofit corporation of California [here describe the property], the same, or the proceeds thereof, to be held as a perpetual fund, to be known as the [here insert name desired] Fund, the income whereof shall be used and applied for scientific, educational, or hospital purposes. The said corporation shall have the power to sell said property and to invest and reinvest the proceeds arising from the sale thereof from time to time as it may deem advisable for the purpose of producing as large an income as may be compatible with safety.

* * *

FORM OF CLAUSE OF WILL PROVIDING FOR DEVISE OF REAL PROPERTY

I give and devise unto Trustees Of The California Medical Association, a nonprofit corporation of California, to aid and further its scientific, educational, and hospital purposes, and to be known as the ——— Gift, the following described real property situate in the County of ———, State of California, and more particularly described as follows, to wit:

* * *

FORM OF CLAUSE OF WILL PROVIDING FOR DEVISE OF REAL PROPERTY

I give and devise unto Trustees Of The California Medical Association, a nonprofit corporation of California [here describe the property], the same, or the proceeds thereof, to be held as a perpetual fund, to be known as the [here insert name desired] Fund, the income whereof shall be used for and applied to the support and maintenance of scientific, educational, or hospital purposes. The said corporation shall have the power to sell said property and to invest and reinvest the proceeds arising from the sale thereof from time to time as it may deem advisable for the purpose of producing as large an income as may be compatible with safety.

---

* These Bequest Forms were discussed editorially in CALIFORNIA AND WESTERN MEDICINE, for March, 1936, p. 145, and June, 1936, p. 460.

Behind

MERCUROCHROME

(dibrom-oxymercuri-fluorescein-sodium)

is a background of

Precise manufacturing methods insuring uniformity

Controlled laboratory investigation

Chemical and biological control of each lot produced

Extensive clinical application

Thirteen years' acceptance by the Council of Pharmacy and Chemistry of the American Medical Association

A booklet summarizing the important reports on Mercurochrome and describing its various uses will be sent to physicians on request.

Painstaking
laboratory investigation and
thorough clinical study
are the heritage of each Lilly Product.
Such a background
leaves but one obligation to be fulfilled.
Carefully planned marketing
must place control of the drug in the
hands of the physician.
Lilly Products are distributed
only through ethical
channels.

EPHEDRINE INHALANTS, LILLY

Ephedrine, topically applied to inflamed nasal mucous membrane, relieves congestion and facilitates drainage. The following preparations contain 1 percent ephedrine and are intended for use in the nose:

INHALANT EPHEDRINE COMPOUND—contains camphor, menthol, and oil of thyme.

INHALANT EPHEDRINE PLAIN—supplied without aromatics.

EPHEDRINE JELLY—contains eucalyptol in a water-soluble base.

L. J. FLYNN, 544 Market Street, San Francisco (DOuglas 0577)

Copyright, 1939, by the California Medical Association

Subscription prices, $5 ($6 for foreign countries); single copies, 50 cents.

Volumes begin with the first of January and the first of July. Subscriptions may commence at any time.

Change of Address.—Request for change of address should give both the old and the new address. No change in any address on the mailing list will be made until such change is requested by county secretaries or by the member concerned.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the Journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this Journal. New copy must be sent to the editorial office not later than the fifteenth day of the month preceding the date of publication.

Contributions—Length of Articles: Extra Costs.—Original articles should not exceed three and one-half pages in length. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—CALIFORNIA AND WESTERN MEDICINE has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested that contributors to this Journal write to its office requesting a copy of this leaflet.

EDITORIALS†

"CALIFORNIA PHYSICIANS SERVICE"—A STATE-WIDE MEDICAL SERVICE PLAN: AUTHORIZED BY THE CALIFORNIA MEDICAL ASSOCIATION

"California Physicians Service."—"Proposed Voluntary Medical Service Plan" was the caption to some editorial comment which appeared on page 426 of the December, 1938, issue of the OFFICIAL JOURNAL. The call for a special session of the California Medical Association House of Delegates was made known on page 470, and references to other articles were given in a footnote.

The House of Delegates convened in Los Angeles on Saturday, December 17, continuing its two days' session through Sunday afternoon, the 18th. By a vote of 114 delegates in favor and 12 votes against, the House of Delegates, as the supreme body in the California Medical Association, acting through delegates who were the representatives of the component county societies, went on record as favoring the institution of a voluntary medical service organization, to be known as the "California Physicians Service." The necessary enabling resolutions and instructions to the Council, authorizing the latter group to proceed with the skeleton plans that had been presented, were adopted by the House, with definite majorities.

The Council and its Special Committee, therefore, will continue along the lines laid down in the plans there submitted to the House by the Council on December 17 and 18. The Council will hold its next meeting on Saturday, January 14, to consider and act upon progress reports then to be presented. Suggestions from members are cordially invited.

* * *

A Nonprofit Medical Service Plan: Some of Its Provisions.—It is still too early to convey much information of a final nature on the details of this epoch-making plan, but it is hoped that, in the February issue of CALIFORNIA AND WESTERN MEDICINE, or through a separate brochure, a fairly complete report will be available for members of the California Medical Association. In the meantime, it may be well to keep in mind that the tentative plans contemplate inclusions such as the following:

---

† Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

A medical service, with hospitalization, of statewide scope; but a service instituted through local or regional units, such as counties or districts, in which due recognition will be given to environmental factors obtaining in the areas involved. The extent to which the physicians in each region express their desire to coöperate will be determining elements in the selection of the districts where the plans will first be put into active operation.

Every physician possessing the degree of Doctor of Medicine and having a valid certificate from the Board of Medical Examiners of the State of California, may make application to be listed as a "professional member" of "California Physicians Service," the name which will probably be given to this new nonprofit medical-service corporation. The proposed organization, therefore, will in no sense be a closed corporation.

The incorporators, for purposes of convenience, will be the present members of the Council of the California Medical Association. The incorporators will become the first administrative members. The first board of trustees will be designated in the articles of incorporation, as is required by law, and will be certain of the members of the California Medical Association as yet to be designated by the Council. When the terms of the first trustees expire, the administrative members will elect their successors. As soon as possible after incorporation, the incorporators will resign as administrative members and be replaced by administrative members elected by the membership of the County Medical Societies from geographical districts.

Professional members will pay a certification fee of five dollars at the time when application for such membership is made. The House of Delegates authorized the Council to loan the new corporation a sum up to fifteen thousand dollars, to cover expenses incidental to putting the plan into operation.

The citizens of certain income groups (the classes still to be decided), who wish to secure for themselves medical service on a periodic payment basis, and who make application, will be known as "beneficiary members." Monthly or other periodic payments received from beneficiary members will be under the custodianship of the board of trustees of the nonprofit medical service association and the board of trustees will be required to set aside a certain portion thereof as a permanent reserve fund to meet emergencies, and another portion thereof to cover necessary administration expenses, this to be kept as low as possible, the remainder to be used to pay professional members and hospitals for services previously rendered.

The payments to the physicians who are registered as professional members and who have submitted statements for professional services rendered to beneficiaries, will be on the unit basis. The "unit" and the frequency of such payments, *i. e.*, whether monthly, quarterly, etc., are still to be determined.

Adequate Medical Service of Proper Standard Will Be Available Through This Plan.—It would be possible to continue at great length, giving details such as the above, but, at this time, it is not necessary. Suffice it to say, that this nonprofit medical service organization will come into corporate being in the not distant future, as one that aims to give medical service of highest standard, to those citizens of California who, under present-day conditions of living, find it an increasing hardship, and at times an impossibility, to meet the expenses incident to unforeseen and unpredictable illness.

It is to be remembered that many of the citizens in the groups under consideration have found it impossible for some time past properly to recompense physicians for the professional services that have been rendered. If the California Physicians Service, therefore, can place in operation a medical service plan with a big mass spread, then it should be equally possible for a large number of citizens to receive adequate medical care at a cost so comparatively low as to be quite within their means, at the same time making it feasible for the physicians, who generously render the aid, to receive in payment, cash, and in amount, as great, or perhaps more than that they receive by and large, under present conditions.

* * *

Other Articles in This Issue of the Official Journal.—On other pages* in this issue will be found additional articles and reports, with newspaper editorials and press items which appeared when the action taken by the California Medical Association through its House of Delegates was first made public; and all these are commended to the consideration of readers of the OFFICIAL JOURNAL. In the February issue also, more detailed information will be presented. In the meantime members of the California Medical Association who have not paid much attention to these problems of medical service to certain income groups, or who have not kept in touch with recent reports appearing in the OFFICIAL JOURNAL, are requested to withhold their judgment of the proposed plans until they have had opportunity carefully to look over and study the final plans for inauguration of the service.

ANNUAL SESSION PAPERS, EXHIBITS, AND FILMS

Information Concerning Scientific Papers, Exhibits, and Films.—On January 8, the annual joint meeting of the California Medical Association Committee on Scientific Work and the secretaries of the twelve scientific sessions of the Association will have been held, and the general nature of this year's coming annual session programs outlined.

The attention of prospective essayists, therefore, who have not yet done so, is called to the importance of immediate communication with the proper Section Secretaries concerning submission of articles they have in mind.

---

* For additional information on matters here commented upon, see pages 35–48.

Members who also desire to present exhibits or films should write to the Association Secretary, giving all helpful information about them. Those who have had films made on medical and surgical studies will do well to send to the Committee* the necessary data, so that arrangements may be made, if possible, for proper allocation of exhibit space or for presentation in the cinema booth, on certain days and at definite hours, of the photographs available. Prompt coöperation in these matters will be appreciated, since it will aid in making the 1939 annual session, to be held at Del Monte on May 1-4, one of the most profitable and enjoyable of all series of meetings.

Finally, members are urged to make their plans now for attendance, since problems of vital importance to medical practice in California will come up for serious consideration.

ON GRAND JURY INTERPRETATIONS OF MEDICAL ETHICS

Laymen Find It Difficult to Interpret Professional Ethics.—Physicians often find it difficult to explain to themselves the seeming incapacity of many of the laity and their organizations to understand why it is necessary for the medical profession, in its efforts to promote and maintain proper medical and hospitalization standards, to lay down very definite rules for its disciples and their institutions.

Come now, recently, some of the governmental agencies, in different sections of the country, who so misinterpret the basic reasons for the qualifications and restrictions of membership in county medical societies and on hospital staffs, that the federal antitrust laws are brought forward to make demands for changes that are little else than trade rules for admittance to membership.

* * *

County Society Membership.—Consider, first, this matter of membership, in a component county medical society. Physicians are part of a learned profession which, through its own efforts and at great effort, in most commonwealths of the Union has been able to have inserted into many state medical practice acts, educational qualifications in harmony with those maintained by the approved medical schools of the United States. To do this, however, has meant recurrent battles in almost every legislative session. Take, for example, our own State of California: from the very beginning, we have been forced to give battle to those who would lower those standards of professional training, so necessary to observe and live up to, if the public health is to be properly safeguarded.

Each of the component county societies, that make up the California Medical Association, accepts only those physicians who have had qualifications that permitted them to take and pass an examination by the Board of Medical Examiners of the State of California. But more than that is really necessary because, in one sense, a component county medical society can do its work to best advantage, provided its members have not only the educational background of proper standards, but possess also other attributes that make them harmonious and desirable units in the organization.

Physicians are an educated group of citizens, and they do not find it advantageous, for professional advancement or pleasant fellowship, to be associated with persons of deficient professional attainments, or who, because of certain character or temperamental attributes, are uncongenial. Such individuals have the right to practice the healing art, in so far as laws give them authority, but they certainly have no right legally to demand admission to membership in an organization in which harmonious outlook on mutual scientific, economic and other problems is necessary, if the organization is to do its work to best advantage. Likewise, as in similar organizations, when an individual who has been admitted engages in activities out of harmony with the organization, he might well resign. It is not to be wondered at, under such conditions, that steps have been taken to secure expulsion from membership, when violation of constitution and by-laws has been demonstrated on the part of such individuals.

* * *

Hospital Staffs.—So also as regards hospital staffs. The modern-day standards of hospital practice were voluntarily brought into being by physicians, in conjunction with the Council on Medical Education and Hospitals of the American Medical Association and of the American College of Surgeons. In hospital practice there is a very intimate personal association between members of a learned profession. The hospital also represents a certain amount of capital investment and, in proportion as it has a staff of harmonious attending physicians and surgeons, is able to that degree to give a better type of service to the patients who seek admission. Physicians who are inharmonious elements, as staff members of high standard hospitals, are not prevented from taking their patients to other hospitals. They are simply denied the right to lower the tone and service of hospitals, whose attending staffs look upon them as uncongenial elements. Such individuals should ask themselves the question: What is wrong with me? and what am I doing that makes other physicians wish to avoid intimate professional affiliation with me?

* * *

Advent of the Antitrust Law Argument.—Thoughts such as the above could be elaborated, did space permit. It is strange, in one sense, that there should now come, at the special instance of certain members of the legal profession, the promulgation of the doctrine, that the rules which physicians have laid down for themselves, in their efforts to provide high educational and other standards for medical licensure and hospital staff membership, are one and the same, with certain provisions on the statute books, placed there in years gone by, and designed to prevent restraint in trade; and that demand is now made that these practices of a learned profession, of such excellent purpose, must be discontinued because they are a violation of the trade antitrust laws!

---

* Names of the State Committee appear in the roster on advertising page 2; and of Section secretaries on advertising page 6.

It will be interesting to note the outcome of some of these recent events, so prominently colored in the generous publicity that has been given thereto. Here also, it may be well to wait and see.*

---

* Apropos of the above, the attention of readers is directed to some press clippings which appear in this issue, on pages 70–74.

POSTGRADUATE CLINICAL CONFERENCES

Tentative Plans for Spring Postgraduate Conferences.—In previous issues of California and Western Medicine attention was called to the postgraduate brochure which appeared as a supplement to the October issue of California and Western Medicine. The subject is again brought forward as a reminder to component county societies to appoint local committees on postgraduate courses, with whom the California Medical Association Committee on Postgraduate Activities, in proper time, may correspond, when itineraries of the visiting speakers and clinicians are being formulated.

A tentative plan, now under consideration, contemplates the formation of a number of visiting teams, one for the northern counties, one for the central valley region, and a third for the southern portion of the state. If proper coöperation is given, it may be possible to have a different team go out, once each month for, say, a series of three months, holding one or two-day clinics in several cities, each team making its circuit in about one week, whereby each month a different group of topics would be presented. Such a series of meetings could be made of great interest and real value.

Program committees of county societies are requested to keep these plans in mind. With proper coöperation it should be possible to at least try out these proposals. Correspondence with the Association Secretary, who is also the secretary of the Committee on Postgraduate Activities, is invited.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 35.

The selection of activities to be carried on within each state has been left largely to the state health departments. Each state health officer has the privilege of originating such plans as he may consider best for his state. While these plans must be submitted to the Public Health Service for approval before they become effective and before the payment of federal funds may be made, it has been the policy of the Public Health Service to give its approval to any plan that may be considered scientifically sound and which gives promise of an adequate return on the investment.—C. E. Waller, United States Public Health Service.

EDITORIAL COMMENT†

THE IDENTIFICATION OF FUNGI CAUSING DISEASE IN CALIFORNIA *‡

Molds play a definite rôle in the production of disease and, in recent years, have received increased recognition. This is particularly true in California, where the incidence of Coccidioidal infection directs attention to pathogenic fungi. The symptoms and signs of fungous diseases are complex and beyond the scope of this paper. There are, however, certain biologic aspects of fungous diseases that merit attention. These aspects are not only interesting from the standpoint of biology, but they raise questions that are of practical importance to the physician and to the public health official. Considering Coccidioidal granuloma specifically, but with fungous diseases generally in mind, there are three questions to which your attention is directed:

First: How are the infections acquired, and how do the organisms maintain themselves?

Second: How do the fungi behave in culture solutions, as compared with other type of pathogenic organisms?

Third: How reliable are skin tests, complement-fixation reactions or other serologic procedures for diagnosis?

Considering the first question: How are infections acquired? Practically all infections are chance infections. We do not see epidemics of fungous diseases as we do in microbian and virus infections. The microbian and virus diseases maintain themselves through the agency of hosts or infection chains. Tetanus and botulism, however, are exceptions to this rule. The agents of fungous diseases are not true parasites, but are "pathogenic saprophytes." The possible exceptions to this are the dermatophytes. The infectiousness that is characteristic of a true parasite is lacking—especially with Coccidioides immitis. There are over five hundred cases of Coccidioidal granuloma on record in the State of California since 1894: *None* of these cases has been traced to a preëxisting infection. The ability of Coccidioides immitis to exist and to multiply in the inanimate world is fully developed, and this fungus may be found in the soil of the regions where the disease is most prevalent.[1] Coccidioides grows and flourishes on grass, potatoes, carrots, cactus, and on pieces of decayed wood. Such an organism must be widespread and

the portals of entry into the animal tissues are numerous. When this organism gains entrance into animal tissues it may behave like a true parasite. What conditions or what factors bring about this change? Within the answer to this particular question may lie the possible explanation of the pathogenesis of Coccidioidal granuloma and other fungous diseases.

How do fungi behave in culture solution when compared with other types of pathogenic organisms?

The answer to this question is best shown by comparing the metabolism of three pathogenic molds with the metabolism of a Bacterium, a Protozoan, and an Actinomycete. Metabolism studies have been carried out on all of these types by various investigators. It is important to remember that all of the investigators used the same biochemical methods and the procedures followed in the analyses were almost identical. Each investigator used media rich in protein or nitrogenous material, and the metabolism of each organism was studied in the presence of glucose and in the absence of sugar. This procedure demonstrated the effect that the consumption of glucose had upon the protein metabolism. The table presented has been prepared from data obtained from the original reports of the different investigators. The actual numerical values are omitted, and arrows are substituted so that the *direction* of the metabolic changes may be clearly indicated. Arrows pointing upward and downward are used to show the rise and fall in the values of the fractions given. Solid or black arrows are used for emphasis and to draw attention to the molds. Only four of the usual partitions that are studied in metabolic experiments are given. This is in the interest of clarity, and the essential differences are seen in these four fractions. Full numerical values for all partitions, such as amino-nitrogen, polypeptid nitrogen, etc., may be found by consulting the original reports where full discussions of methods, procedures, and interpretations are set forth.

All of the organisms are well-known pathogens. The names of those who conducted the original investigations are given in parentheses. Let us compare the metabolism of these different types of organisms first, when no sugar is present in the medium and, second, when glucose has been added.

Metabolism in the Absence of Glucose.—The metabolic activity is marked by an increase in the degree of alkalinity and also by the amount of ammonia produced. This is true for all types. The volatile acids decrease in the case of the molds—probably because these compounds serve as satisfactory sources for carbon.

Metabolism in the Presence of Glucose.—Here the metabolism is seen to differ in the case of the molds from all of the other types. It is important to notice that all organisms consume glucose—this is shown by downward direction of the arrows. The utilization of glucose by the fungi does not produce an acid medium, as it does in the case of the other types. The values for volatile acids again fall during the growth of the molds, but rise in the other types. These differences cannot be overemphasized. They prove that molds do not metabolize their nutrients—especially glucose—as do the bacteria. Additional experiments in the metabolism of Coccidioides immitis and Blastomyces dermatitidis have shown that the *composition* of the medium determines the final acidity or alkalinity and *not* the utilization of glucose. This observation invalidates the customary procedure for the identification of molds by sugar reactions. In such methods various sugars are incorporated into media and an indicator is added, after adjusting the medium to a definite p^H. When the indicator shows that acid is present, we have assumed that this is synonymous with sugar consumption and our reports have been so recorded.

To complicate the situation even more, definite evidence exists that the composition of the medium determines the color, form and texture of the molds.[7] Dowding and Orr[8] have shown that no correlation can be made between the clinical types of "ringworm" and the character of the mold isolated and grown on Sabouraud's medium. The influence of slight changes in the culture solutions has an effect upon fungi that exceeds any that we are accustomed to see in the field of bacteriology. It is not possible to control the variations in the commercial peptones and meat extracts that form the bases for the usual culture solutions. It is little wonder, then, that there is confusion in the literature dealing with medical mycology. Chemically defined culture solutions, not necessarily inorganic, offer the best type of media. Such media can be duplicated anywhere, and provide a common standard of environment to which physiologic activity and morphologic description can be referred. To continue the use of bacteriologic procedures for cultivation of molds will add to and prolong the existing confusion.

Finally, we come to the consideration of the third question, and this concerns the reliablity of skin tests, complement-fixation reactions and other serologic procedures. The fungi again refuse to abide by the rules and create further problems for the immunologist. The present state of affairs may be summarized by saying that the *specificity* of serologic reactions remains to be proved, and that the *reliability* of serologic procedures has not been adequately demonstrated. In California we are particularly interested in the "skin test" for the diagnosis of Coccidioidal infection. Recent experimental work at the University of California indicates that all is not well with this test. Patients who have been proved to have Coccidioidal granuloma by culture, by animal inoculation and by pathologic examination, have repeatedly failed to give positive skin reactions with standard preparations of Coccidioidin, while other patients have given positive reactions with the same preparations. Guinea pigs have been inoculated with different cultures or strains of Coccidioides, and antigens have been made from these cultures. All animals have died with the typical lesions of Coccidioidal granuloma. The striking result has been that positive skin tests were obtained in these animals only when they received injections of coccidioidin made from the particular strain with which they were infected. Some cross reactions did occur, but they were mild and transitory. This suggests that we must use polyvalent antigens in making our tests. But the question immediately arises, "How many strains must be put into the antigen?" That question cannot be answered until we know how many strains of Coccidioides there are and what cross reactions take place.

After considering the three questions that have been raised, we arrive at this conclusion: Molds play their own game according to their own rules, and we have not yet learned how to "play ball" with them.

SCHOOL PHYSICAL EXAMINATIONS

Discovery of Defects Not the Only Value of the School Physical Examination.—It is too often assumed that the detection of physical defects is the only objective of the periodic examination of school children. Undoubtedly, this is one of the most valuable features of this procedure, and when the discovery of defects is promptly followed by measures for correction, an immense amount of good is accomplished.

School Physical Examination of Value as a Health-Education Experience.—There are, however, many other values inherent in this examination. The physical examination of school children by a school physician is health-education experience of major importance. In the first place, a favorable attitude is developed toward the fundamental idea of having one's health appraised by competent physicians at regular intervals. The dental profession has made commendable progress in educating the public to prevent dental trouble by consulting the family dentist at regular intervals. One of the next great steps forward in preventive medicine will be made when the public are brought to realize that a periodic check-up of nutrition, heart, lungs, kidneys, etc., by the family physician is just as important as the biannual visit to the dentist.

In the second place, favorable attitudes toward health itself may be established. The school physician does not merely point out the defects which are discovered, but rather commends the fine points in the physique of the child who is being examined. Very often a small spark of self-respect is thus fanned into a glowing purpose to achieve optimum health. Many physical imperfections, especially those that result from faulty health habits, may be corrected by presenting to the child a health ideal, and describing in simple terms the road by which this ideal may be attained. In the physical examinations of school children the school physician has the advantage over all other school health workers, inasmuch as he is a doctor and as such speaks with authority on health matters. Even as early as the kindergarten age most children have been conditioned to accept the authority of physicians on matters of health. This creates a great opportunity and a great responsibility.

The Carry-Over Value of the School Physical Examination.—In recent years our school program is being evaluated on the basis of its carry-over value into adult life. The public are asking, "Are the school educational experiences fitting our young people to step out into life and meet its challenges?" The school physical examination is educating our children to keep their bodies fit by living in accordance with the laws of health and by seeking advice at regular intervals from competent physicians and dentists. This is "carry-over" of an enduring character.

School Examinations Help to Indicate Health Values of the School Program.—Furthermore, as Chenoweth and Selkirk have recently pointed out, "even though competent service is given some children by personal physicians, the school examinations are still of value in giving a picture of the health of the school as a whole, and in showing the effect of the school program for good or ill. They may indicate the need for radical reforms in such matters as hours of attendance, periods of rest and relaxation, the school midday meal, the amount of home work, and other parts of the program."[1] The other parts of the program referred to above might well include the physical education program. The physical examination of school children, if adequately performed, should provide information as to the soundness of these activities. Are we placing the emphasis on the right type of activity? Are the present basketball rules resulting in a game which is too strenuous for the adolescent boy? Are too much time and effort being devoted to football? Would emphasis on other athletic activities have greater health values? Help in solving these problems should be obtained from careful physical examinations by skilled school physicians.

The Function of the School Physician Is Health Supervision and Health Education.—School physicians are sometimes criticized for not making definite diagnoses in connection with obscure conditions affecting school children. The public forgets that private physicians in similar cases only make a diagnosis after a complete physical examination, together with most exhaustive laboratory investigations. School physicians, from the nature of their work and experience, become expert in observing the normal growth and development of children. They are alert to detect slight deviations from normal, the earliest symptoms of physical abnormality or disease. In such cases only time or the complete laboratory service at the disposal of the family physician or clinic will elucidate the diagnosis. The school physician is not in the school to take the place of either the family physician or the clinic physician; he is there to guide the children along the road to health. Along this road the family physician and dentist are exceedingly important in providing personal supervision of health and physical rehabilitation by treatment when necessary.

---

[1] Chenoweth and Selkirk: School Health Problems, p. 154. F. S. Crofts & Co., Inc., New York, 1937.

Chenoweth and Selkirk have admirably analyzed the situation as follows: "The school examination aims not at making diagnoses, but at pointing out the need for medical supervision when necessary. Its purpose is not to provide advice as to treatment even for the indigent class, since this consumes too great an amount of time and is more efficiently handled by other means. The health examination is essentially an effort in health education to establish suitable attitudes in the child and his parents, and to act as a motivating force for healthful living. By the school examination, however, masses of children are examined who would otherwise be passed by, a multitude of defects are discovered which would otherwise pass unnoted, and correction is instituted in vast numbers of cases."[2]

Physical Findings of Physicians of Value to the Classroom Teacher.—A great deal of the value of the school physical examination may be lost if the information obtained by the school physician is not made available to the teachers. Every effort should be made through health coördinators, or someone functioning in that capacity, to see that the findings of the school physicians are passed on to the classroom teacher. Defects of vision, hearing, heart, and malnutrition, etc., create classroom situations and problems which can only be handled intelligently when the information obtained by the physician is made available to the teachers.

In these days, half our diseases come from the neglect of the body in the overwork of the brain. In this railway age the wear and tear of labor and intellect go on without pause or self-pity. We live longer than our forefathers; but we suffer more from a thousand artificial anxieties and cares. They fatigued only the muscles—we exhaust the finer strength of the nerves.—Bulwer.

With stupidity and sound digestion men may fret much; but what in these dull unimaginative days are the terrors of conscience to the diseases of the liver.—Carlyle.

PROBLEMS IN THE DIAGNOSIS OF ACUTE APPENDICITIS*

By Thomas O. Burger, M. D.
and
Harold C. Torbert, M. D.
San Diego

Discussion *by E. H. Eiskamp, M.D., Watsonville; John Homer Woolsey, M.D., Woodland.*

Failure to diagnose acute appendicitis promptly and correctly was the subject of the chairman's address by the senior author[1] before the Section on General Surgery of the California Medical Association in 1926. A review of 449 cases of acute appendicitis seen in our practice during the past ten years offers unhappy evidence that surgical intervention is still too often delayed by faulty diagnosis. The seriousness of a situation which results in high mortality rates during so recent a period indicates vividly the need for continued attention by the profession to this whole matter. It is our purpose, therefore, to review in some detail the results of our study of the ten-year case series, in the hope of pointing out some of the pitfalls actually encountered in day-to-day practice.

CLINICAL MATERIAL FOR THIS STUDY

Of the 449 cases, all but three were proved by histological examination. In the three exceptions, operation was limited to drainage of abscesses without removal of the ruptured appendix.

In 129 cases, or 26.9 per cent of the series, the appendix was ruptured at the time of operation. Thirty patients died, a mortality rate for the series of 6.7 per cent. Twenty-six of the thirty deaths occurred among the 129 patients with ruptured appendices, a mortality rate for this group of 20.2 per cent. Among 320 unruptured cases there were four deaths, a mortality rate of 1.25 per cent. Actually, only one of these four deaths, a case of pulmonary embolism occurring in a thirty-eight-year-old male, can fairly be attributed to the operation. The remaining three deaths were due to the following causes: Myocardial failure in a man, seventy-nine; cerebral hemorrhage in a woman, sixty-seven years old; and suicide on the tenth day of an uncomplicated postoperative course by a forty-six-year-old male. Nevertheless, taking the uncorrected figures as they stand, the contrast is impressive enough.

Obviously the referring physicians were not responsible for all delayed and ruptured cases. Too familiar is the patient who has been ill three, four, or more days before he calls his family doctor. Equally familiar is the patient, or family, who refuses surgery, or delays accepting it until many days have passed. Furthermore, there are cases in which the morbid process is so fulminating that the appendix ruptures before the promptest of diagnoses and intervention can take place.

* Read before the General Surgery Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9–12, 1938.

TABLE 1.—*Showing the Number of Patients Complaining of the Classical Symptoms of Acute Appendicitis*

Symptom	Number of Patients Presenting Symptom	Percentage of Total Number of Patients
Nausea	305	64.5
Vomiting	211	48.1
Epigastric discomfort	138	31.4
Generalized abdominal pain	250	56.9
Localized pain	408	92.9
Not stated	10	

RESPONSIBILITY OF THE PHYSICIAN

But after all cases of patient error have been eliminated, there remain such a large number of instances of delay or failure in diagnosis on the part of the physician as to constitute a serious challenge to every thoughtful medical man. As Monte Reid points out in a recent editorial published after this paper was prepared[2], responsibility must rest squarely on the shoulders of every medical man who temporizes with this disease, in view of the known striking difference in the mortality and morbidity of delayed, as contrasted with early operation. We say medical man advisedly, because, although surgeons are not free of error, it is usually the family doctor or internist who first sees the patient. Upon him, therefore, rests the primary responsibility of making the diagnosis, or at least of suspecting it, and obtaining adequate surgical advice.

SO-CALLED CLASSICAL SYMPTOMS

Every physician is familiar with the diagnostic constellation of generalized abdominal pain shifting to the right lower quadrant, with nausea, vomiting, point tenderness, muscle rigidity, moderate elevation of pulse rate and temperature, and increased leukocyte count, chiefly in the polymorphonuclear neutrophiles. However, the record seems to show that many are not familiar with the fact that, as Finney[3] puts it, "all of these things are present in a few cases, a few of them are present in the majority of cases, and virtually none of them are present in quite an appreciable number of cases." (Table 1.)

Table 1 shows that no single one of the so-called "classical" symptoms was present in every case. The most constant finding was localized pain, present in 92 per cent. Finney also found this to be one of the most consistently reliable symptoms. Tables 2 and 3 show the errors into which dependence on any single sign, such as fever or elevated blood count, will lead the diagnostician. Our records lead us to agree with other writers that a relative increase in polymorphonuclear neutrophiles is a more constant finding than is elevation of the total white count. Physical examination proved somewhat more reliable than either history or laboratory examination, 399, or 88.9 per cent of the cases exhibiting signs which were interpreted as positive for acute appendicitis. (Tables 2 and 3.)

TABLE 2.—*Showing the Temperature Found at the First Examination of the Patients*

Temperature in Degrees Fahrenheit	Number of Patients
Below 99.0	126
99.0 to 99.9	148
100.0 to 100.9	70
101.0 to 101.9	63
102.0 to 102.9	29
103.0 to 103.9	11
Above 104.0	2

TABLE 3.—*The Total White Blood Cell Count at First Examination of the Patients with Acute Appendicitis*

Total Leukocyte Count	Number of Patients
Below 11,000	125
11,001 to 15,000	111
15,001 to 18,000	70
Above 18,000	143

VARIATIONS IN THE COURSE

The need for alertness and freedom from preconceived ideas regarding the alleged typical onset of appendicitis is strikingly illustrated by Table 4, which lists the presenting symptom in some of the cases which had ruptured before surgery. In each of these cases, emphasis on the presenting symptom led to delay in making the correct diagnosis. The clinician should also bear in mind the cases reported by Mastin[4] in which pain was referred to the shoulder and clavicle. We did not happen to encounter this symptom in our series. (Table 4.)

TABLE 4.—*Unusual Presenting Symptoms Encountered in Our Series of Cases. In Each of These Cases, Emphasis on the Presenting Symptom Had Led to Delay in Making the Correct Diagnosis of Acute Appendicitis.*

Presenting Symptom	Number of Patients
Chill	2
Convulsion	2
Pain in right flank	11
Pain in right lumbar region	3
Pain in left upper quadrant	1
Pain simulating ureteral colic	1
Pain in testicle	1
Dysuria	6
Urinary frequency	3
Pain along outer surface of thigh	1
"Gas" and belching	4
Severe diarrhea	5
Obstinate constipation	2
Anorexia	1

TABLE 5.—*Location of the Appendix in the Patients of This Series. It Should Be Observed that by No Means All the Appendices Listed in the Right Iliac Fossa Were Found Even Approximately Under the Point Described by McBurney. The Three Listed as of Unknown Location Occurred in Patients in Whom Operation Was Limited to Drainage of Appendiceal Abscesses.*

Location of the Appendix	Number of Patients
Right iliac fossa	300
Retrocecal	119
Pelvic	22
Right upper quadrant of abdomen	1
Left upper quadrant of abdomen	1
Sac of right inguinal hernia	3
Unknown	3

A fertile source of error is the complaint of pain and the finding of tenderness at points other than in the right lower quadrant. Pain and point tenderness may occur over the inflamed appendix, wherever it lies—and the appendix may be found in many places within the abdomen other than directly under the point described by McBurney, and even outside of the abdomen, in hernial sacs. In one of our cases, the pain and point tenderness were in the upper left quadrant, and so was the gangrenous appendix. In three others, acutely-inflamed appendices were found in the sacs of right inguinal hernias, two in infants and one in an elderly woman. We have discussed the problem of hernial appendicitis elsewhere[5]. It is enough to say here that this diagnosis must be thought of in every case of supposedly strangulated hernia, especially if the symptoms are in any respect atypical. (Table 5.)

The retrocecal and the pelvic appendix are other traps for the unwary. The former may initiate symptoms likely to be confused with disease of the kidney, ureter, gall bladder, or thoracic organs. Soreness in the right flank, or even the right costovertebral angle, is the only sign in not a few cases where the eppendix lies behind the cecum. At times, especially in the obese subject, there will be an almost total absence of physical findings. In such cases one should be on the lookout for an inflamed appendix nestling under the protection of a thick, fatty omentum, either behind or at the side of the cecum. The inflamed pelvic appendix may be overlooked entirely, or it may be confused with disease of the ureter, bladder or genital organs. In many of these cases, diarrhea and rectal tenesmus will be the only complaints. It is shocking to note, when studying a group of histories, how frequently rectal examination is omitted. This simple procedure frequently elicits the only objective sign of an inflamed pelvic appendix. Rectal examination should never be omitted in any patient with an abdominal complaint, or indeed in *any* physical examination. In this connection a study of Brunn's[6] paper is recommended. (Table 6.)

TABLE 6.—*Distribution of the Patients with Acute Appendicitis According to Age and Sex*

	Age in Years									
Sex	0-9	10-19	20-29	30-39	40-49	50-59	60-69	70-79	80-89	Unknown
Male	20	51	45	17	24	19	12	8	0	6
Female	18	70	72	22	22	12	10	10	1	0
Total	38	121	117	49	46	31	22	18	1	6

INCIDENCE ACCORDING TO SEX

Although acute appendicitis is said to occur more frequently in males, our series agrees with that of Sengstacken[7] in showing a slight majority of females. . There were 237 females and 212 males. Despite the fact that disease of the female pelvic organs offers greater opportunity for confusion in diagnosis, a larger number of the ruptured cases occurred in males, the proportion being 31.6 and 24.9 per cent respectively for males and females. (Table 7.)

AGE INCIDENCE

While it is true that acute appendicitis occurs most frequently in persons between the ages of ten and thirty years, no period of life is exempt. There were eleven females and eight males past seventy years of age in this series. All the females and five of the males had ruptured appendices. It is admittedly more difficult to make the diagnosis in the elderly. Often the onset is subacute. Pain, nausea

TABLE 7.—*Distribution of the Patients with Ruptured Appendices According to Age and Sex*

	Age in Years									
Sex	0-9	10-19	20-29	30-39	40-49	50-59	60-69	70-79	80-89	Unknown
Male	7	15	11	7	8	12	4	5	0	1
Female	11	10	6	7	5	5	4	10	1	0
Total	18	25	17	14	13	17	8	15	1	1

and vomiting, and rigidity are frequently absent. In many cases there are only generalized abdominal soreness and increasing constipation. Elderly patients frequently do not show the typical leukocytic response to infection, or any marked rise in temperature. Too frequently, signs of general peritonitis or a localized abscess give the first clue to the nature of the illness. Lazarus[8] is one of the recent writers to discuss this problem.

The young child also may tax the skill of the most capable diagnostician. Maes and coworkers[9] found that only 27 per cent of 250 children with appendicitis entered the hospital with their disease in the simple acute or acute suppurative stages. In our series there were thirty-eight children under ten, twenty boys and eighteen girls. In seven of the boys and eleven of the girls rupture had occurred. Two of our children had convulsions at the onset. In two others a violent chill was the initial symptom. Anorexia, colicky pains occurring intermittently and not localizing until very late, diarrhea, and general irritability, were other ways in which the infection was first manifested. We twice encountered temperatures above 104 degrees Fahrenheit. Leukocyte counts above 20,000 were not uncommon. Nixon and Nixon[10] and McClure[11] discuss the diagnosis of juvenile appendicitis and its special problems.

OTHER FACTORS

McKenna[12] emphasizes the importance of obtaining a sequential history in all cases of intra-abdominal disease. He also calls attention to Wilkie's belief that obstructive appendicitis is usually initiated by violent cramps, followed by nausea, vomiting, and repeated colicky attacks, whereas the acute inflammatory type most frequently has its onset with symptoms of malaise and without sharp pain. Such differentiation, however, is largely academic. Even if one could always be sure that the patient's symptoms were due to obstruction by a fecalith rather than to actual inflammation, it should be realized that the former is potentially just as dangerous. Indeed, perhaps a majority of ruptured appendices will show either a fecalith present, or signs of necrosis due to pressure by such a foreign body.

Although our records, especially in the earlier cases, do not contain notations regarding the presence or absence of skin tenderness in a sufficient number of cases to make it worth while to include this datum in the tables, we believe it to be a helpful finding in a certain percentage of cases. We agree with Livingston[13] that skin tenderness in the right lower quadrant will more frequently be elicited by vigorous stimulation than by the light stimulation used by Cope[14] and others.

AUTHORS' STATISTICS

It is no particular credit to us to have made a correct preoperative diagnosis in four hundred, or 89.1 per cent of the cases reported, and to have suspected the diagnosis strongly enough to operate for appendicitis in another thirty-three or 7.3 per cent, in view of the fact that so many of the patients were seen in consultation in advanced stages of the disease. The remaining 3.6 per cent, in which operation was performed under other diagnoses are instructive, however. In addition to the three cases thought to have strangulated hernias, another three patients were believed to have acute cholecystitis, two were thought to have salpingitis, two tuberculous abscesses, and two intestinal obstruction. One was diagnosed as having ruptured peptic ulcer, one a large ovarian cyst, one a tubal pregnancy, and one was at first believed to have colitis. In short, appendicitis may at times be confused with practically every acute disease within the abdomen.

IN CONCLUSION

In this connection we wish strongly to defend the diagnosis of "acute surgical abdomen," and the logically following exploratory operation. Skillful as the diagnostician may be, he will inevitably find an occasional case in which a specific diagnosis is not possible. It is rare, however, that he cannot in good conscience say that *something* is wrong in the belly. Too much time should not be lost in study or in waiting for definite localizing symptoms. Fewer deaths will result from occasional unnecessary laparotomies than from over-cautious delays which allow acutely inflamed appendices to rupture.

SUMMARY

1. A series of 449 consecutive cases of acute appendicitis is analyzed with respect to diagnostic problems.

2. The disease occurred in this series more frequently in females than in males. Although most common in the second and third decades, it was encountered in all age groups up to and including the ninth decade.

3. The percentage of cases ruptured when first seen by the surgeon was highest in the very young and very old, indicating the necessity for unusual care in studying abdominal complaints in these age groups.

4. No one symptom or sign occurred in every case.

5. Comparatively few patients showed the usual history of onset and physical findings described in the textbooks. Many exhibited some of the classical symptoms and signs. A surprisingly large number showed almost none of them.

6. Unusual symptoms of onset seen in this series included: chills, convulsions, dysuria, frequency of urination, pain resembling ureteral colic, pain in testicle, pain along outer surface of thigh, diarrhea and "gas."

7. The physician must not allow himself to be misled by atypical location of point tenderness and rigidity, or by their absence. These signs occur when peritoneum is irritated by an inflamed appendix, wherever it may lie—and the appendix may lie anywhere in the abdomen or even out of it, in a hernial sac.

8. Absence of point tenderness or rigidity should call to mind the possibility of a retrocecal or pelvic appendicitis.

DISCUSSION

E. H. Eiskamp, M. D. (408 Main Street, Watsonville).—It has been a pleasure to discuss the paper of Doctors Burger and Torbert. It shows well-kept case histories and careful analysis of their findings, which are of great value to all of us. It is impossible to add anything to such a paper; however, there are certain things which I should like to emphasize.

I feel that in every patient with abdominal cramps without diarrhea the appendix must be eliminated, as it is the most common lesion of the intestinal tract. As one speaker stated, there is no one symptom or series of signs and symptoms necessary for the diagnosis of appendicitis, but we have felt the most important diagnostic point was midline abdominal cramps, followed by localized tenderness in the abdomen. The abdominal cramps may be high or low in the abdomen and may be referred to by the patient as cramps, gas, distress or aching, but he will usually state that moving or pressure does not aggravate them and often helps. After the localized tenderness arrives he may not recall them until he has been carefully questioned. The tenderness or soreness may be anywhere in the abdomen, depending on the location of the appendix. Regardless of the location of the tenderness, if preceded by abdominal cramps, we feel that we are probably dealing with an appendix. I feel that a rectal examination is of great importance, especially in children.

We feel that a pain beginning in the right side is probably not of appendiceal origin, unless a localized abscess of the appendix has ruptured, when careful history will usually tell of a preceding attack. Blood in urine is always a disturbing finding, but we have found it on some occasions. The white blood count is always very helpful if it shows a leukocytosis and an increase of polymorphonuclear, but is often absent, especially in fulminating appendicitis. We have found the Schilling index to be of some help in this type of case.

In the very early cases the appendix will appear normal to macroscopic examination, except for slight catarrhal inflammation of the mucosa at the point where it is kinked or a fecilith lies. If one is careful not to clamp the appendix itself, these early gross changes are not obscured.

⁂

John Homer Woolsey, M. D. (Woodland).—Every statement in this paper is true, and discussion could well consist of the advice—study it, digest it, and do it. Failure to diagnose promptly and correctly is the physician's side of the problem. The opportunity for two or more able physicians to see the patient, as provided at a hospital or in group practice, does much to alleviate this. Consultation early and more often by the single practitioner is advisable. The classical history is not always present before surgical treatment, but after the patient is over the attack and he can think more logically, it is surprising how classical the history often becomes. Not infrequently we hear the opinion given, "He has appendicitis and we are watching him carefully." This is illogical thinking, for none of us can be certain of the stage of inflammation; and if the diagnosis is made, then for the safety of the patient, prompt and proper surgical care should be employed.

Pain is the common symptom and of greatest significance. In the elderly and the very young the nervous system is not as well organized and coördinated and the complaint may be not as classical. In the elderly the circulation is not as adequate and gangrene ensues much earlier. Fever is of no significance in relation to treatment. Never wait for fever before employing the only proper treatment—surgery. Local muscle spasm and tenderness is dependent to the main extent upon irritation of the parietal peritoneum and so an inflamed appendix entirely separated from the parietal peritoneum may have no muscle spasm and but little tenderness. The pelvic appendix is the most difficult type to recognize. As the author advises, read Brunn's excellent article. The white blood count is more misleading to the profession, as a whole, than any other index. Make your diagnosis before this information is at hand, and look upon it as an index as to the degree of protective response on the part of the patient.

Not every abdominal pain means appendicitis; but when the evidence is indicative of continued intra-abdominal inflammation act promptly, for a life is at stake. We do not recommend unnecessary or ill-advised surgery, but when the evidence is adequate prompt surgery is in order, and if necessary the preoperative diagnosis of "acute surgical abdomen" may at times have to be accepted.

⁂

Doctor Burger (Closing)—In closing the discussion, I wish to thank all those who have participated. The contrast in mortality in this small group of cases was so marked that it seemed to us worth while to attempt to point out some of the pitfalls which led referring practitioners into delaying diagnosis until the appendix had ruptured.

May I repeat, a strikingly large number of ruptured appendices in our series occurred in very young and very old patients, and in persons where the organ was either retrocecal or protected by a large, fatty omentum. The physicians in very many of these cases failed to diagnose appendicitis "because there was no rigidity," or "no point tenderness at McBurney's point." Our tables are worth studying, and indicate how few cases showed all the findings of the so-called textbook picture. If the newer generations of doctors are ever to improve their diagnostic percentage in this disease, the picture embalmed in present-day surgical textbooks is going to have to be drastically modified, to conform more closely with the facts of real life.

Dr. Homer Woolsey's auscultation of the abdomen, which he so convincingly presented this afternoon, was not practiced by us in this series of cases, but he may be sure that we shall avail ourselves of this diagnostic aid in studying our next ten-year series of cases.

RADIATION THERAPY IN ACUTE AND CHRONIC INFLAMMATORY CONDITIONS*

By Henry Johnson Ullmann, M.D.
Santa Barbara

Discussion *by Robert S. Stone, M. D., San Francisco; Frederick H. Rodenbaugh, M. D., San Francisco; Orville N. Meland, M. D., Los Angeles.*

THE title of this paper is misleading, as the intention was to cover inflammations due to infections, since these are the conditions usually benefited by properly applied irradiation. Stress will be laid on the commoner forms seen almost daily in practice and in which irradiation produces immediate amelioration of symptoms and frequently a rapid cure. It is interesting to note that the treatment of inflammations and infections was one of the first uses of the roentgen ray in therapy; but although roentgen therapists have been familiar with its value and the literature is replete with reports, it is only within the last few years that its value has become recognized by the general profession.

---

* Read before the Radiology Section of the California Medical Association at sixty-seventh annual session, Pasadena, May 9–12, 1938.

EXCERPTS FROM THE LITERATURE

The following quotations are taken from "A System of Instruction in X-Ray Methods" by S. H. Monell, M. D., 1902. These are given for their historical interest and to show how early the roentgen ray was found of benefit in the conditions under discussion.

"Stembo was led to make use of this method for the relief of neuralgic pains by the fact that sometimes patients report relief from pain when the rays have been employed for merely diagnostic purposes." I remember a patient in 1912 who obtained temporary relief from his sciatica, following the taking of pelvic roentgenograms. We all know the amount of radiation required to get a readable pelvic picture in those days. "Sittings were from three to ten minutes every second day. Relief was generally reported after the third application." "Schiff and Freund reporting four years' experience in August, 1900, consider furunculosis an indication for the use of x-ray." Monell devotes a whole chapter on the use of x-ray in tuberculosis and submits many case reports indicating its value.

"From Germany was reported the cure of a case of 'undoubted tuberculous peritonitis' by the x-rays," details followed.

There is no question that the value of irradiation in the treatment of tuberculosis, and some at least of the pyogenic infections have been known as long as its value in the treatment of acne, leukemia, eczema, psoriasis, and superficial skin malignancies; in short, from the time of its earliest use as a therapeutic agent. In spite of this knowledge, easily available in medical literature, there has been relatively little use of irradiation by the profession at large for these common affections until recent years, and even now its value is little appreciated away from medical centers.

DISEASES IN WHICH RADIATION IS OF PROVEN VALUE

Radiation is of proven value and in some cases the therapeutic agent of choice in:

Tuberculous adenitis, peritonitis, osteitis and arthritis, cystitis and seminal vesiculitis, and tuberculosis of the intestines and pelvis.

Mikulicz's Disease.—The roentgen ray has been used successfully in this condition for many years.

Chronic pharyngitis, especially with hyperplasia of lymphoid tissue following tonsil and adenoid operations in children, but is not sufficient to warrant another operation, and in the "smokers' or speakers' sore throat." The relief is distinct and definite.

Acute and subacute infections of the throat, especially the subacute with involvement of the regional lymph glands. Although the results are not uniform, they are enough to justify treatment in every such case.

Actinomycosis.—The reports are somewhat conflicting, but apparently the poor results were due to inadequate dosage. The dosage required for actinomycosis is apparently many times the optimum for the pyogenic infections and tuberculosis.

Furuncles.—It is well known to those who have treated a large number that, with few exceptions, a furuncle can be aborted in its early stages, especially before pus has appeared, by a single exposure to the roentgen ray. In the later stages, marked benefit is usually seen, but the results are not nearly so uniform or spectacular.

Pyodermias.—Usually streptococcic, about the nose and upper lip and all of great potential danger. I have treated a small but increasing number in the past few years with uniform and prompt healing as a result.

Carbuncles.—While not entirely uniform the results are usually spectacular. This effect is most noticeable in the slow indolent types, with little systemic reaction and marked toxemia. I consider irradiation of the spleen, in addition to the carbuncle, of considerable importance. This is partly on theoretical grounds, but I am under the impression that my results have been more prompt when this was done.

Benign Adenopathies of the Mediastinum and Lung Roots and Unresolved Pneumonias. — In these the effect is uniformly beneficial if the irradiation is properly carried out. In fact, there is no other treatment that offers so much. It is not possible to lay down any regular course or number of treatments. Each patient must be highly individualized and treatment carried out in close coöperation with the internist or pediatrician.

Chronic Sinusitis.—There are many favorable reports in the literature, but the author's experience has been limited.

Mild Chronic Inflammatory Processes Involving Limited Areas of the Lungs.—I admit this is a very loose description, but I refer to a condition in which the patient is more or less toxic, may or may not run a slight temperature at times, and in whom the internist can hear, at least occasionally, a few moist râles over a limited area. Sometimes the patient will have more or less discomfort referable to the same region. All search for a tuberculosis has rendered negative results. In the few such patients that I have irradiated over the affected lung area, the results have been very gratifying. The patients have uniformly felt and looked better, toxicity and temperature have disappeared, and weight gained. The effects have not been immediate. It has usually required two or three treatments a week for several weeks before really marked results were seen, although frequently the patients will say they feel better after the second or third dose.

Acute and Chronic Parotitis.—My experience has been limited, but results have been encouraging in the few treated.

Acute and Subacute Infections About the Jaws and Neck.—In these the effect of the irradiation is spectacular, as shown in the following typical cases, both referred to me by Dr. Barkley S. Wyckoff:

REPORT OF CASES

CASE 1.—A white male, age 37, entered the hospital February 24, 1938, with a history of fractured mandible for at least two weeks. This fracture proved to be a compound lesion into the mouth in the angle of the left mandible. Fracture was reduced and external drainage was instigated the same day.

One week later another drainage tube was placed below the original incision and into the fascia of the neck. Sulfanilamid therapy was given for a period of forty-eight hours with no apparent benefit. The temperature remained around 102 degrees during this time, with very little drainage from either incision. On March 1, roentgen therapy was started, the temperature on that day being 101.6 degrees. These temperatures are rectal readings.

The following day the temperature rose to 102.4 degrees. On March 6, the high temperature for the day was 99.4 degrees. Radiation was given on that day. The temperature dropped to normal in the morning of March 7, with slight variations during the day and a normal temperature reading in the morning. Another treatment was given on March 10. Copious drainage was noted on the dressing at this time. The temperature remained normal in the morning, rising somewhat in the afternoon. On March 22, considerable swelling appeared. The temperature rose to 101.4 degrees. On March 23, radiation was again given. The temperature on March 24, in the morning, was normal. Radiation was repeated on March 25 and 28, and April 7. Frequent x-ray films were taken during the process of treatment, and at one time a slight rarefaction was noticed about the edges of the wound, suggestive of osteomyelitis. Subsequent x-ray findings showed considerable recalcification about the fracture line.

It was noted with great interest that, following radiation therapy, the drainage was greatly increased. The patient was dismissed on April 28 with no edema and no drainage from either incision, and was able to masticate food, the teeth being in excellent occlusion.

* * *

CASE 2.—A white female, age 26, entered the hospital on June 30, 1936, with edema of the entire right side of the face, extending down into the neck. This was a cellulitis due to an unerupted lower right third molar. The temperature on being admitted was 100.4 degrees. A marked trismus was present and the patient was obviously in great pain.

The following morning incision and drainage were instigated from the cheek into the mouth. No pus was demonstrated upon drainage. Later, the same day, radiation was given. The following morning the temperature was 101 degrees, and in the late afternoon the temperature was 102.8 degrees. On July 3, another radiation treatment was given, the high temperature for that day being 102 degrees. On July 4, the temperature dropped from 102 degrees at eight o'clock in the morning to 99.8 degrees in the late afternoon. The drainage on the dressing, in the morning of July 5, was copious, the temperature being down to normal. A slight fluctuation in temperature occurred for several days, and the patient was discharged practically temperature-free on July 7.

I have been fortunate in obtaining similar results in several others. A Ludwig's angina was treated without benefit. A rich drainage of foul-smelling B. coli pus occurred for a day or two before death.

Gas Bacillus Infections.—Excellent results are reported, but I have had no personal experience.

Herpes Simplex.—The use of 150 to 160 r of unfiltered radiation, measured in air, to the lesion almost invariably stops its further development. It is, therefore, important to radiate the lesion as soon after the first symptoms as possible. In some cases the effect is better if the Gasserian ganglion on the involved side is given 75 to 100 r of filtered radiation at the same sitting.

Herpes Zoster.—Irradiation of the involved nerve roots in the acute cases will shorten the course of the disease from 50 to 75 per cent. Local radiation of the herpetic lesions adds to the effect. The most startling and spectacular effects are seen in the postherpal neuralgias. Sometimes the pain is relieved by the first irradiation, at others the pain is aggravated for a short time before the relief is felt. This increase of pain, I believe, indicates a larger dose than is needed for that particular patient. I have found that two to four irradiations given twice a week are usually all that are necessary, although a few patients required a longer series before complete disappearance of the neuralgia occurred.

COMMENT

There are other similar or related conditions in which irradiation has been found of value, but the limited scope of a section paper prevents their inclusion, and it is hoped that the discussion will broaden the field already covered.

As many of these patients must be individualized in planning treatment, it is of prime importance always to keep the following effects of radiation in mind, especially when deciding on the size of the dose and the timing of the treatment or treatments. Bacteriolysins in the blood are increased. Treatment before antigens are formed or injected reduces or prevents the formation of antibodies, but with normal doses does not affect already formed antibodies and at the same time inhibits the removal of antigens from the blood. This inhibition is supposed to occur through an inhibitory effect on the reticulo-endothelial system. Radiation interferes with the production of anaphylactic bodies and the elimination of antigens present. It restrains the formation of specific bacterial agglutinins and lysins. Irradiation of the spleen with 150 r or less increases immunity reactions. Irradiation with 300 r produces no effect, *i. e.,* on immunity reactions. In the few patients whom I have observed, I believe that I obtained a more prompt and pronounced effect when I irradiated the splenic area with 100 r total or skin dose, simultaneously with the irradiation of the affected region in acute pyogenic infections.

1520 Chapala Street.

DISCUSSION

ROBERT S. STONE, M.D. (University of California Hospital, San Francisco).—Doctor Ullmann has given us again a discussion of a timely subject. Radiation therapy of inflammatory conditions is well known to radiologists, but its value is appreciated too little by the general practitioners and surgeons who first see the patients. The subject has been broadly covered by the essayists, but there are two conditions that should be somewhat more emphasized.

Pneumonias, both lobar and broncho types, have been the subject of intensive study in recent years, with special attention to treatment with serums. In the enthusiasm for serum treatment the work of Dr. Eugene Powell of Temple, Texas, has passed comparatively unnoticed. He reported better results in Type I infections than have been obtained with serum. The patients reported subjective improvement in two or three hours. Powell's results challenge us to give such effective treatment to our patients or to prove that he was wrong in his interpretation of his results. He used doses of 250 to 300 roentgens over the involved areas.

Infections with the gas bacillus are not common, and most of us are seldom called upon to treat many cases. The collective experience of those who have used x-ray therapy as soon as such an infection was discovered forces us to the conclusion that the first therapeutic agent to be thought of should be x-rays. When an agent acts so promptly and efficiently, we should not withhold it merely because we do not understand how it works.

In the case of furuncles and carbuncles, I should like to emphasize that x-rays should be thought of, not as a last resort, but as the treatment of choice to be instituted as early as possible. Unfortunately, because of the years of training that the laity have had in not being treated till a "core" or "pus" has been found, patients seldom present themselves early in the course of the disease.

⁂

Frederick H. Rodenbaugh, M. D. (490 Post Street, San Francisco).—Doctor Ullmann again reminds us that in recent years the radiologists have devoted the major portion of their time to the therapy of malignant disease and have not fully explored the use of radiation in nonmalignant disease.

The knowledge that the metabolism and function of the connective tissues and parenchymal cells are extraordinarily increased by inflammatory processes explains why physically equal doses of radiation have a more marked effect on inflammatory cells than on normal cells, provides a rational basis for all radiation therapy.

This effect is both local and systemic, and the type of therapy is, therefore, dependent on the lesion; and justify an increasing use of radiation therapy on the so-called inflammatory lesions. We should be guided in our selection of such cases by our clinical judgment, until more precise measurements are available.

Doctor Ullmann's reports are most interesting and instructive, and we should be grateful to him for calling to our attention this frequently neglected group as radiation problems.

⁂

Orville N. Meland, M. D. (1407 South Hope Street, Los Angeles).—While radiation therapy has been used most extensively in malignant disease, its greatest use probably lies in the various inflammatory conditions, a few of which Doctor Ullmann has mentioned. Years ago radiation was used empirically, but now it is believed that its value is due to its effect on the lymphocyte, one of the most radio-sensitive of all cells. Therefore, it is easily seen that the dosage for a favorable result is very small in comparison to the one used in malignant diseases.

One wonders why radiation is used in such a variety of disorders; the answer is rather simple. All metabolic changes in the body are due to disassociation of chemical substances into positive and negative ions, and their free interchange through cell membranes. The effect of radiation in the tissues is due to the ionization it sets up in the areas treated, thus speeding up chemical changes which may be so violent that the cell dies, liberating immune bodies.

The use of radiation for the various inflammations does not mean that we should discard the old and tried methods, such as hot compresses, surgery, and specific drugs, but the profession should know that it represents another supplementary aid. This is particularly true in such entities as gas infections, unresolved pneumonias, and actinomycosis.

PRURITUS ANI*

By Charles R. Caskey, M.D.
Los Angeles

In the majority of cases of pruritus ani, the cause of the itching is, in my opinion, associated with some local pathology. I cannot subscribe to the theory of some clinicians that this ailment is a definite disease entity. All cases should not be treated alike by injections or by vaccines, as has been advocated by some, for 100 per cent results cannot be secured by any one method of treatment. Success must depend upon our ability to make a correct etiological diagnosis and properly apply the appropriate treatment. Of this greater percentage of cases due to local conditions, some arise from causes of a dermatological nature. It is this group that I wish to discuss in this short essay.

CAUSES OF PRURITUS ANI

In order to visualize and segregate dermatological causes of pruritus ani, I have compiled a complete list of causes ascribed to this distressing symptom.

Anorectal conditions	Hemorrhoids	Infection of anal ducts
	Fissures	Chronic proctitis
	Fistulae	Parasites
	Polypi	
Genito-urinary diseases	Nephritis	Endometritis
	Cystitis	Prostitis
	Cervicitis	Posterior urethritis
	Vaginitis	Vesiculitis
Systemic conditions	Diabetes	Cholecystitis
	Renal disease	Hepatic cirrhosis
	Constipation	Allergy
	Menopause	Alcoholism
	Senility	Use of tobacco
	Diatetic errors	Psychoneurosis
Skin diseases	Lichen planus	Bacterial infections
	Psoriasis	Fungus infections
	Circumscribed neurodermatitis	
Idiopathic pruritus ani		

ANALYTICAL CRITERIA

I shall now briefly outline the criteria by which to segregate those cases in the field of a dermatologist. This can be done to a certain extent by a process of elimination, and by evaluation of direct and indirect symptoms of a particular case after a careful history and examination. Proctological, urological, gynecological, or internal factors should be considered in a complete examination and careful consideration of their value noted. In many cases it is an advantage to have the opinion of one or more of the specialists in the fields just mentioned. It is especially important to know whether or not there is rectal pathology present. This should be ascertained before beginning treatment, even though there is evidence of skin involvement. A more or less severe dermatitis may be present, but due wholly to trauma, secondary infection or to irritating treatment. A careful history and examination will help us to evaluate these factors. Our examination should include not only the anal area of the skin, but also other parts of the integument for signs of lichen planus, psoriasis, neurodermatitis, or other conditions.

Lichen Planus.—Lichen planus, occurring in the anal area, is distinguished by violaceous patches made up of smaller individual polyangular flat-topped lesions. Unless severely excoriated and irritated by strong applications, the condition is not exudative. It is not likely to occur about the anus without showing typical patches elsewhere on the skin or mucous membranes. The treatment is that usually given lichen planus, namely, arsenic by mouth or parenterally, and roentgen therapy locally.

Psoriasis.—Psoriasis does not often occur in the anal area. When it does, it is likely to show as a white sodden area extending up from the anal area to the upper part of the intergluteal region. Not infrequently the condition takes on a "beefy" appearance. It seldom occurs in this region without at the same time appearing in well-defined patches in other intertrigenous areas, and is rarely pruritic. The most effective treatment is x-ray.

---

* Read before the Dermatology and Syphilology Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9–12, 1938.

Circumscribed Neurodermatitis.—Circumscribed neurodermatitis may appear in the anal region. If it does, it shows as a localized, lichenfied, infiltrated patch of a dry rather than moist character. The patch does not usually invade the anus, but lies without the folds of the anal circle. For this condition x-ray is again the local remedy of choice.

Bacterial Infections.—Bacterial infections may attack the anal and perianal area. Pyogenic infection is recognized by a purulent discharge. Streptococcic infection in this location is rarely the cause of troublesome pruritus. These conditions can be treated with antiseptic solutions chosen to combat the particular organism proved to be the etiological agent.

Fungus Infections.—It is my opinion that, of the dermatological causes of pruritus ani, most of them are due to fungus infections. This opinion in most instances is based on clinical findings. Since the anal area is so subject to contamination that examination of the scrapings or of cultures are likely to give us false impressions, it seems hardly worth while to carry out routinely these diagnostic procedures. This is unfortunate in some respects, but in most cases treatment has to be carried out symptomatically. If there is a severe dermatitis, this must be dealt with by appropriate, soothing remedies before one can use medication directed against a specific organism. For clinical confirmation of a diagnosis of mycotic pruritus ani one should look for a sodden, epidermal circle of varying radius extending outward from the anus. This sodden epidermis not infrequently extends upward between the gluteal folds. One should search also for evidence of tinea cruris, which may be present in the groin as small or large, well-defined red scaling areas. The finding of sodden interdigital epidermis is confirmatory evidence of a mycotic etiology. It shows that the patient is susceptible to fungus infections, and that he has a focus on the body and may have transferred the disease to another location. I regard, also, patches of eczema on hands or other parts of the body as highly significant, and on these findings I classify the case as one due to fungus infection. To substantiate my impression that some of my cases are due to fungi, I have observed several cases of pruritus ani which developed typical phytid vesicles in the palms, and many cases have had lesions of fungi elsewhere on the body.

PATHOLOGY

The study of the pathology of pruritus ani has not been of much assistance in arriving at an etiological diagnosis in this disease. The histopathology is that of an acute or chronic process, with only the cellular changes found in any acute or chronic skin disease.

TREATMENT

The treatment of pruritus ani must, in many instances and particularly in a new case, be directed to giving symptomatic relief. If the skin is very raw and excoriated it is advisable to discontinue all previous medication, even so-called anesthetic ointments. A severe dermatitis is not infrequently dermatitis medicamentosa. To a dermatitis medicamentosa is often added another insult—actinic dermatitis. After using ultra-violet light for many years, I feel that it has no place in the treatment of pruritus ani. It is contra-indicated in all acutely inflamed dermatoses.

In medicine it is just as important to know what should not be done as it is to know what should be done. Hence, if the case is acutely inflamed I rely on a soothing application, and my choice is the well-known Burow's solution diluted with cold water. It is doubtful if aluminum acetate ever produces irritation. A second choice as an astringent and antipruritic is potassium permanganate in 1-3000 dilution. It may be used stronger or weaker, according to indications. Strong remedies should be used with caution for a few days. At this acute stage treatment should be directed toward calming the extremely nervous patient. Morphin or barbiturates I regard as contra-indicated. I feel that I have had some sedation from moderate doses of bromids. In one case hypodermic injections of codein proved very satisfactory in tiding a nervous, exhausted patient over the crisis. This particular patient could only tolerate Burow's solution locally, and after several weeks of its persistent use was rewarded by complete relief. His case began as pruritus ani, but extended to groins, genitals, and finally by sensitization to feet, hands, and face.

During the acute stage, treatment with x-ray must be used with caution lest we make our patient more uncomfortable. My preference is to withhold its use until an acutely irritated skin has been brought under control by the soothing applications first mentioned. To accomplish this it may be necessary to hospitalize the patient where medication, diet and hygiene can be controlled, for these cases sometimes drift into a state in which they will not control themselves. Patients should not be labeled neurotic or psychotic just because they are beside themselves from intolerable itching and loss of sleep. When acute inflammation has somewhat subsided, one may cautiously begin the use of mild, soothing ointments.

As a local anesthetic and antipruritic, phenol one per cent in petrolatum may be sufficient. In some cases I have found the addition of menthol one-half per cent to this ointment soothing. Equal parts of chloral hydrate, menthol and camphor, rubbed down to a fluid, may be applied in small amounts for the relief of itching.

The physician should emphasize to the patient that instant and complete relief is not to be expected except from injection of local anesthetics. Even these have their hazards and disappointments. Remedies should not be too strong or complex, lest one irritate with chemicals an alreadly hypersensitive tissue.

At this point the cautious use of x-ray is beneficial in both mycotic and nonmycotic types of pruritus ani. It has unquestionable antipruritic effect, and at the same time checks the secretions in an area predisposed to the growth of organisms which thrive in warmth and moisture. The dosage and frequency of its application must be left to the judgment of one familiar with its use and its joint effect with the other remedies used. Here discretion is the better part of therapy. If by this time one has reached conclusions as to etiology, therapy should be directed toward removing the cause of the pruritus.

If the case is one of mycotic nature, I usually prescribe an ointment consisting of 1 to 3 per cent salicylic acid and 2 to 5 per cent sulphur, or iodin, oil of cinnamon, and thymol, each one-half per cent in petrolatum. Caution has to be exercised as to strength permissible, depending upon rawness of anal epidermis. The effect may be materially enhanced if the patient is required to wear a soft cloth pad to hold the ointment in apposition to the tissues. The dressing prevents also soiling of the clothes and lessens the temptation to scratch.

Fissures and raw excoriated points can be made much less painful if painted every two or three days with 5 per cent silver nitrate solution. If the skin is not too irritated I paint the area with a solution composed of phenol 0.3, tincture of iodin 5, camphor water q. s. ad. 30. Before applying this the ointment should be removed with a mild soap and soft washcloth and the skin dried. After the paint dries, while the buttocks are held apart, borated talcum powder should be dusted on the area. This is preferable for day treatment, as it is dry and does not soil the clothes. Ointments are better for night treatment. The paint may sting quite sharply when applied, but that passes off in a few minutes. It may be applied twice a day and the ointment discontinued if the patient gets more relief from it. In some cases a medicated paste may give most relief, such as 1-2-3 paste. Always watch for possible irritation from your medication. One must distinguish between irritation and the spread of the disease. Remember, nature does the healing and do not get in her way.

General hygienic measures should be instituted at the patient's first visit and should be directed to general health, sleep, rest, nutrition, bowel function, and local cleanliness. The anal area should be cleansed with a mild soap and water after each bowel movement. Remember, pruritus ani more frequently occurs in the nervous, overworked, anemic individual. Investigate all body functions and correct as indicated. It may be advisable to proscribe liquor, coffee, and tobacco.

SUMMARY

1. The numerous possible causes of pruritus ani have been enumerated and it has been emphasized it is the opinion of the writer that most cases are due to some dermatological condition, and that a large percentage of these are caused by fungus infections.

2. A method of treatment is outlined with emphasis toward giving symptomatic relief, while at the same time attacking the causative factor. The importance of nonirritating and soothing remedies in acute cases is stressed. Overmedication or too frequent use of physical agents are dangers to be avoided. The proper use of roentgen ray in the treatment of pruritus ani is of great therapeutic value.

3. Local and general hygienic measures are mentioned last, but it is important that they receive due attention.

1930 Wilshire Boulevard.

RENAL FUNCTION IN THE AGED*

By L. Dale Huffman, M.D.
Hollywood

THE development of tests of renal function, based on the conception of glomerular filtration and tubular resorption, has provided the clinician with quantitative methods for the measurement of the phases of the secretion of the urine. These methods are being successfully applied in evaluating renal function. I wish to report the findings resulting from the application of some of these tests in the physical examination of the very old.

PATIENT GROUPS UNDER OBSERVATION

Four groups of persons, seventy years of age and older, were examined; all were ambulatory. In one group were fourteen men and twenty-two women school teachers, all actively engaged in their profession. The nonprotein nitrogen and uric acid of the blood, the urinalyses and blood pressure readings are tabulated (Table 1). In a second group were five school teachers and five well persons more than eighty years of age, who volunteered to have the tests. The phenolsulphonephthalein tests, urea-clearance tests, and Addis's sediment counts are shown (Table 2). In a third group are patients seventy-five years of age or older. Data from the blood pressure readings, the nonprotein nitrogen tests, the phenolsulphonephthalein tests, and the urinalyses are shown with the diagnosis of the major pathologic condition (Table 3). The fourth group were men who complained of dysuria, and in whom blood pressure readings, phenolsulphonephthalein tests, urea-clearance tests, and Addis's sediment counts were done (Table 4). Specimens in this group were obtained by catheterization. The methods utilized in performing the tests are outlined by Belt in Volume II of "Modern Urology" by Cabot.

RESULTS OBSERVED

The blood pressure in the group of school teachers was elevated in four instances, all women. Albuminuria and casts were present in fourteen cases out of thirty-six, and an abnormal number of leukocytes was noted in the urine of four men. The nonprotein nitrogen and uric acid of the blood were not increased above normal. The specific gravity

of the urine did not show significant alteration in any case.

A comparison of tests of renal function in the "normal" old persons is found in Table 2. Values for the two-hour phenolsulphonephthalein test and the urea-clearance test are normal. There were reduced amounts of phenolsulphonephthalein returned in the first fifteen-minute specimens. Large numbers of leukocytes were found in all the sediment counts in this group, and in four of the men extremely large numbers were found. Casts and traces of albumin were frequently present. The specific gravity of the urines was not unusual.

The results of the tests of renal function in fifteen aged patients are shown in Table 3. Cases 3 and 13 were women. The systolic blood pressure was 170 or more in four. The nonprotein nitrogen of the blood was 40 milligrams per 100 cubic centimeters or more in eight instances. The per cent of phenolsulphonephthalein returned in two hours was 45 or lower in five, while the per cent returned in the first fifteen minutes was frequently below 30. The urea-clearance values were below normal in four instances and in the questionable range in four others. The urea-clearance of 206 per cent in the 78-year-old man is of interest. He was markedly aphasic and somewhat deaf. It was not determined if he had had his morning coffee. Albuminuria and casts were frequently present in the urine of these aged patients.

88	M	20	65	70	0	120,000,000	4,000	1.020	tr.

The frequent occurrence of large numbers of leukocytes in the urine of the aged men is noted, while erythrocytes occurred rarely.

Increased blood-pressure readings and reduced phenolsulphonephthalein return in fifteen minutes are noted in each of three of the elderly men who sought relief for difficult and painful urination (Table 4). The return of 60 per cent of phenolsulphonephthalein in one case, in which a urea-clearance value of 36 per cent of normal was found, is unusual. The urine findings suggest renal impairment. The urea clearance values were low in five. Erythrocytes and leukocytes were present in greatly increased numbers in all. Casts were found in five.

COMMENT

Serious degrees of impairment of renal function is not a necessary accompaniment of old age. In these groups of cases true nephritis is rare, and while slight degrees of nitrogen retention are not unusual, the classic picture of uremia is infrequent. The large number of leukocytes so frequently found in the urine of the elderly male is significant. My data indicate the frequent association of kidney impairment and prostatic hypertrophy. Twelve of the fourteen male school teachers had some palpable enlargement of the prostate. The 79-year-old man had had a prostatectomy. The gradations from a symptomless enlargement to complete obstruction may be almost imperceptible. Where evidence of renal impairment exists in the male it is obligatory to rule out obstructive uropathy before a diagnosis of true nephritis is made.

The presence of albumin and casts and fixation of specific gravity of the urine in either sex clearly indicates that other functional tests should be employed before any conclusions are drawn regarding the renal status. There is usually adequate function if the excretion of phenolsulphonephthalein approaches 40 per cent in the first fifteen-minute specimen, and 60 per cent in the two-hour specimen. Likewise, when the value of the urea-clearance test in per cent of normal is 70 or more, good renal function is usually present. When values of urea-clearance are 50 per cent of normal, some impairment is present and values from 50 to 70 per cent should be considered doubtful, and other tests of renal function employed. When clearance studies

show values less than 25 per cent, a dangerously low level has been reached in the aged person. It is implied throughout that the sources of error in technique have been dealt with, particularly inaccuracy in timing specimens and in incomplete emptying of the bladder.

The use of the Addis sediment count is not general. It is time-consuming and requires strict co-operation of the patient. When these conditions are met the author believes the information obtained amply repays the time and effort spent. It may become the most useful single procedure.

The level of the nonprotein nitrogen of the blood may be of significance in showing kidney impairment. Elevated values are regularly found when the urea clearance is 20 per cent of normal, and half the time when the urea clearance is from 20 to 40 per cent of normal.

It is difficult to analyze the factor of blood pressure as related to renal function in the aged. Some elevation of blood pressure normally occurs up to the eighth decade. It is probable that vascular narrowing in the renal bed, incident to advancing years, necessitates a physiological increase in the general blood pressure to facilitate the work of the kidney.

CONCLUSIONS

In the evaluation of renal function no single test is to be preferred above all others. It is frequently necessary to investigate all the possible angles, particularly so where early insufficiency may exist. The urea-clearance test is a valuable index of renal function, and, where exactitude in collecting all the urine voided in a specified time has been done, impairment of renal function is demonstrated before the urea, uric acid or creatinin of the blood is increased. Accuracy in collecting specimens is interfered with where urinary obstruction or incontinence is present. This may be partially overcome by catheterization. The tests of specific gravity indicate the ability of the kidney to concentrate and dilute. It may be disadvantageous in the aged to impose extreme water restriction or to overburden a failing myocardium with excessive amounts of fluid. It is probable that the aged organism requires less fluid for its reduced metabolism than younger age groups.

The limitations of the phenolsulphonephthalein test are the same as those of the urea-clearance test, while

its range is more restricted. Where the urea-clearance test may indicate 20 per cent of normal function or less, the phenolsulphonephthalein return may be zero. The ease with which the phenolsulphonephthalein test can be carried out, however, far outweighs the disadvantages cited. Further, when the intravenous method is used and collections are made at fifteen-minute intervals, the resultant data give significant indications of small changes in renal function.

SUMMARY

The combined use of the phenolsulphonephthalein test and the urea-clearance test, in conjunction with the qualitative tests and microscopic examination of the sediment, and a study of variations in specific gravity, furnishes reliable data by which renal function may be studied in aged patients. Such a study, carried out in sixty-seven aged patients, reveals the fact that serious degrees of impairment of renal function is not a necessary accompaniment of old age.

Therefore, if positive findings of diminished function in an elderly individual are discovered, one must predicate the existence of a disease process in the elderly just as in other age groups.

MEDICAL-ECONOMIC PROBLEMS*

By Harry W. Sawyer, M.D.
Fallon, Nevada

With the ever changing political situation this is quite an appropriate time to call your attention to conditions with which we are all familiar, but unfortunately feel that we should "let George do it." I think the time has arrived when every medical association and every member of every medical association should realize the fact that if the standards and the ethics of the profession are to be maintained in the slightest degree, that the responsibility for that maintenance devolves upon the individual members of the medical profession in active participation in the so-called socialized medical programs that have been promulgated at the present time.

The purpose of these remarks today is to stimulate interest in our own welfare. At the present time our activities are outlined and our future is being shaped by the politicians of the country and it is up to us to decide whether or not we are willing to sit back and let that condition continue to exist until such time that any protest that we may see fit to make will be of no avail.

FEDERAL PUBLIC HEALTH PROGRAM

You are all familiar with the $850,000,000 program that is being advocated in Washington and undoubtedly this will come up at the next session of Congress and undoubtedly this will pass under the title of "Social Medicine" which I think is a subterfuge to regiment the physicians of the country. It is a good catch phrase to catch the public mind. It is something we feel is for nothing. Eight hundred fifty million dollars is to be expended upon this program and to date no provision has been made for the dispensing of that enormous amount of money by any medical organization. It is to be in the hands of the laymen. The medical man is to be that of a hired individual who is to be directed in his efforts and to be censured and criticized for the ill results that may result from this procedure, the politicians taking unto themselves any credit that may result from this activity. Eight hundred fifty million dollars is to be expended presumably for public health and to date not one single physician has a word in the set-up as to how this money shall be spent.

MEDICAL CARE OF THE INDIGENT SICK

The medical care of indigents is a community responsibility. It is not the responsibility of the individual physician; it is not the responsibility of any local hospital, but is a community responsibility. The program as outlined and put in effect today depends upon the coöperation of the individual private practitioner throughout the country. These programs are promulgated and developed and individuals come into the field to direct the application of this program. They have approached the local practicing physician and impressed upon him the necessity of his coöperation if this program is to be a success. In the course of the conversation there always develops the cost of this care that he is to give the patient. They start off with a reduction in fees and eventually wind up by giving this service gratuitously. The attitude of the medical profession toward the sick and suffering has always been to relieve that irrespective of any benefit that he personally may derive. When the conditions in the country permitted the physician to select those individuals to whom he might extend his service, that was all well and good, but today everybody that needs medical attention through these various programs that have been developed, is under the impression that he should receive medical attention free of charge. That thought is encouraged and developed by the various programs underway.

The result is that the physician's good nature is imposed upon and in order to give this program a start and by endeavoring to relieve the suffering in his community, he agrees to do this gratuitously. He then is asked to make reports which he does, many times at his inconvenience. These reports are forwarded to headquarters at the end of the year, and the various individuals who have charge of the program make a very elaborate and detailed report, the inference being that this has been the result of their personal efforts, but primarily this report is taken before the legislators and invariably an increase in appropriations is asked as the result of the remarkable showing they have made in the previous year or years, while the truth of the matter is that this showing has been the result of the coöperation of the private practitioner for which he gets no credit. Conditions economically and socially are rapidly undergoing changes in the country. The same thing applies to the practice of medicine and the attitude of the physician toward the public and the individual patients.

---

* President's address, thirty-fifth annual meeting of the Nevada State Medical Association, held at Reno, Nevada, September 23-24, 1938. For minutes, see page 56.

Thomas Parran has made this statement: "It is not unlikely that public health may be the next great social issue in the country." It is the next great social issue and at the present time is being actively developed; I am sorry to say, not for the benefit of the sick and suffering of the country, but in an endeavor to create another political unit that can be driven to the polls on election day and told how they shall vote, being held before them always the dollars and cents of an appropriation and the result that will be given their states because of their voting right and the threat of withholding the appropriation if they don't vote right.

An important conference was held in Washington in July, 1938. A very significant phase of that was the presence of Miss Josephine Roche as the secretary and those of you who attended the last American Medical Association convention at San Francisco recall her nonappearance to address the House of Delegates.

WASHINGTON ACTIVITIES

Now in regard to this health conference and the creation of a Bureau of Health, every organization, every physician in the country should insist that the secretary of that bureau be a physician. Apparently the intent and purpose at this time is not to do that. Again the practice of medicine and the care of public health are to be taken over by the laity, and the physicians of the country are to act in a subordinate position and are not to be consulted as to the program, and are not to have any influence in the direction and spending of this enormous amount of money, but the laity itself with the end result that some "boob's" political position is enhanced.

In regard to this controversy of public health we are not without supporters. The laity fortunately have sensed what is in the air and in certain places and in certain society they are informed. At this time I want to read a little editorial that occurred in a mining journal, the *Mining and Contracting Review* printed in Salt Lake City, now in its fortieth year and this is an expression of opinion by the editor of this paper who cannot be accused of having any particular interest in any financial return that might result from his attitude, so I think this editorial is well worth reading and I am going to take a moment of your time. It is entitled, "The People Know Better."

"We believe the latest Department of Justice inquisition, started by some crackpot will prove to be a complete fizzle. Following New Deal tactics of attempting to create mass hate toward all who accomplish, manage, and provide employment, the Department of Justice is now conducting an assize against the American Medical Association—the leading association of physicians and surgeons.

"The class to which this inquisition is supposed to appeal knows better and all who have real acquaintance with the medical profession know better. Every worker, best of all miners and construction workers, know better.

"The unfortunate and penniless know better. We know doctors whose annual charge off to profit and loss for 'charity' work exceeds the annual pay of officials in the Department of Justice, including the income of the pitiful Cummings himself.

"All this inquisition has to do with New Deal desire to control everything, even to the death rattle of humanity. From the current panorama of incompetents engaged in conducting the Government of the United States, one can picture the brand of treatment the sick and injured would receive under political control stripped of the pride and scientific fire possessed by a vast majority of the medical profession. The people know better."

Editorials of that nature in this type of magazine are very encouraging and I feel it is an indication that if the members of the medical profession will take the lead and make an endeavor to control the care of public health, then innumerable other organizations and magazines of this type will come to our support.

Now that is as far as we can go with the federal intervention in the practice of medicine. One could probably discuss it here for quite some time, but the thing appealing to you gentlemen is that occurring in the State of Nevada right in front of your nose.

NEVADA EXPENDITURES

The report of the State Controller appearing in the Reno *Evening Gazette* under date of September 8, and the heading of "Disbursements for the Fiscal Year Ending June 30, 1938," carries this item: Health and Sanitation, $539,625.23. That is better than $5 for every man, woman and child in the State of Nevada that has been disbursed for the benefit of public health. The Nevada State Medical Association has not had one word to say as to how this money has been spent and who spent it. That is one thing right under our nose and we are permitting the laity to impose upon us gratuitous service, and they get in and take whatever credit of accomplishment may be evident.

The endeavor of the national administration has been to discredit the practicing physicians; their motives, their charges and their interest in public health. I don't think anybody will question these. That is the insidious way in which the present administration and the politicians are attempting to secure control of every activity in the country.

SOME NEVADA PUBLIC HEALTH PROBLEMS

In the State here there are several little things that have occurred and the end result of each and every one of them has been to discredit the medical profession, and in the developing of an antagonistic attitude toward the practice of medicine. In these little instances that I am about to cite to you, there is absolutely nothing personal, they are to be considered as conditions pure and simple that exist and the end result of these conditions arising in Nevada, should be given serious and careful consideration by the members of this association.

First is the controversy between the administration and the Secretary of the State Board of Health. Over a period of years there has been a rather sad exhibition of the lack of coöperation on the part of the political administration with the health administration in this State. Now, then, prior to this appointment we had a very efficient, competent and well liked Secretary of the State Board of Health. For reasons best known to the administration they saw fit to make a change and they made this appointment. After the appointment was made some controversy arose and in order to exhibit dislike for the individual, the health program of the State was retarded and interfered with through lack of coöperation on the part of the administration with the State Board of Health; that is, the advancing of funds and the proper attitude toward health conditions and supervision of the health of the people of the State. The result of this controversy has been to discredit the medical profession in the minds of the public. I don't think we can get away from that.

Until quite recently there has been no permanent appointment made of the chairman of the Nevada Industrial Commission. For nearly four years now this chairman has a day to day job and we all know how potent a factor the Nevada Industrial Commission is in relation to the health of the workers of the State.

The State Director of Venereal Disease Control Board and the Washoe General Hospital controversy has done anything but reflect credit upon us as practitioners and our association. One example of the control of disease by the laity was the recommendation that was made to the director that these individuals be taken out of the hospital and given a floater; the director contending that these individuals at that time were in the communicable stage, while the viewpoint of the politician was to get them out of the hospital and turn them loose upon the public in some other community and in due course of time create a financial burden along with misery to go down through the years. This is hard to comprehend but that was the attitude they took and that is an example of the way the politicians will handle the situation.

A few years ago we had this spectacle at a political banquet. The staff of a large state institution was gathered at this banquet and they set upon the table a placard proclaiming to the gathered delegates, or to the gathered politicians, that this organization was 100 per cent for a certain political party. Now, then, following that, at the session of the legislature there came a recommendation from the administration that buildings be created at this institution to cost approximately $200,000, not, mind you, for the benefit of the inmates, but for the benefit of the attendants. Is there any relationship between this proclamation of 100 per cent support for a political party and then two years hence the recommendation of the construction of $200,000 worth of buildings for those same attendants, when you take into consideration a population of 356 inmates and that at that time the report of the head of the institution showed there had been $350 spent for medicines and drugs. Maybe they are related. Maybe they come together in the control of the practice of medicine.

The results of this program at the present time to the present day have been dissatisfaction with private medical care instilled in the minds of the public; that charges by private practice are excessive; the furnishing of medical services to people well able to pay for nothing or at a greatly reduced charge; lack of appreciation for adequate and competent medical services; and the creation of resentment in the minds of the public toward the profession. Now in one day or one month or one year it isn't expected that this association can become active politically and correct or prevent the development of this undesirable condition, but we can at least start and we can outline roughly a program for the activity of this organization for this following year and as we get into it and develop it, we will have to develop a big program.

Now this probably will sound revolutionary but the fact remains that the status of the physician has materially changed. We are not in a position today to take onions or chickens in payment for our services. We must have the coin as that is demanded of us in order to pay our bills. Now, then, if the politicians are in control or attempting to assume control of the public health, it behooves us to assume an active participation in politics and to make our influence felt. A politician only understands one language and that is the language of votes; and when you can show him that an organization is in a position to materially influence the votes, you are going to get consideration in proportion to the number of votes that you can deliver on election day. Unfortunately that is not a nice procedure. It doesn't reflect credit upon anybody but at the present time that is the way the game is being conducted and until such time as we can change that, we must play the cards the way they are dealt to us and I think that this organization and every individual physician should take an active part in politics. We should have an active and aggressive legislative committee—a committee which will promulgate legislation that is to our benefit and the benefit of the public—a committee who will have their eyes open at all times and attempt to block legislation that is detrimental to the public health and to the practice of medicine. This committee should have the united support of the profession, with the insistence that this organization be consulted and our wishes given every consideration when appointments of a medical nature are to be made by the administration.

In other words, I feel that in the appointment of any man to a position that has to do with the public health program or in charge of our institutions, that the endorsement of this association should be secured; that he should be appointed for his standing in the community; his standing among physicians of the state and his qualifications to handle the position, not to pay some political debt, and I feel that this organization should make that fact evident to the politicians. We must prepare a legislative program that will safeguard the health of the public and enhance the standing of the profession in the public esteem and regard. Now, of course, that is a life program, but it is a start, and as we accomplish one or more of these objectives, we are going to extend ourselves and in due course of time we are going to be the directing factors in regard to the care of the public and the care of the public health rather than the politicians and that's the battle today, gentlemen. They are taking the control and the care of the public health and the private patients, if you please, out of the hands of the medical profession and turning it over to the politicians. That is the condition that confronts us, and it behooves us to become active and prevent the further development of this program.

TUBERCULOSIS IN SAN QUENTIN

By Leo L. Stanley, M.D.
San Quentin

II*

Discussion *by Robert A. Peers, M.D., Colfax; Carl R. Howson, M.D., Los Angeles; F. M. Pottenger, M.D., Monrovia.*

DISCUSSION

Robert A. Peers, M.D. (Colfax School for Tuberculous, Colfax).—There are, to me, among other things, two most interesting features in Doctor Stanley's report. The one is historical; the other is the practical method of attack on tuberculosis, instituted when, in 1913, he became resident physician at San Quentin.

First, the historical aspect: As one reads through the report, he is struck by the manner in which it portrays so clearly the changing viewpoint on tuberculosis from 1851 and through the decades which follow. One can make a few comments on these changes.

San Quentin was established in 1851, thirty-one years before the announcement by Koch of the discovery of the tubercle bacillus, and more than forty years before the discovery of the roentgen ray.

Thus it is not strange to note the references to the crowding together, in confined areas, of the sick and the well without respect to contagion; likewise, also, the suggestion in one report that tuberculosis falls in the class of hereditary disease. Nor is it strange that pleurisy was considered a separate disease entity and that deaths were recorded as due to this symptom.

The report of 1885 makes no reference to the discovery of the tubercle bacillus, which is not surprising to those who remember how long a time elapsed before Koch's findings were universally accepted.

The report of 1890 coincides with the pandemic of influenza in 1889-1890, and the recognition of the relation of influenza to the reactivation of tuberculosis is recorded. The quotation from this year affords the first evidence in all these reports of the recognition of the infectiousness of tuberculosis. Likewise, in this period, we note an ever-increasing number of consumptives among those sent to penal institutions, which probably reflects a growing awakening in the ranks of the medical profession, with an increase in diagnostic acumen.

Just one other note on the historical aspect of this subject: In the preceding paragraph is noted the recognition of the infectiousness of tuberculosis when Doctor Eagle protested against making Folsom Prison a "sanitarium," and against the foisting "upon it the burden and care of the bacillus-bearing criminal," saying, "strict isolation must be resorted to." Here creeps in the first note of fear of the consumptive; a fear that was to grow until, before many years, the tuberculous were shunned as lepers, and treated shamefully and cruelly.

Now let us examine Doctor Stanley's solution of the problem, beginning in 1913 and continuing to date. From the first there was recognition of the double responsibility he faced:

1. The protection of the entire prison population—the public health problem.
2. The care or alleviation of the patient's illness—the medical and surgical problem.

The public health problem in the control of tuberculosis, as in the control of every infectious disease, resolves itself into case-finding and isolation. Fortunately for the prison population, Doctor Stanley had the active sympathy and support of a truly great prison administrator, Warden Johnston. The partnership of Doctor Stanley and Warden Johnston was to work miracles. A thorough physical examination of all entrants was established. This meant early case-finding. A special hospital for the tuberculous was prepared and equipped. This meant isolation.

The modern treatment of the sick tuberculous implies proper medical supervision, good hospital care, rest, and time. At San Quentin all these factors in recovery have prevailed. Good hospital care, with its implied sanitary surroundings, fresh air and an abundance of good food, have been supplied. The element of time has been taken care of by the judiciary. The rest factor has been supplied by hospital beds, plus the surgical-rest features of pneumothorax, phrenic interruption, thoracoplasty and other measures in the capable hands of Doctor Stanley and his associates, for rest of the diseased lung.

It might be well here to add two other historical notes gleaned from the record: In 1879 the death rate at San Quentin, mostly from pulmonary disease, was 17 per 1000. Today the death rate from tuberculosis is 2 per 1,000.

Anyone who knew San Quentin before the days of Doctor Stanley, and who knows the San Quentin of today, can see in the story of tuberculosis at that institution a wonderful example of what can be done with poor mental and physical material, in extremely unsatisfactory surroundings, when the problem is approached with enthusiasm, humanitarianism, and intelligence.

⁂

Carl R. Howson, M.D. (1930 Wilshire Boulevard, Los Angeles).—To convey a complete picture of the horrible conditions existing in the prisons of civilized countries during even the past century it would be necessary to describe the indescribable. Only by a consideration of one phase at a time can we conceive of the situation.

Doctor Stanley has given us a startlingly graphic account of conditions as related to one communicable disease. He has sketched only the outlines. Actual experience with tuberculosis enables one to fill in some of the details.

He has, however, scarcely given proportionate space to his own accomplishments in remedying the formerly intolerable conditions and in providing adequate, modern, and humane facilities for the care of the tuberculous prisoners. Whatever one's criticisms of certain elements in our modern penalogic administration may be, there can be nothing but commendation in this case.

It is interesting to note that since the beginning of the century the reduction in mortality rate has been practically in the same ratio as that of the general population. With all modern aids, their present mortality rate still approximates that of the general population in 1900.

One wonders whether, with this group of individuals, it will decline any faster than the much slower decline it seems we have now to expect in the general death rate from this disease.

⁂

F. M. Pottenger, M.D. (Pottenger Sanatorium, Monrovia).—Doctor Stanley has given us an excellent history of tuberculosis in San Quentin.

It is very interesting to note that in the early years most of the tuberculosis was among Indians and Mexicans, and that it was the greatest cause of death in the institution.

In 1883, out of thirteen deaths eight were caused by tuberculosis; in 1885, out of twenty-nine deaths eighteen were caused by tuberculosis and three by scrofula; in 1889 and in 1904 one-half of all deaths were caused by tuberculosis.

In 1913 the picture changed. Doctor Stanley took charge of the work and brought to the institution modern health measures. He was especially tuberculosis-minded. A new hospital was built, and an examination of the chest of new arrivals was instituted. The result is most graphically shown. In 1913 there were sixty cases of tuberculosis in a population of 1910; and in 1934, after the measures for the control of tuberculosis had been existent for twenty years, there were only forty cases in a population of 6,400.

At the present time there is made a complete examination, with x-ray, of every entrant into the prison.

---

* Part I of Doctor Stanley's paper (its text) appeared in last month's issue, December, 1938, on page 436.

Under the old condition of crowded unsanitary quarters such as existed fifty years ago, the death rate from tuberculosis was 17 per 1,000, while in 1937 it was 2 per 1,000. This still shows, however, that there is an exceptionally large number of the inmates of San Quentin who have tuberculosis. This makes the death rate from tuberculosis among the prisoners about equal to or a little greater than that of those who live in unsanitary quarters in their homes. While the death rate from tuberculosis in the general population of the United States is about 53 per 100,000, the death rate among negroes and Mexican city dwellers still runs from three to five times that figure; and in certain northern cities the death rate among negroes is seven times as great as that among the whites.

This contribution gives us a glimpse of what can be accomplished among an unfortunate group of people when treated humanely.

THE LURE OF MEDICAL HISTORY†

PLAGUE EPIDEMICS IN SAN FRANCISCO: HISTORICAL NOTES

By George H. Evans, M.D.
Berkeley

PART III*

THIRTY years have elapsed since the events here narrated occurred. Probably the dominating rôle played by the State Medical Association in conceiving and carrying to fruition the organization of the Citizens' Health Committee is forgotten, even by the older medical men. It was, I believe, the first time that the organized profession of California has ever undertaken an active and leading part in the carrying out of any public health emergency measure. Had not such a radical measure been undertaken, however, epidemiologists generally concede that a federal quarantine would certainly have befallen San Francisco.

PLAGUE: WHAT OF THE FUTURE?

What of the future? Has the work of the Citizens' Health Committee been productive of permanent results? Is San Francisco immune from the danger of further visitations of plague epidemics? At the last meeting of the Executive Committee of the Citizens' Health Committee the attention of the chairman was called to the necessity of some form of perpetuation of the Committee's activities if its work was to endure.

That present methods of eradicating rats in San Francisco are not entirely successful is indicated by the frequency with which they are observed. To what extent are householders generally observing the rigid rules laid down and strictly enforced in 1908 regarding the keeping and disposal of garbage and protection of all food from rodents? Of the rigid sanitary and building ordinances adopted in 1908 by the Board of Supervisors at the direction of the Citizens' Health Committee, how many of them are today strictly enforced?

PLAGUE TODAY WIDELY SCATTERED AMONG PACIFIC COAST RODENTS

The danger becomes the more apparent when it is realized that plague is today enzoötic in California over widespread foci among the wild rodents, particularly the ground squirrel. Foci of infection exist as far north as Modoc County, as far south as Los Angeles, as attested by the specimens sent to the State Hygienic Laboratory. Nineteen counties have been found to date to be infested with squirrel plague. Numbers of sporadic human cases have occurred in these infected counties, the last one in Tulare County in 1934.

PNEUMONIC PLAGUE OUTBREAKS IN OAKLAND AND LOS ANGELES

A particularly disquieting aspect of this squirrel infection is the frequency of the occurrence of pneumonic plague. The outbreak of the epidemic in Oakland in August, 1919, was clearly demonstrated to be of squirrel origin. It caused twelve deaths, two of whom were physicians. In the Los Angeles epidemic in 1924, out of thirty-two pneumonic plague victims thirty died.

Unsurmountable difficulties beset the epidemiologist in any attempt to overcome such widespread infection. Dr. W. H. Kellogg, Chief of the State Hygienic Laboratory, with his great experience on this subject, has truly said: "These endemic foci, constituted as they are of wild rodent infection, are, so far as anyone knows at present, permanent and everlasting."

DANGERS INHERENT IN THE ENDEMIC RODENT FOCI

It is apparent that there exists in California at present a natural reservoir of plague in these wild rodents, comparable to the historic foci in various Asiatic sections. Such endemic foci have more recently been established in Manchuria, accounting for the pneumonic epidemics which occurred there in 1910 and 1916. Plague may lie dormant in these endemic foci for considerable intervals between epidemic or pandemic spread. It is possible that in such intervals a relative immunity among the rodents may be established. That this may be true in California at present is suggested by the large number of infected fleas recently examined at the State Hygienic Laboratory which have been combed from the bodies of rodents free from infection. In the period from April 1 to August 1 of this year, of 3,416 squirrels examined at the State Hygienic Laboratory, only eight were found to be infected.

VIGILANCE AND PROTECTIVE MEASURES NEEDED

Discouraging though complete eradication of infection from these widespread endemic foci may be, we should be ever vigilant in the furtherance of preventive measures to protect our populous centers from such epidemics.

---

† A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

* In three parts. Part I appeared in the November issue, on page 383. Part II appeared in the December issue, on page 458.

An interesting sidelight on the infestation of rodent animals in California and other Pacific and Western States is revealed in the article, Sylvatic Plague, by Karl F. Meyer, M.D., and B. Eddie, M.A., which appeared in California and Western Medicine, December, 1935, on page 399.

If space permits, an interesting chapter on the part taken by the United States Public Health Service in the San Francisco plague outbreak, from the pen of Medical Director A. M. Stimson, will appear in the February issue.

The California Medical Association rendered an invaluable service to San Francisco in 1908. Has not the medical profession, through its state and county organizations, a higher responsibility to society by assuming a leading rôle in advancing public health protective measures than in its pursuit of its purely academic and economic activities?

CLINICAL NOTES AND CASE REPORTS

DERMATITIS, URTICARIA AND AGGRAVATION OF NASAL SYMPTOMS FROM ORAL ADMINISTRATION OF POLLEN SUSPENSIONS

By Joseph A. Pollia, M.D.
Los Angeles

TOUART,[1] Black,[2,3] Gatterdam,[4,5] Kestern et al.,[6] Barksdale,[7] Stier and Hollister,[8] covering a period from 1922-1937, reported the use of pollens and their extracts by mouth in the treatment of hay fever and asthma. The amounts which were given varied from four minims of the 1:100,000 to 15 cubic centimeters of the 1:20 of the extracts. As a rule it was given daily, either continuously during the period of hay fever incidence, or for three to four days.

In none of these reports is there any note of the occurrence of any remarkable systemic reactions, even though the general trend of the conclusions was that oral administration of pollens and extracts was a very satisfactory method of treating the respiratory manifestations of allergy. Since 1933 the author, after a personal communication with Gatterdam,[9] began to administer pollen suspensions in physiological salt solution. Invariably, cases in an acute stage obtained relief by oral administration. However, out of a number of cases treated in this manner, three showed reactions with minute quantities of pollen suspensions.

REPORT OF CASES

Case 1.—A man, age forty-five, showed several questionable reactions from scratch and intradermal tests. However, the one from orris root was definitely positive. Three drops of 1:10,000 suspension of orris root in physiological salt solution was then taken once daily after breakfast, with instructions to increase one drop each day. After taking five drops once, the patient broke out with discrete patches of red, itchy dermatitis all over the body, which was relieved by ephedrin. The medication was discontinued for two weeks and the skin lesions completely disappeared; and when the medication was resumed, and he took five drops again, the same phenomenon occurred. After this second episode, further treatment was refused.

Case 2.—A female, age forty-six, with headaches and abdominal pain suggesting gall-bladder disease but without any evidence to confirm the diagnosis, was tested and showed multiple sensitivity. She was given a suspension of a mixture of 1:4,000 of each of the following pollens: Bermuda grass, burr, slender and western ragweed, and then instructed to make a 1:10,000 concentration by adding nine drops of water to one drop of the mixture. Because of the marked response to the testing, she was advised to take only one drop of this higher dilution once daily after breakfast and increase one drop each day. The patient was able to increase the dose up to seven drops of the 1:1,000. This dose provoked a severe rash and hives after each administration. Cutting the amount to one minim daily did not relieve the skin lesion and, therefore, all medication was discontinued for two weeks. When it was resumed with the same 1:10,000 ratio, she found that after taking even one drop daily there was a sensation of itching, and it was not until the frequency of this one minim was reduced to every third day that these symptoms were under control. She is still under treatment, and it is planned to increase the dose not oftener than once a week. The abdominal complex has not recurred since treatment was begun, and the headaches have been reduced in frequency and in intensity.

* * *

Case 3.—A male student, age twenty-one, suffering from repeated and long-continued attacks of severe sneezing, showed moderate reactions to Russian thistle, black walnut, desert and eastern ragweed. He was given a mixture of 1:4,000 pollen suspension of these materials, and instructed to take three minims of a 1:10,000 dilution made with water every morning after breakfast, and then to increase one drop daily. Profiting by previous experiences, he was instructed to increase one minim of 1:10,000 every third day. When taking five minims the simple, severe sneezing developed into a running nose and definite pharyngeal and laryngeal sensations. The medication was then discontinued when the symptoms ceased, although the sneezing remained. On resuming the treatment the same aggravation—running nose, dry cough—recurred. Then medication was again stopped, and on taking it the third time five minims produced the same symptoms again. Only when medication was administered twice a week, with increase of dosage once a week, was the aggravation of the nasal symptoms controlled.

IN CONCLUSION

Out of about one hundred patients treated with oral administration of pollen suspensions, three of them gave unexpected reactions following administration of varying amounts of 1:10,000 pollen units.

269 South Lake Street.

SPONTANEOUS HEMATOMA OF THE ABDOMINAL WALL

FOLLOWING RESPIRATORY INFECTION

By William H. Snyder, Jr., M.D.
Hollywood

THE occurrence of acute abdominal symptoms during the course of, or following an upper respiratory infection, should suggest the possibility of a spontaneous hematoma in the rectus sheath. Little or no attention is given to this condition of the abdominal wall in textbooks of surgery, yet a number of such cases have been reported in the literature of the last two decades. Pain, tenderness, abdominal mass and signs of peritoneal irritation, following a coughing spell during a respiratory infection, can be the result of a spontaneous hematoma of the rectus muscle. The abdominal con-

TABLE 1

Author	Year	Type of Respiratory Infection	Duration of Abdominal Symptom	Preoperative Diagnosis	Operative Findings
Balgarnie	1919	Severe influenza—eight days	Two days	Appendicitis	Massive hematoma right rectus
Behan	1920	Influenza a few months before	Five days	Rupture, right rectus, ? appendicitis	Ruptured right rectus

Mainland	1936	Mild chronic cough	Five days	Twisted ovarian cyst	Right lower rectus hematoma
Henderson	1936	Mild influenza with dry cough			

dition is almost always misdiagnosed, and the patient is operated upon for a twisted ovarian cyst, appendicitis, strangulated hernia, or other acute abdominal emergencies, when the true condition is a rectus-muscle hematoma.

REPORT OF CASES

CASE 1.—The first case was that of a 36-year-old white, married female, who on March 4, 1937, immediately after a moderate coughing spell, complained of sudden pain in the right lower quadrant of the abdomen. The pain was constant and quite severe, but the patient was able to finish the preparation of her evening meal and to partake lightly of it. During the night the pain was so bad that she could not sleep, and toward morning she cried and moaned. It seemed to come in waves of increased severity, which would last for an hour or two, and then subside somewhat only to recur again after a short time. Any slight motion of the body increased the pain. The patient was more comfortable with the knees slightly flexed. There was no radiation of the pain. There was slight nausea, but no vomiting. There was a slight bowel movement twelve hours after the onset of the pain. There were no urinary symptoms. The last menstrual period was normal, and occurred three weeks previously. The patient was just getting over an upper respiratory infection which had lasted about ten days, and was associated with a moderate cough.

Ten years previously the patient had been operated upon for appendicitis and salpingitis, although she was not sure what had been done. Since that time she had been quite well except for one attack of lower abdominal pain and fever, which lasted a few days. This occurred about a year previously. Her general health had been excellent. She had several incomplete abortions many years ago, but no pregnancies during the last ten years.

Fifteen hours after the onset of pain she was sent to the Hollywood Hospital. Examination at this time revealed a well-developed and well-nourished woman with agonizing right lower quadrant abdominal pain. Her temperature was 98.8 degrees Fahrenheit, pulse 78, blood pressure 120/80. She had a rather loose cough with a few moist râles at the left base. The abdomen was rigid in the right lower quadrant, with extreme tenderness extending fairly high on the right side. The left side was comparatively nontender and soft. Peristalsis was audible on the left, but not on the right. Pelvic examination revealed a mass about the size of an orange in the right vault which was very tender. The extreme abdominal tenderness made bimanual examination unsatisfactory. Laboratory examination revealed a white blood count of 16,400, a red blood count of 3,900,000. The Schilling showed eight stabs, fifty-eight segmented forms, with no juveniles. The polymorphonuclear leukocytes represented 85 per cent of the count.

The patient was operated upon, with a diagnosis of twisted ovarian cyst. The old midline scar was excised, and just below the dermis the tissues were hemorrhagic. As the fascia was cut and the undersurface of the right rectus exposed, a fresh blood-clot was found to extend downward properitoneally into the pelvis. The mass was about the size of a large orange. Examination of the rectus muscle showed it to be torn in places with extensive areas of hemorrhage. Several bleeding points were ligated, and the deep epigastric artery and vein were ligated above and below the area of hemorrhage. The hematoma was removed and two Penrose drains were inserted. The patient made an excellent convalescence, and the wound healed firmly.

* * *

Case 2.—The second case is that of a 50-year-old white female, seen at the Los Angeles County Hospital. She was recovering from an attack of "influenza," and after a severe coughing spell she experienced a sudden distressingly sharp pain in the left lower quadrant. The pain persisted and was of a severe aching character, not colicky. She had had no such pain previously, and no other important symptoms. She had had a bowel movement the previous day, and enema on admission produced good results. There was no history of bloody or tarry stools or vomiting. The only important feature in her past history was a panhysterectomy two years before for a "tumor of the cervix."

Physical examination revealed a fairly well-developed and well-nourished elderly female, rather acutely ill. She still showed signs of a recent respiratory infection, a mild rhinitis and pharyngitis, and some râles in her right base posteriorly. Blood pressure was 160/100. Her abdomen was of normal contour, but showed a soft tender mass about the size of a fist in the left lower quadrant. There was no tympany, rigidity or distention. Pelvic examination showed absence of uterus and cervix. There was no induration of the broad ligament. Rectal examination was entirely negative.

Laboratory examination showed a leukocyte count of 8,600 with 66 per cent polymorphonuclear cells. The urine was negative except for a few granular casts.

Preoperative diagnosis was incisional hernia with incarcerated omentum. There was a mass over the left lower quadrant midway between the anterior superior spine and the umbilicus, and about two inches below a line drawn between these two points. A left rectus incision was made over the mass. The fascia was incised and its edges retracted and separated by blunt dissection from a mass immediately below the fascia. The dissection revealed a blood-clot about 4 by 5 centimeters in diameter. The clot was removed and the space mopped clean. Then it could be seen that the fibers of the left rectus were ruptured, apparently, as cleanly as though cut with a knife. This transverse rupture extended about two inches in width. The ends of the ruptured muscle were sutured with plain catgut and the dead space closed. The fascia and skin were closed. The patient made an excellent recovery.

COMMENTS ON THE LITERATURE

The cases of hematoma of the rectus muscle listed in Table 1 have been culled from the literature. Each case recorded was either suffering from an upper respiratory infection at the time or had recently been affected: furthermore, all were operated upon for an acute abdominal condition, and in only two cases of the twenty-one cases was the preoperative diagnosis made correctly.

A study of these cases reveals that:

1. Twenty-one cases of massive hematoma of the rectus muscle following respiratory infection have been recorded in the literature.

2. In nineteen out of twenty-one cases there was a mistaken diagnosis.

3. Two cases were considered preoperatively as appendicitis.

One case was considered preoperatively as acute gall-bladder disease.

One case was considered preoperatively as ruptured pregnant uterus.

Ten cases were considered preoperatively as twisted ovarian cysts or ovarian tumors.

4. The condition occurred in patients from eleven years of age to seventy-three years of age. It is found predominating in female patients. Three were pregnant.

These cases represent only a special group of rectus hematomas occurring in patients with a respiratory infection. The cause of these hematomas can best be explained as the result of a general infection, producing degenerative changes in the rectus muscle. That degeneration of muscles is a result of a general infection has long been believed. Zenker described it as occurring in typhoid. Rost (Culbertson) has reported two such cases. The proof that influenza is a causative agent of muscle degeneration appeared in the literature following the great influenza epidemic of 1917. Klotz reported fourteen autopsy cases showing degeneration of the rectus muscle, of which six were ruptured. Gage reports Wolbacks necropsy findings of rectus muscle degeneration in nine cases. Beals Blanton and Eisendrath reported eight cases of hemorrhages and rupture of the rectus muscle in autopsy of patients dying of influenza.

IN CONCLUSION

Summarizing the pathological changes reported by these authors, we find that there is a primary degeneration of muscle tissue with spontaneous rupture followed by hemorrhage. If infection takes place, it is of secondary nature. The one constant change accompanying the degeneration is the early loss of staining qualities in the muscle fibers. Later the areas take on a waxy appearance and finally either rupture or end in scar formation. The pathological changes may occur anywhere in the rectus muscle, but are usually found in the region between the umbilicus and the pubis. They were also found in other muscles with less frequency.

SUMMARY

1. Two cases of upper respiratory infection developing massive hemorrhage of the rectus muscle

which produced symptoms and signs suggestive of an acute abdominal condition are reported.

2. A summary of similar cases in the literature is furnished.

3. An explanation for massive hematoma in the rectus muscle, occurring in upper respiratory conditions, is presented by a study of autopsy findings of the influenza epidemic of 1917.

4. The practical surgeon is enjoined to consider rectus-muscle hematoma in cases of the acute abdomen following a respiratory infection.

FOOD POISONING APPARENTLY DUE TO HOLLANDAISE SAUCE

By J. C. Geiger, M. D.
and
W. J. Ragan
San Francisco

THREE separate and unrelated outbreaks of food poisoning were reported to the San Francisco Department of Public Health. The illness was estimated to have affected several hundred persons. The third outbreak was reported in December, 1937. All the outbreaks occurred in a first-class hotel; and though suspicion was cast upon the "Hollandaise sauce" in each, none of the sauce was available for examination except in the last. In this outbreak twenty persons were affected.

The clinical evidence appeared conclusive for food poisoning—namely, symptoms of nausea, abdominal pain, vomiting, and diarrhea being present two to six hours after the meal. Likewise, the epidemiologic evidence appeared conclusive as to the "Hollandaise sauce" being the causative food factor. The resulting laboratory examination of the "Hollandaise sauce" was interesting. The pH electrometrically was 4.65 after being several days old, but in fresh material the pH was 6.31. Investigation further indicates a wide discrepancy among the chefs of San Francisco hotels as to the manufacture of the sauce, the main difference being the use of vinegar, which was indeed rare, if used at all. The sauce generally consists of egg yolk, melted butter, salt, cayenne pepper, with a small amount of lemon juice, and no vinegar, strained through cloths. This composition, with its pH, coupled with the fact that the sauce may be "incubated" or kept warmed on or in a steam table for twelve to eighteen hours, suggests that the presence of demonstrable hemolytic staphylococci and the production of gastro-intestinal irritant substances, may be due entirely to growth of the organisms. The causative sauce revealed numerous colonies of hemolytic staphylococci, which organisms, when grown in sauce made similarly, proved toxic when injected into laboratory animals. Examinations of stools and throat cultures of the food handlers involved in the manufacture of the causative sauce were negative for organisms of the paratyphoid- enteritidis group or for hemolytic staphylococci.

On the basis of the epidemiologic and laboratory evidence it would appear that sauces manufactured as, and containing such materials as in the "Hollandaise" recorded, and stored or incubated for hours in kitchens, offer a suitable vehicle for the production of food poisoning in humans. From the laboratory evidence one might deduce that specific contamination may have been general, such as from ingredients, hands, apparatus, straining cloths, skin or the respiratory tract, and that multiplication of the bacteria was due to the excellence of the medium and of the incubation.

Curiosity as to the source of hemolytic staphylococci cannot be readily or reasonably met, since these organisms are not uncommon in the types found on the skin and in the respiratory tract of man. Since the advent of this group of bacteria into the realm of food poisoning in man, any laboratory evidence so obtained may have to be regarded as circumstantial, and closely allied with the epidemiology. Further, field investigations as to the incidence of hemolytic and other staphylococci in normal foods and their entero-toxico-genicity appear necessary. There is no doubt that the organisms are common and exceedingly difficult to eliminate. Therefore, the question naturally arises as to their appearance in foods not involved in outbreaks of food poisoning. Moreover, what conditions, artificial or experimental, must be linked to have poisonous products produced?

Conclusions. An outbreak of food poisoning, affecting twenty persons, is reported in a first-class hotel from so-called "Hollandaise sauce." The epidemiologic, bacteriologic, and toxicologic evidence appears conclusive as to the food and to the causative organism, hemolytic staphylococci. The specific source of the contamination was not determined. Executive orders, however, of the San Francisco Department of Health now prescribe exact directions for the manufacture, storage and use of such sauces in hotels and restaurants.

ALLERGY TO LIVER EXTRACT

By W. E. Diefenbach, M. D.
and
Anton S. Yuskis, M.D.
La Jolla

ALLERGY to liver extract, acquired as a result of injections, is reported only four times in the American literature and five times in foreign literature. In the American reports, Metzger[1] in 1931 described an asthmatic reaction following the administration of liver extract. Held and Goldbloom[2] described a reaction characterized by an urticaria. Criep[3] described a marked reaction consisting of severe asthma and a generalized urticaria, and Krantz[4] described a generalized urticaria following the parenteral administration of liver extract.

[4] Krantz, Clement I.: Anaphylactic Reactions Following Medication with Parenteral Liver Extract, J. A. M. A., 110:802 (March 12), 1938.

In the foreign literature Engel[5] in 1933 described an immediate reaction consisting of marked weakness, imperceptible pulse, vomiting and a skin rash. A short time later Grün[6] described reactions characterized by a generalized erythema, dyspnea, weakness and vomiting. Roovers[7] reported several instances in which asthma, urticaria and other unpleasant reactions developed. Lasch[8] described two cases of allergy to liver consisting chiefly of urticarial manifestations. Schlesinger[9] reported one of angioneurotic edema. The purpose of this report is to bring attention to the fact that reactions do occur after parenteral liver therapy.

REPORT OF CASE

Mrs. W. H., a white female, age 65, complained of weakness, sore tongue, abdominal discomfort and sporadic attacks of diarrhea. Her past history was negative and she had never received any injections of horse serum.

The only essential abnormal physical findings were: smoothness of the edges of the tongue and a diminution of vibratory sense in the lower extremities. Examination of the blood revealed: Hemoglobin 60 per cent (Dare), erythrocytes 2,900,000 cells per cubic millimeter, leukocytes 5,000 cells per cubic centimeter, polymorphonuclear leukocytes 63 per cent, lymphocytes 30 per cent and monocytes 6 per cent. The erythrocytes were well filled with hemoglobin, but with moderate anisocytosis, macrocytes predominating and poikilocytosis. The leukocytes showed no changes from normal aside from being reduced in number. There was a definite achlorhydria.

From these observations a diagnosis of pernicious anemia was made and liver therapy by injection was instituted. Dilute hydrochloric acid during meals was also given. A good response resulted as the diarrhea, soreness of the tongue and abdominal discomfort subsided. The patient received liver extract (Lederle's) intramuscularly at intervals of seven days for three months without any reactions. Clinical improvement was marked and the patient was instructed to take liver medication orally. She returned to her ranch in Montana and was not seen again for a period of eight months. When she came back she complained of feeling tired in her thighs and legs, as well as of general weakness. Parenteral liver medication was again instituted, and after a short time her condition improved. About fifteen minutes after the fourteenth (total) injection a marked reaction developed consisting of anxiety, accelerated pulse rate, a generalized feeling of warmth which progressed into a moist perspiration and finally a generalized urticaria. Epinephrin was given immediately and relief resulted shortly. Intramuscular injections were discontinued and a liver concentrate by mouth was substituted. At present the patient's health has been restored to about normal.

The cause of these reactions is not entirely clear. Milbradt[10] found that the preservative used which contained the benzine ring was capable of producing these reactions. According to Coca, quoted by Criep, the specific antibodies produced in acquired allergy result from unusual exposure, such as by injection to an unusual substance, as worms, insulin, solution of posterior pituitary and liver. In direct contrast to the specific antibodies found in natural allergy, such as bronchial asthma, hay fever, etc., the specific antibodies in acquired allergy are of short duration, and their presence is usually associated with the finding of other antibodies, such as precipitins and anaphylactic antibodies. Criep in his tests found the serum to show the presence of precipitins against liver extract up to ten months after the initial reaction, but failed to demonstrate the presence of anaphylactic bodies to liver in the serum during a similar period of time. He further found that this type of acquired allergy could not be produced experimentally.

IN CONCLUSION

An allergic reaction apparently to liver extract was observed. This acquired sensitivity is to an organ and not to a biologic source. These reactions are rare, but it should not detract one from the use of liver extract. To the contrary, it should make one be on the lookout for evidence of this type of sentitivity.

7819 Girard Avenue.

I should like particularly, at this point, to make it clear that the Public Health Service has no jurisdiction whatever over local health matters entirely within the states. You probably recall that the Constitution of the United States reserved to the states all powers not specifically delegated by the Constitution to the Federal Government.

Control over local health matters wholly within the states was not among the powers delegated to the Federal Government by the Constitution.

I also wish to emphasize the fact it is not the aim of the Public Health Service, in carrying out this or any other program, to establish a huge federal machine which will have control over all state and local health work in this country.

It is our purpose, on the other hand, to aid the state and local authorities in developing further their own organizations and programs.

The last thing we wish to do is to break down the local sense of proprietorship and the sense of responsibility, among the local people, for support, financial and otherwise, of their own institutions.—C. E. Waller, United States Public Health Service.

In the more than thirty years since the first bureau of (governmental) research was established, American governments have come a long way on the road to respectable public service. Citizen agencies of various sorts have contributed to that progress, and the modern public official, in spite of handicaps, has played a creditable part. The basis of much of this reform has been facts, and "getting the facts" has been the contribution of research.—Lent D. Upson, *The Annals.*

It is the opinion of those who best understand the physical system that if the physical laws were strictly observed from generation to generation there would be an end to the frightful diseases that cut life short, and of the long list of maladies that make life a torment or a trial, and that this wonderful machine, the body—this "goodly temple"—would gradually decay, and men would at last die as if gently falling asleep.—Mrs. Sedgwick.

Health is certainly more valuable than money, because it is by health that money is procured; but thousands and millions are of small avail to alleviate the tortures of the gout, to repair the broken organs of sense, or resuscitate the powers of digestion. Poverty is, indeed, an evil from which we naturally fly; but let us not run from one enemy to another, nor take shelter in the arms of sickness.—Johnson.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

RABIES: ITS PRESENT-DAY PROBLEMS*

I. THE CONTROL OF RABIES IN SOUTHERN CALIFORNIA

George Parrish, M. D. (2188 Live Oak Drive, Los Angeles).—The fundamental principles for the control of rabies in Southern California are about the same as they are in any other part of the country; making allowances for variations which occur with the differences in size of the many subdivisions and with the types of people and the extent of their education. Southern California, unfortunately, has the reputation of having more visionaries of more varieties running loose, than live in all the rest of America. These people appear and take part in public discussions, make false, vindictive and vicious statements, assassinate character by suggestion, treachery and innuendo. They are against everything that benefits mankind, especially if it has to do with medicine, and no amount of reasoning or evidence can or will convert them. They make claims and statements as truths which are devoid of reason or judgment, and which are not supported by the United States Public Health Service, or the state or local health departments. They are mavericks grazing in the pastures of ignorance and willing to remain there.

Relation of Sentiment and Emotionalism to Dogs and Rabies.

A medical authority says a dog has rabies; some childless, husbandless, dog-loving female says the authority is wrong, the dog is only suffering from mental worry, something that will not trouble her! The authority makes a scientific examination and verifies his diagnosis. A fanatic stands outside of the kennel, sees the dog having convulsions, hears its peculiar or characteristic howl and says "worms." She doesn't say whether she is referring to herself or the dog.

If they have ever read any authentic public health literature whatsoever they fail to show it. To them the Rockefeller Foundation is just a figure of speech, while Johns Hopkins is a character in mythology. In their learned discussions they quote among others Dr. Walter R. Haydon of England, a rabid "anti" on everything, who was tried for manslaughter because, in his ignorance of diphtheria, he permitted a child to die unnecessarily; Dr. William Collins, a favorite of theirs, wrote his learned discourses in 1881; Dr. Philip Ricord, was a really fine physician, but he wrote in 1867. They quote other doctors who practiced before the discoveries of Louis Pasteur enlightened us. Occasionally they repeat the words of some modern authority, but when they do, they resort to that time-worn trick of using just those words that fit their purpose and in such a manner as to always distort the meaning which the writer intended to convey.

We are living in an age of exaggerated sentimentality, and this silly mental agitation is attempting to prevent proper means being taken for the promotion of human life. When a man or a woman gets to a point where he loves his dog more than he does his child, when he believes his dog should run at large without restraint and that the child should be locked up if it interferes with the liberty of his dog, then that person is only one jump behind the person who is already institutionalized. Citizens of this particular type have a peculiar social standing, and belong to no special sect, cult, religion or political faith. They are very clannish, avoid others and are shunned by the more educated people.

Unusual Conditions in Southern California.

The great majority of citizens residing in Southern California are fine, high-class, thoughtful persons; but, unfortunately, the reasonable, sane-thinking people—the majority—are too busy with their own private affairs and in making money, to devote any of their time to civic affairs; whereas the average fanatic has no private affairs, but attends to the business of everyone else.

The foregoing preamble is presented to show the type of persons and the obstacles the Southern California health departments have to meet and contend with.

Prevention of Rabies Not an Easy Problem.

The prevention of rabies is often a difficult, expensive and unsatisfactory procedure. On the one hand public health authorities are handicapped by the fact that rabies in human beings occurs infrequently and, consequently, there appears to be no urgent need for waging constant warfare against the malady; on the other hand, too many of the thinking public take too much for granted, believing they will be protected by public officials whether they take an interest or not. Coupled with these handicaps there are many dog owners who are wholly indifferent to the health and welfare of their neighbors.

If a child made a daily practice of running on his neighbor's lawn, tramping down the shrubbery, breaking the flowers and tearing up the grass, he would be soundly spanked and his parents would be called upon to pay the damages. He would probably be regarded as a problem child, and the social workers would be sitting on his doorstep; but these self-styled dog lovers fly into a rage if some regulation is suggested for the dog.

Statistical Data for Los Angeles.

The difficulties encountered in antirabic control can best be presented by means of statistical data. In the first place, Los Angeles has no ordinances which apply to the control of the dog. The dog is monarch of all he surveys. He can tear off your arm or your child's leg, but nothing can be done about it, for he, under the law, is entitled to a second bite before action against him can be taken. A man may be charged with mayhem and put in jail if he bites a fellow who is beating him up; but he is only a man. Southern California needs a comprehensive and complete law which will take care of the dog throughout the year.

---

* In this issue, see press item on Rabies Problem in Santa Clara County, on page 67.

Suggestions Concerning Legal Provisions.

There should be at all times a systematic collection and elimination of all ownerless or stray dogs. No dog should be permitted on any public highway or in any public park unless on a leash, not exceeding six feet in length. A dog accompanied by his owner, if said owner is more than fifteen years of age, may run without leash provided the district is not under special dog quarantine. The owner of a dog, which, in violation of the law, is running at large and bites an individual, should be held legally responsible for all damages.

Any dog roaming at large without leash shall be picked up and taken to the pound. If licensed, the owner shall pay five dollars to reclaim him; if unlicensed, he shall pay for a license plus five dollars for failure to observe the law. There should be a graduated dog license fee. This should be $2 a year for the male, and $4 a year for the female dog, provided this fee is paid during the first three-month period during the year. One dollar extra should be added to this fee if it is not paid until the second quarter, making it $3 for the male and $5 for the female; another dollar should be added for failure to pay until the third quarter and still another dollar for the fourth quarter. This penalty imposed would not only cause owners to pay more promptly, but it would cause more worthless curs to be turned over to the authorities. The leash law would also help thin out the dog population.

People living in one room or in a small apartment in a crowded community, under these regulations, would soon tire of caring for their dogs and get rid of them. At present, most of these people only keep a dog because they do not have to pay any attention to him. They open the door at 6 a. m., the dog disappears until 6 p. m., and gets all his meals out of the neighbors' garbage cans.

Rôle of a Humane Animal Department.

In the collection of dogs the Humane Animal Department should make a monthly report to the state and local health officer covering his activities. In a rabies outbreak when a quarantine regulation has been declared by the state or local health officer, the agency which picks up and impounds the dogs should automatically pass under the directorship of the health officer until the quarantine is lifted. In my humble estimation, the state health officer, and he alone, should place a quarantine on dogs. In most instances he would do so at the request of the local health officer, or it would be done based on reports received by him. This regulation should be inviolate.

According to the United States Public Health Service, one of its most difficult obstacles to overcome in connection with public health is its inability to get scientific and accurate facts to the people. Politics, prejudices and ignorance do much to sway public opinion and distort and mask the truth. The success of preventive medicine in eradicating any communicable disease depends ultimately on the public backing. Medical knowledge is useless unless the moral support of the community is strong enough to translate it into action.

To summarize.

In conclusion, city ordinances or state laws sufficiently strong should be drawn that will control any situation that arises provided they are enforced. The responsibility for bites should be placed squarely upon each dog owner. Moreover, a city should be reimbursed or fully compensated for its financial outlay in preventing human and canine rabies. There should be an all-year effort to rid the community of stray and unlicensed dogs.

The writer believes that each person bitten should receive compensation, whether the bite is provoked or unprovoked. A dog bite frequently involves pain, fright, torn clothing, a doctor's bill, and sometimes hospital treatment, and is a distressing experience. Moreover, a course of prophylactic injections is an ordeal, particularly for children. If the owners of biting dogs were sufficiently penalized, there would be a marked and rapid reduction in such occurrences. Occasionally, resorting to a shotgun quarantine is necessary and satisfactory: it immediately awakens the indifferent public to a sense of actual responsibility. In brief, it is a question of *Science* vs. *Ignorance*—*Sanity* vs. *Insanity*—of the *Majority Public* vs. a *Fanatical Few*.

* * *

II. WHY WE HAVE RABIES IN OUR COMMUNITY, AND WHAT TO DO ABOUT IT

J. L. Pomeroy, M. D. (330 North Broadway, Los Angeles).—It has been stated that, since 1922 up to 1937, we have had in California about 13,000 cases of rabies, and that California leads all other states in the number of such cases. It has been further stated that Los Angeles County heads the list of all counties in the State of California, having over 9,000 out of the total. It seems necessary to review some of the reasons why this situation exists, and what might be done about it.

Statistics for Los Angeles County.

During the last sixteen years our department [Los Angeles County Health Department], which covers about one-third of the total population of Los Angeles County, has averaged 210 positive heads per year. This means that there were approximately 356 positive heads for the remainder of Los Angeles County. From records in our department the first serious outbreak of rabies occurred in 1922-1923, with a maximum of about 850 cases. The disease dropped during the following four years to below 300 cases per year. It again rose to a new level of between 500 and 600 cases from 1928 to 1931, when it again fell for two years to nearly 300 cases per year. Beginning in 1932 it has climbed steadily, increasing each year until it reached 1,800 cases during the year 1937. During 1938, for the County Health Department area, the disease reached a new peak of 26 positive heads during the fifth week. It has declined slowly until the twenty-fourth week, when there were 8 cases. During the past eighteen months there have been five human deaths in the entire county.

It can thus be seen that rabies is one of the more important communicable diseases in health department work. During 1937 nearly $60,000 were expended in fighting this disease. There were 789 persons who received the Pasteur treatment, and over 2,000 individuals had their wounds cauterized with fuming nitric acid.

In numbers of cases handled during 1937, for comparison I give a list of certain other important contagious diseases, notably, diphtheria, 168 cases; influenza, 887; pneumonia, 547; syphilis, 924, and poliomyelitis, 53. There are few diseases communicable to man which have as their carrier an animal with four legs capable of traveling many miles, leaving here and there future foci through the animals it has bitten. Recently, for example, one dog in the course of its travels bit 11 licensed dogs, 3 unlicensed dogs, 1 bull, 4 cows, 21 goats and 5 persons.

Sources of Infection.

Various theories have been propounded as to sources of infection in California. I have heard it expressed many times during the past thirty years that a reservoir exists in the mountains of California, and domestic animals are constantly being infected from this so-called reservoir. Evidence shows, as recorded in the March 26, 1938 State Bulletin, that beginning in the early history of California to date, known cases of rabies have occurred among wild animals in California. At least this factor must be borne in mind. I cannot precisely evaluate the importance of this factor, but I am inclined to believe that in Los Angeles County it does not play a marked rôle. Nevertheless, it should not be ignored. I personally believe that the disease follows the well known biological rule of periodic increases in virulence with rapid spread. It is a well known fact that only about 16 per cent of human beings bitten would develop rabies, and surely with the fur-bearing animals the percentage is much less. And as to the question of carriers we have little knowledge indeed. So far there is no evidence to support the presumption that carriers exist in relation to rabies.

Another consideration that, in my opinion, is important in Southern California particularly is the tremendous tourist traffic, introducing dogs and other animals from all parts of the United States continually. For one reason or another many of these dogs become strays, and unquestionably do introduce rabies not infrequently into our territory.

Control Measures.

Various control measures have been recommended in the handling of rabies outbreaks, and during the last twenty-five years the following have been tried: control of the dog population by requiring an annual license; provision for the impounding and the humane destruction of all unlicensed dogs; and quarantine of all dogs in areas where rabid animals have run at large. Muzzling has never been thoroughly tried in our county, although it has been attempted from time to time. The organization of a County Pound system was first attempted by the Board of Supervisors through contract with private humane animal societies. For various reasons which will be discussed later, this was abandoned approximately two years ago with the creation of a county poundmaster, who collected all stray and unlicensed dogs with his own men and trucks; but the county still continued to house the animals thus collected at private humane animal pounds. The destruction by shooting of all animals at large has never been done in Los Angeles County except during a concurrent hoof and mouth disease outbreak many years ago. Needless to say, rabies vanished within a very short time following the installation of this ruthless campaign. At least there is one rapid method of controlling rabies in the shooting of all dogs found at large during a quarantine.

Quarantine has been successful in the past in controlling relatively small isolated outbreaks. A few years ago in the district known as Belvedere a rigid quarantine was placed under order of the State Board of Health, and in a period of six weeks some 5,000 dogs were captured and destroyed. Rabies was wiped out very promptly.

Problems of Large Areas.

When we come to deal, however, with the situation where a county with a large city such as Los Angeles, likewise infected with rabies, cuts through the heart of the most populated area, the problem has different aspects. Physically, all of the forty-four cities in Los Angeles County are contiguous to the unincorporated areas, therefore epidemiologically, the entire county is the logical field for the spread of the disease as well as the enforcement of control measures. There is no doubt whatever that rabies has been endemic in Los Angeles City at least since 1921, and infected animals have acted as feeders to the remaining area in Los Angeles County.

The present quarantine was the result of the efforts made by Dr. George Parrish, health officer of Los Angeles City, and myself in the spring of 1938. We came to the conclusion that, to be effective, the quarantine must cover the major populated areas in the entire county. In spite of inherent difficulties in enforcement of any quarantine measures such as this is, the records show that, since the spring of the year and following the enforcement of the quarantine, rabies has declined. *It is possible* through a quarantine measure to stamp out rabies, but the measure will never succeed as effectively as it might if we had the hearty coöperation of the people.

Organized Opposition.

The chief reason, in my opinion, as to why we have rabies is that this disease and its resultant enforcement measures inevitably arouses an adverse emotional condition because it disturbs man's relationship with his pets, and because there are large numbers of persons actively engaged in and making a living out of the handling of pets, the organizing of shows and all of the rest of the picture that accompanies this part of human life.

The first real obstacle encountered was an attempt through the courts to strike at the fundamental law. An injunction was obtained by a certain dog organization in Los Angeles which restrained the health officers from enforcing the law for a period of several weeks, during which time, of course, dogs were permitted their freedom. Fortunately for the case of public health, the court decided finally against the dog association, and for the cause of public health. This decision, which is an important one, has been published in a previous issue of this magazine. The attack was directed purely on the interpretation of the law, but it is important to bear in mind that the organization which fostered the attack believes that the licensed dog should be exempt from any quarantine measure. The Court held that: "It is true that dogs are property; that the owners have a property right therein but, like other property, they must be kept by their owners in such a manner that they will not become a menace to other animals or to human beings."

It is important to review the extent locally of the opposition, the effect of which is that rabies may not be stamped out in Southern California. In the first place, there is the natural lack of a sense of conviction of the real danger to any individual concerning rabies. After all, in a large population comparatively few people see a rabid dog, and hence lack personal experience. Furthermore, by comparison, deaths from automobile accidents and other causes are so much greater and so common that it is difficult with many citizens to convince them of the necessity of keeping their particular dog under control. Again, we are to a certain extent to blame because of a lack of an adequate system of education of the public in matters of this kind. I have been amazed to discover the fact that a great many people know little concerning the disease rabies. It is quite apparent that California as a whole lacks a real constructive system of health education in our public school system. Until this is accomplished, health departments can do little. Education in the humane treatment of animals is a byword among school children, but education in communicable diseases is, in my opinion, to a large measure ineffective throughout the state, at least in relation to animal diseases.

Then we have a group called the Antivivisectionists, who are most vehement and most aggressive in their interest to protect dogs and other animals. However, in regard to rabies it is interesting to note that this opposition has softened very considerably in regard to our recent rabies control measures.

Next is a large group which, under the name of Humane Societies, is really interested in the matter from a business standpoint—the impounding and sale of animals. Coupled with this is the group of pet shops and similar organizations whose business is disturbed by any quarantine order.

Recognizing the peculiar emotional reaction which is bound to result in serious opposition in quarantine measures in handling rabies, the writer believes that, as a public policy, the present quarantine in Los Angeles County should not be lifted until local ordinances are made permanent relative to curbing the past freedom enjoyed by the dog.

Author's Suggestions.

We propose the following program:

1. A permanent campaign rigorously enforced in relation to picking up stray dogs.
2. A permanent ordinance requiring dogs at large off the owner's property to be only on a leash.
3. Research looking for a more effective vaccine against rabies, as well as efforts to standardize the effectiveness of the present material used for Pasteur treatment to make sure that it is potent.
4. Educational efforts, particularly among the younger group of people throughout the county.

In Conclusion:

It is the current belief in our department that only through the development of a really efficient protective vaccine against rabies can a material advance in the method of handling this disease be developed. Further, we believe that the State or Federal Government should standardize the effectiveness of the present material on the market in common use for the administration of the Pasteur treatment, to make sure that a potent material is available. Also, we believe that the present state law known as the Rabies Act should be modified and brought up-to-date, as certain aspects of this law are not working properly.

III. IS RABIES TRANSMITTED THROUGH MILK?*

K. F. Meyer, M. D. (George Williams Hooper Foundation, University of California, San Francisco).—It is a well known fact that rabies may be conveyed to herbivorous animals through the bite of rabid dogs, wolves or coyotes. Reports on the epidemic distribution of this disease in herds of cattle are by no means infrequent. Occasionally, milk secreted by a cow, which subsequently is proved to have suffered from rabies, is offered for sale and is consumed raw by a large clientele of the dairy. One is then confronted with the pertinent question: Should the individuals who have ingested the milk be subject to antirabic treatment? A critical evaluation of the available information, in the light of newer knowledge and the formulation of a definite answer, appears imperative. To begin with, it is noteworthy that the views relative to the infectiousness of milk derived from rabid animals have, in the course of years, undergone a number of changes.

Comments on the Literature.

At the beginning of the nineteenth century, the prevailing views concerning the harmfulness of milk derived from rabid animals were changed, when numerous feeding experiments yielded negative results. *Moreover, a careful perusal of the available literature failed, and has failed to record a single case of human rabies which has conclusively followed the ingestion of milk from a rabid cow or animal.* The extensive and fundamental researches by Pasteur and his associates, however, furnished proof that the virus, although present in a concentrated amount in the central nervous system, may be found in certain glands and their secretions. In particular, the salivary and the lacrimal glands, the pancreas and, occasionally, the mammary glands may contain the infective agent. Furthermore, it must be recalled that, just as in foot and mouth disease, the virus may be accidentally transferred and mixed into the milk after it has been collected from the udder, the hands of the milker soiled with the saliva may contaminate the milk. In the classical treatise on rabies (Traité de la rage, 1912, page 270), Babes lists the experiments of Nocard, who found that one of four specimens of milk collected from a rabid dog produced typical rabies when inoculated into a rabbit. On the other hand, Roux made the significant observation that he transmitted rabies to the experimental animals only on one occasion, when he mixed the milk of an infected rabbit with a fragment of the mammary gland, while the secretion gently collected from the organ was noninfectious. Bardach (Ann. de l'Inst. Pasteur, 1887, page 180) proved the presence of the virus in the milk of a woman suffering from rabies both before and after death by testing the secretion on rabbits and guinea pigs. The nursling of this woman consumed this milk until the last day before death of the mother without showing any detrimental effects. These positive findings are contrasted by the extensive experiments of Nicolas (Jour. méd. vétérinare et de Zoölogie, Dec. 31, 1905, page 721), who tested the milk of rabid herbivores, and experimented with animals having received highly infectious material intravenously. Since the milk failed to become infectious, he concluded that the rabies virus is not passed into the mammary secretion from the blood. No rabies virus was detected in the lacteal fluid of a rabid sheep in the careful studies described by Repetto (Riforma med., Dec. 14, 1907). More recent studies have yielded essentially the same results. Mugrage (Jour. Lab. and Clin. Med., 1920–1930, 15, page 460) observed a puppy which had fed on a rabid bitch. The animal developed normally. In experiments on rabbits, he was unable to demonstrate any virus in the milk of the diseased rodents. Probably the most convincing series of tests were conducted by Remlinger and Bailly (Compt. rend. Soc. de biol., 1932, 110, page 239 and Ann. de l'Inst. Pasteur, 1932, 40, page 730), who tested the milk of seven rabid guinea pigs, four cats and one dog. In thirty-nine inoculations of milk, only one sample removed from a moribund guinea pig proved infectious. One specimen of mammary gland removed from a dead guinea pig carried the virus. The latter result was anticipated, since the peripheral nerve tissues are known to be the conductors of the rabies virus. Mechanical injuries leading to tears in the glandular structures of the udder may encourage admixtures of the virus to the milk. From the experimental studies one must conclude that *the milk of rabid animals contains the virus only under exceptional conditions.*

---

* From the George Williams Hooper Foundation, University of California, San Francisco.

More Recent Observations.

A study of the literature presents no data to prove the presence of the rabies virus in cows' milk. The majority of recent investigators are convinced that, as a rule, a number of additional factors contribute to the protection of the public from consuming infected milk. At a time when the secretion may under exceptional circumstances carry the virus, although it has never been proven for cattle, usually the milk flow has dropped off tremendously; the symptoms of rabies are sufficiently definite to warn the dairyman that the cow is sick and the milk probably harmful. Pasteurization promptly destroys the virus. However, there is always the possibility that the accidental contamination of the milk with the saliva of the rabid animal or other extraneous sources may render the food product infectious. If, on inquiry, the statements of the milker remotely suggest such a possibility, one is confronted with another question: Does the rabies virus pass through the intact mucous membrane of the buccal cavity and the intestinal tract? Experimental studies, which date back to the early studies on rabies, leave little doubt that the intestinal canal is not a suitable portal of entry for the rabies virus. Feeding experiments by Hertwig, Delafond, Renauld and, in particular, Nocard were uniformally unsuccessful. That the intact mucous membrane is not permeable was well illustrated by a critical experiment of Nocard (Les maladies microbiennies des animaux, Paris, 1903, 2, page 465). He fed a fox the highly infectious brain material from six foxes and several dogs which had succumbed to rabies. The animal remained well. On the other hand, Galtier succeeded in four instances of thirty attempts to infect rabbits in which the mucous membrane of the buccal cavity had been rubbed with highly infectious brain material. In the light of the present-day views on the pathways of infection, it is obvious that the accidental exposure of a nerve ending by trauma (rubbing of mucous membrane) may create a suitable portal of entry for the virus. The intact mucous membrane may thus permit the passage of the rabies virus. Superficial defects on the mucosa of the mouth and gums, or fissures and cuts on the lips, tongue or upper digestive tract could possibly serve as such avenues of infection. Disturbances in the gastrointestinal tube or inadequate gastric secretion which ordinarily destroys the virus (0.01 per cent hydrochloric acid at 37 degrees centigrade in two hours) may reduce or entirely inhibit the protection against rabies by ingestion. Despite these arguments for a possible gastroinestinal entry of the virus, there must be recorded convincing epidemiologic evidence against this probability. The meat of emergency-slaughtered animals, rabid cattle and hogs has been eaten by large groups of people without any consequences. Even the cadavers of rabid dogs have not escaped this fate. In not one instance have harmful effects been noted (Joseph Koch).

To Summarize.

In conclusion, it may be stated that the scientific data do not seem to justify the antirabic treatment for individuals who have ingested the clean raw milk from a rabid cow. On the other hand, if contamination of the milk with saliva is within the realm of probability, and the milk has not been pasteurized, the physician should weigh carefully the institution of Pasteurian treatment.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

ADDRESS OF PRESIDENT W. W. ROBLEE

AT THE SPECIAL SESSION OF THE HOUSE OF DELEGATES HELD IN LOS ANGELES, DECEMBER 17–18, 1938

Mr. Speaker and Members of the House of Delegates of the California Medical Association:

I extend to you greetings from your elected officers and the Council. You may rest assured that you would not have been put to the inconvenience, and the Association to the expense, of this special meeting if we had not felt that the gravity and urgency of the issues involved made it necessary.

This is the second time in the history of the Association that such a session has been called. In both instances the apparent urgency for the Association to consider the problems connected with sickness insurance was the motivating influence.

WHY WAS THE SPECIAL SESSION CALLED?

The question has been raised by some of our members, "Why the haste? Is the Council trying to put something over on us without giving the members an opportunity to consider the problem with full knowledge and deliberation?" You are entitled to an answer to that question.

Your Association is rendering the individual doctor many and varied services. In addition to the work done at the central office, by your officers and by the Council, there are seventeen standing committees and several special committees which have oversight of Association activities during the interval between annual sessions. Four of these committees have had oversight of various phases of this problem. The sickness insurance problem has been actively before us for many years. The report of the Wilbur Committee on the Cost of Medical Care focused our attention on this subject. Many of you remember the hectic session at Riverside when a plan proposed by the Council was rejected, and in its stead the Committee of Five was created and our own "California Medical Economic Survey" ordered.

That was in many respects a sad and very expensive experience. We did, however, learn some valuable lessons, notably that where any money is involved no bill can pass the Legislature that does not give the politicians control, and that a survey directed by a lay economist is bound to be factually faulty and the conclusions misleading.

Following this experience the agitation within our own ranks for some radical and all comprehensive compulsory action became quiescent in the state. Unfortunately, this happy condition did not obtain elsewhere. Because of present and prospective economic uncertainty on the part of many of our citizens a ready field was at hand for the planting and propagation of many bizarre and curious economic plans. These seemed to center about the problem connected with the aged and the sick. These elements in our population have a universal appeal and were pushed as the "guinea pigs" for mass socialized experimentation.

MOTIVATING FACTORS IN SOCIALIZED MEDICINE

The factors which have brought the problem of socialized medicine before us acutely at this time are:

1. *The Attitude and Activities of the Federal Government:*

The report of the Interdepartmental Committee to coördinate health and welfare activities under the chairmanship of Josephine Roche, with its sweeping recommendations, following as it did the very radical statement by Senator Lewis to the Atlantic City session of the American Medical Association House of Delegates, focussed our attention on the imminence of socialized medicine under federal control. A call was immediately issued for a special session of the American Medical Association House of Delegates, this being only the third time in the history of the Association that such a call had been issued. The attitude of organized medicine was clearly set forth and a committee was appointed to confer with the federal group. This conference was held October 30, 1938. The results were not particularly encouraging. In a joint interview following the conference by Dr. Irvin Abell and Miss Josephine Roche reported in the November 18 *Journal of the American Medical Association* "it was pointed out that the conference had reached no definite conclusions or specific plans for coöperation, nor had there been any abandonment of specific position taken by either group in relationship to the program." Doctor Abel further stated "while tentative agreement in principle, not in methods of application, was reached on four of the recommendations, the conference was stymied by the question of compulsory sickness insurance."

It is, therefore, quite evident that the Interdepartmental Committee will sponsor in Congress, with the approval of the federal officials, measures that, if enacted into law, will make profound and, we fear, detrimental changes in the care of the sick citizen.

The fact that the program is one of subsidy whereby states and local units are obliged to match the federal funds, is a possible way out. If California can be shown that the sickness insurance problem is in process of satisfactory solution here it may serve as a block to the undesirable features of the proposed federal program.

2. *The California State Election of November 8, 1938:*

An election occurred in this state November 8. The result was a political overturn whereby the executive and the assembly portion of the legislative branches of our state government passed into the hands of the Democratic party. Judging from past experience with, and the preëlection statements of, the party leaders, we can expect state medicine to be sympathetically considered, if not actually pushed as a part of the state "New Deal" program. The Legislature meets in January, the voting begins in March, and we, therefore, have only a two and a half months' period in which to inaugurate a program of our own which will in a measure satisfy the radical demands and yet be able to keep the program under our control.

It may interest you to know that on this last Wednesday evening occurred the annual legislative dinner of the Public Health League of California. Various legislators were present. Governor-Elect Olson was en route to Washington, but sent his secretary. The secretary, in substance, spoke as follows:

"I don't want to say very much, but I do want to say a few words about medical insurance. I assume that you gentlemen are prepared to accept your responsibilities and do your duty in this regard, but if you are not we will be obliged to present a program of medical insurance to the Legislature."

3. *Farm Bureau Studies:*

Economic conditions confronting our great agricultural population have been very trying for the past several years. Many of our usually solvent, independent farmers have had great difficulty in securing sufficient return from their crops to remain solvent. The dread of the unusual expense entailed by catastrophic illness hangs heavily over them. Your Council and special committees have had three conferences with the State Farm Bureau leaders. They are a splendid group of citizens and we were able to acquire a knowledge of our mutual problems that will be invaluable.

They desire an insurance program and a moderate liberalization of admissions to the county hospitals. They frankly say that unless we present a helpful program they will consider a connection with a private insurance group and join with those who advocate county hospital admission on as free a basis as are the public schools for the education of their children.

The resolution adopted by the Farm Bureau at the state convention at Sacramento in November reads as follows:

Hospitalization and Health Insurance

"*Resolved,* That we oppose any attempt to limit the use of county hospitals by persons able to pay in part or in whole for the service received; that we sponsor or support the enactment of a law establishing a practical basis upon which licensed practitioners may practice group medicine such as voluntary health insurance and other health legislation which will be beneficial to the farm families and that we continue our study of the rural health problem."

4. *Organized Labor:*

The representatives of organized labor have recently stated to one of our officers that they are expecting us to offer a group program that will be within reach of their members.

He has an appointment with the labor representatives next week to advise them as to what can be our response to their request.

5. *Hospital Associations:*

The existing hospital insurance associations have informed us that there is an insistent demand from their clientele that medical care be included in their coverage. Some rather large groups have left them and have secured the double protection from commercial insurance organizations. They have apparently reached the limit of development as hospital insurance carriers.

6. *The Development of Commercial Insurance Carriers:*

A number of insurance companies, for example, the Occidental Life Insurance Company, Giannini controlled, have met the requirements of the Insurance Commission and are writing indemnity policies which give free choice of physician and hospital. The unsatisfactory feature of these policies is that they indemnify under a fee schedule that is materially below a reasonable professional charge and the attending physician has difficulty in explaining the discrepancy and collecting the difference.

7. *Partnership Groups:*

For example, the Ross Loos Clinic in Los Angeles are serving many thousands of clients in this state.

8. *Corporation Requests for Service for Employees:*

Several corporations and business firms have requested us to furnish medical service on a prepayment basis for their employees, and are awaiting the outcome of our deliberation. If organized medicine does not offer such a service they will seek it elsewhere.

9. *Reaction of the General Public:*

Since the publicity that was given the November 12 Council meeting I have received letters from a goodly number of people inquiring as to how soon the service will be available. I have spoken to some service clubs and they expressed a keen interest in it. The Commonwealth Club has a committee studying the subject and they have announced that they will sponsor a bill in the next Legislature.

10. *Attitude of Physicians:*

I have visited and spoken to many county medical societies during the past month, and have found our members keenly interested in this subject. More than one member has advocated our financing and operating a prepayment sickness insurance organization. The San Francisco Society has had the matter under consideration and the Los Angeles Association, with its 2,300 members, has a plan under consideration for possible use in case the California Medical Association fails to work out one of statewide scope.

11. *San Francisco Public Employees Check Off Medical Service Plan:*

The San Francisco County and municipal employees are already organized on a compulsory payroll deduction basis and are out of the picture. We should forestall other similar efforts.

COMMENT

From this summary it appears that federal and state groups, farmers' organizations, organized labor, hospital associations, commercial insurance companies, business and public employees, and our own members all have converged their influence in such a positive manner that it can no longer be ignored by organized medicine. The imminence of the sessions of the National Congress and our own State Legislature furnish additional reasons for earnest consideration of the problem at this time. A policy of laissez faire can no longer be endured. It should also be noted that while we procrastinate the commercial, fraternal and partnership organizations are taking the cream of the business.

The Council does not underestimate the difficulty involved in the development of a plan controlled by the California Medical Association.

Problems of organization, management, finance, salesmanship, coverage, professional control and conduct all hover very large on our horizon. A perfect set-up will not be initially forthcoming. It is possible that they are right who say that voluntary insurance will never solve the problem. The fact remains that it has worked well with many relatively large private groups. Dr. Roscoe L. Leland, Director of the Bureau of Medical Economics of the American Medical Association, informs us that there are some 3,000 plans being sponsored in this country having to do with the problem of medical care. He is here to advise with us.

PLAN WILL BE SUBMITTED BY THE CALIFORNIA MEDICAL ASSOCIATION COUNCIL

The plan that will be laid before you by the Council for your consideration is the result of intensive study on the part of the special committee which was entrusted with its elaboration. The Council spent all day November 12 considering this matter. It called into consultation several men who have expert knowledge along this line of endeavor. The committee has continued its work and the Council spent all day yesterday in further conference in regard to it. It will now pass into the hands of the Reference Committee, and will then run the gauntlet of your judgment. The final product should be reasonably free from error and, we trust, workable.

An earnest endeavor has been made by the Councilors to meet with as many county medical societies as possible in order that the members might become cognizant of the problems involved. Because of lack of a final committee report only a general discussion of the principles involved could be engaged in. The many criticisms and suggestions made have been taken into consideration by the committee and the Council. The Association is a truly democratic organization, but it has a membership of over 6,000, every one a "rugged individualist." It is not to be expected that all the phases of any suggested program will meet with unanimous approval. Good sportsmanship and the welfare of organized medicine will assure a wholehearted acquiescence in the final decision of this body.

This summary of events and the reasons why you have been called into special session I trust will be satisfactory to you.

202 Mission Inn Rotunda, Riverside.

REPORT OF THE COUNCIL TO THE HOUSE OF DELEGATES

Los Angeles, December 16, 1938.

To the Members of the House of Delegates:

As you all have been advised by the formal notice of this special meeting, the Council, at a special meeting held at San Francisco, November 12, 1938, passed the following resolution:

> *Resolved,* That a special meeting and session of the House of Delegates of this Association, California Medical Association, is hereby called to be held at 1925 Wilshire Boulevard, in the city of Los Angeles, State of California, on Saturday, the seventeenth day of December, 1938, at the hour of nine o'clock a. m. for the purpose of:
>
> (*a*) Considering and acting upon any plan or plans presented by the Council for prepayment of, or pooling funds

for, health services and care, and for the establishment of a state-wide system to render medical service and hospital care;

(*b*) Considering and acting upon a proposal to amend Chapter II of the By-Laws of the Association relating to professional ethics; and

(*c*) Considering and acting upon the formation and organization of a corporation and any other matters ancillary or related to any or all of the foregoing purposes as may be presented by the Council; and be it

Further Resolved, That George H. Kress, the Secretary of this Association, be and he is hereby directed to prepare a written notice setting forth the time and place of meeting and the purposes and objects thereof and transmit the same, signed by him and attested by the President, the Chairman of the Council, and the Speaker of the House of Delegates, to each member of the House of Delegates in the manner and within the time required by the Constitution of the Association.

This report to you will be grouped, for the sake of clarity, under five points, as follows:

1. The Council's reasons for calling the meeting.
2. Discussion of the purposes of the meeting.
3. Discussion of possible types of organization based upon the opinions of our General Counsel.
4. Detailed discussion of possible organizations.
5. Recommendations of the Council.

* * *

1. **The Council's Reasons for Calling the Meeting.**—In the past few months the members of the Council have become thoroughly convinced that the membership of the Association generally, throughout the state, desires to put into active operation a state-wide system for the prepayment of medical services and hospital care through the pooling of funds therefor. Committees have been active in Los Angeles, San Francisco, Alameda, and other counties, and it was the opinion of the Council that the membership of the Association, generally, wanted action on this subject, after many years of study, discussion, and surveys. That the public desires it is evidenced in numerous ways—the growth of so-called "hospital associations," private staffs, activities of employers on behalf of their employees, group action by employees, such as the city employees of San Francisco, the demand of policyholders of nonprofit hospital associations for the addition of medical service, the platform plank of our dominant political party in this state, the unanimous endorsement of such a system by the Farm organizations, and the State Federation of Labor, many of whom are now only awaiting the action we take at this meeting to determine their own course, and the widespread approval and satisfaction with which the announcement of this meeting and its purposes has received throughout the state.

The Council felt that the safest and most successful organization could be worked out by the doctors of the state as a whole and not by the doctors of any particular locality. They further felt that it was necessary that the medical profession evolve, formulate, and control any plan for the establishment of such a service and that, in the interests of the proposed beneficiaries and for the preservation of their own standards, unity of professional leadership through their State Association was and is a fundamental requisite.

2. **The Purposes of This Meeting.**—Succinctly stated, these purposes are first to consider and then to act upon the proposals contained in the notice of the meeting. The undertaking is a large one and it would be futile to attempt it unless the profession of the state thoroughly understands the problems involved in the formation of the necessary organization. The Council's committee, consisting of President-Elect Charles A. Dukes, Lowell S. Goin, and T. Henshaw, Kelly, has presented to the Council its report to which is appended the opinions and memoranda prepared by Hartley F. Peart, Esq., the General Counsel. These reports and opinions and the work of the Committee were reviewed by the Council at a special meeting held yesterday, and the Council believes that every question of major importance dealing with the subject has received careful and full attention. These reports will be presented to you in full for your consideration. The Council believes that the report of the Committee and the opinions of our General Counsel show that this Association can authorize the formation of a proper organization to provide medical and hospital service on a prepayment basis, and, at the same time, preserve all the necessary and indispensable safeguards for the protection of the patient and his doctor. In its progress report to the members of the House of Delegates and to the presidents and secretaries of the component county societies, dated November 26, 1938, the Council's Committee sets forth thirteen points, which are as follows:

1. Creation of a medical service organization to operate on a *nonprofit* basis.

2. All doctors of medicine in the state to be eligible to render services under the plan without special privilege to or discrimination against any individual or group of individuals.

3. Complete freedom of choice to the beneficiaries of the plan in the selection of a doctor of medicine who is willing to render services under the plan.

4. Prepayment of the cost of medical services and hospital care on a monthly budgeting basis, all funds collected to be used for defraying cost of medical services, hospital care, administrative overhead, and the building up of a reasonable reserve for contingencies such as epidemics, etc. Administrative overhead to be maintained at the lowest possible figure, consistent with efficient operation and normal growth.

5. Control of administration and policy of the plan to be vested in the medical profession through its representatives.

6. Restriction of hospital care to matters included in the statutory definition of hospital service, viz., "maintenance and care in hospital, nursing care, drugs, medicines, physiotherapy, transportation, material appliances and their upkeep."

7. Medical services to be paid for out of available pooled funds on the "unit system." The unit system has been determined upon because no other method will insure against insolvency or bankruptcy, and because it is evidence to the public of the good faith of the medical profession in the developmental period of this plan.

8. Beneficiary membership in the plan to be open to all falling within the restricted income groups, as rapidly as arrangements can be made therefor.

9. The scope of medical service is contemplated to include everything except industrial injuries, accidents or illness arising from lawlessness, insanity, chronic alcoholism, and drug addiction. Restrictions necessarily must be placed upon cases of pulmonary tuberculosis, pregnancy, miscarriage, and childbirth.

10. The administration of the plan shall be in charge of a board of trustees selected by representatives of the California Medical Association.

11. A medical director, with necessary assistants, responsible to the board of trustees and employed to serve at its pleasure, shall administer the plan and perform the duties usually performed by a medical director where beneficiaries' funds are pooled. Thé medical director shall be a doctor of medicine, not engaged in private practice.

12. District administration will be developed.

13. The board of trustees to have power to establish rules and regulations governing the administration of the plan.

If, after due consideration and full discussion, the House of Delegates believes that the plan recommended will be for the benefit of the patient, the public and the physician, the proper authorizing resolutions directing the Council to proceed should be adopted.

3. **The Two Possible Forms of Organization Reported by the Committee Based Upon Legal Opinions.** On this point it may first be said that up until recently the opinion was current that such a plan as here proposed would require enabling legislation. Recent decisions, however, which show the judicial trend, have led our attorneys to conclude that two types of organization are possible without legislation, with more than favorable chances of their being sustained on judicial review. Suggestions of operating in any unincorporated form, such as a partnership, a trusteeship or an association, are rejected by our legal department for the reasons set forth in an opinion rendered the Committee.

It has also been suggested that the Association could enter into an agreement with a group of insurance companies or a single insurance company and thereby disassociate itself from the handling of funds or engaging to the extent necessary in the administrative work involved. The Council disapproves such suggestion for the reason, first, that to enter into such an agreement inevitably subjects the medical profession to the domination of business capital and, second, that it is not consonant with the purposes desired and would be an attempt to ally a progressive, social and benevolent project with a group of shareholders operating a business for profit. The fundamental idea upon which the Council is proceeding is that the medical service to be rendered shall at all times operate on a nonprofit basis and that the recipients of the service and the physicians and others rendering service, shall be the only parties to the plan.

4. **Two Types of Medical Service Organization Are Possible.**—Our Legal Counsel reports that two types of organization are possible, namely, (*a*) a nonprofit membership medical service corporation, and (b) a nonprofit mutual membership insurance company. The advantages and disadvantages of these two types of organization are summarized in the opinions of the Legal Counsel to the Council Committee.

It appears to the Council that the nonprofit membership medical service type of corporation is by far the more desirable and, while there is no decision of the courts in California directly upon this subject, we direct your particular attention to the quotation given in the Legal Counsel's opinion from the decision in the case of *People* vs. *Pacific Health Corporation*, and to the decision rendered by the United States District Court in the District of Columbia, decided only last July, and covering the two most important points at issue.

The Council believes that the public support of a carefully organized nonprofit membership medical service corporation by this Association, operated prudently and carefully, would be the fulfillment of a public demand of the greatest benefit to the public of the state and that, with some necessary adjustment of thought and action, it would be of direct benefit to physicians themselves.

It will be noted that each of the corporate types presented preserves the essential fundamentals. The projected bylaws contain several matters to which the Council wishes to direct your particular attention: (1) that all doctors of medicine in the state are eligible to render services; (2) the beneficiaries have complete freedom of choice; (3) that the control of the administration and policy is to be vested in the medical profession through the Council of the California Medical Association; (4) the medical services are to be paid out of available pooled funds on a unit system. Some criticism has been voiced on this provision, but it should be borne in mind that such a system affords freedom of action, insures the success of the plan and if dues are not placed at a proper figure they can be rectified at any time. The situation is entirely different from that where the doctors agree to work on a unit system with dues fixed by an intervening agency over which the doctors have *no control*.

District Administration.—So far as possible district administration will be put on an autonomous basis. In the discussion the Council suggests that discussion here should be centered upon fundamentals and not upon details. It will be impossible to work out or decide the many details in the inauguration of a state-wide plan such as this in the deliberations of this body. The type of plan that the profession desires, and its fundamental tenets we respectfully suggest should form the topics of your deliberations. Details must be entrusted to representatives from various geographical areas and differing conditions of medical practice.

5. **Recommendations of the Council.** — The Council, therefore, recommends that this House of Delegates instruct it to take the necessary actions to create and put into operation an organization of the form of, and containing all of the essential provisions embodied in, the tentative drafts of articles of incorporation, by-laws, etc., for the nonprofit membership corporation submitted as part of this report.

Respectfully submitted,
The Council of the California Medical Association.
Karl L. Schaupp, *Chairman.*
George H. Kress, *Secretary.*

ENABLING RESOLUTIONS FOR THE MEDICAL SERVICE PLANS OF THE CALIFORNIA MEDICAL ASSOCIATION

These resolutions, with legends A, B, and C, for reference convenience, appear in the minutes of the Council, under Item 14. (See page 40, second column.)

The resolutions were adopted by the House of Delegates. As stated in the editorial comment, the report of the proceedings of the House of Delegates will appear in the February issue of California and Western Medicine.

COUNCIL OF THE CALIFORNIA MEDICAL ASSOCIATION

Minutes of the Two Hundred and Sixty-Ninth Meeting of the Council of the California Medical Association

Meeting was held in the Auditorium of the Los Angeles County Medical Association, 1925 Wilshire Boulevard, Los Angeles, at 9:45 a. m., Friday, December 16, 1938.

1. **Call to Order.**—The meeting was called to order by Chairman Schaupp, with the following members present: President William W. Roblee, President-Elect Charles A. Dukes, Past-President Howard Morrow, Speaker Lowell S. Goin, Chairman of Council Karl L. Schaupp; Councilors Calvert L. Emmons, Louis A. Packard, Axcel Anderson, Alfred L. Phillips, Oliver D. Hamlin, P. K. Gilman, F. N. Scatena, Henry S. Rogers, Junius B. Harris, W. H. Kiger; Chairman of Public Relations Committee George G. Reinle, Secretary-Editor George H. Kress, General Counsel Hartley F. Peart and his associate, Mr. Howard Hassard.

Absent: C. O. Tanner, abroad; Carl R. Howson, illness; T. Henshaw Kelly; and Harry H. Wilson, illness.

2. **Minutes.**—The minutes of the two hundred and sixty-eighth meeting of the Council were presented and on motion of Charles Dukes, seconded by Howard Morrow, were approved.

3. **Illness of Doctors Howson and Wilson.** — The Secretary reported on the illnesses of Doctors Howson and Wilson.

It was moved by Axcel Anderson, seconded by J. B. Harris, that the Secretary extend to Doctors Howson and Wilson the sympathy of the Council. Carried.

4. **Loan to Association.**—The Secretary reported that in order to meet the current expenses of the Association,

incident to the special session of the House of Delegates and other needs, it had been necessary to borrow from the Trustees Of The California Medical Association an additional $5,000. It was stated that it was necessary that the action taken by the officers of the Trustees Of The California Medical Association in making, executing, and delivering a promissory note dated December 13, 1938, to the bank lending the additional $5,000 receive the approval of the Board of Directors of the Trustees Of The California Medical Association.

5. **Recess of Council.**—At this point a recess of the Council was declared to permit a meeting of the Trustees Of The California Medical Association.

6. **Call to Order.**—After the recess Chairman Schaupp called the meeting of the Council to order.

7. **Loan.**—Concerning the report of the emergency loan, previously discussed, on motion of George Reinle, seconded by Axcel Anderson, the action of the Chairman of the Council, the Chairman of the Auditing Committee and the Association Secretary-Treasurer, in arranging an additional loan of $5,000 from the Trustees Of The California Medical Association, was approved; and authority was given to borrow an additional $5,000 from the Trustees Of The California Medical Association, should necessity arise therefor. It was agreed that these loans from the Trustees should be repaid early in 1939, after the dues for the next year had been received.

8. **Publicity Committee.**—The desirability of appointing a committee to handle publicity was discussed. The names of various publicity men were presented.

It was moved by Charles A. Dukes, seconded by A. E. Anderson, that a special committee be appointed to handle publicity under instructions from the President of the Association. Carried.

It was agreed that the Special Committee on Medical Service Plans (Doctors Dukes, Kelly, and Goin) should act in such capacity.

Doctor Harris voted in the negative.

9. **Retired Membership.**—The Alameda County Medical Association having recommended for retired membership Dr. H. J. Kohlmoos, who had retired from practice, it was moved by Charles A. Dukes, seconded by William W. Roblee, that H. J. Kohlmoos be granted retired membership in the California Medical Association. Carried.

10. **Clarence G. Toland.**—It was moved by President Roblee, seconded by F. N. Scatena, that the courtesy of attendance at the Council meeting be extended to Clarence G. Toland, former president. Carried.

11. **Medical Service Plan.**—At this point, at the request of President Roblee, Council Chairman Schaupp stated that the Council would now pass on those items on the business docket pertaining to the proposed medical service plan.

Charles A. Dukes, Chairman of the Special Committee on Medical Service Plans, then submitted to the Council the report of the Special Committee's work subsequent to the last Council meeting held on November 12, 1938, and, in addition, submitted to the Council drafts of seventeen documents comprising two progress reports to the members of the House of Delegates dated November 26, 1938, and December 12, 1938, respectively, a preliminary and a final report of the Legal Counsel discussing in detail the legal problems connected with a medical service plan, four formal written opinions of the Legal Counsel covering the major legal questions involved, and articles of incorporation, by-laws, rules and regulations and membership certificates of two alternative types of organization, namely, nonprofit membership medical service corporation, and mutual chapter 9 insurance corporation.

Each of the documents submitted by the Special Committee on Medical Service Plans was then read in full to the Council and careful consideration and discussion was had concerning a number of the principles and points presented in the Committee's reports and in the reports, opinions and drafts of documents presented by the Legal Counsel. Mr. Peart and Mr. Hassard discussed each of the legal questions presented in their reports and written opinions, and Charles A. Dukes and Lowell S. Goin, on behalf of the Special Committee, presented and discussed the various considerations which have led the Committee to the conclusions contained in its report to the Council.

12. **Recess.**—At this point a recess of the Council was declared for luncheon.

13. **Delegates' Expenses.**—Discussion was had of the payment of expenses of delegates attending the special session of the House of Delegates.

In accordance with past procedure, the payment of round-trip railroad fare and lower berth for each delegate was approved.

It was moved by Charles A. Dukes, seconded by Lowell S. Goin, that delegates attending the special session of the House of Delegates be allowed a per diem of $5 for the two-day session. Carried.

14. **Medical Service Plan.**—At this point consideration was given to the Special Committee's report on tentative drafts of the Articles of Incorporation; By-Laws, and Rules and Regulations for a medical service plan.

The Secretary asked for instructions on distribution of the report of the Council to the House of Delegates.

On motion of Howard Morrow, seconded by F. N. Scatena, the report was ordered mimeographed in sufficient number for distribution to the members of the House of Delegates.

The Special Committee on Medical Service Plans and the Legal Counsel then presented to the Council a preliminary draft of a proposed report from the Council to the House of Delegates. The preliminary draft was read to the Council and then revised in certain particulars suggested by the councilors present.

It was moved by Lowell S. Goin, seconded by George Reinle, that the report of the Council as submitted by the Special Committee and as revised, be presented to the House of Delegates as the Council's report. Carried.

The following resolutions were then presented for the consideration of the Council:

Resolution A

Resolved, That the House of Delegates of the California Medical Association, in special session assembled at Los Angeles, California, this seventeenth day of December, 1938, favors the formation of an organization for the prepayment of or pooling funds for health service and care and for the establishment of a state-wide system of medical service and hospital care.

Resolution B

Resolved, That the House of Delegates of the California Medical Association, in special session assembled at Los Angeles, California, this seventeenth day of December, 1938, exercising its powers under the constitution of this Association—California Medical Association—does hereby authorize, direct and empower the Council of this Association forthwith to cause to be created, fully organized and embarked upon its activities, a California nonprofit corporation which shall have power to undertake a state-wide voluntary medical service plan and shall, in fundamental principles, conform to the proposed plan submitted to the House of Delegates by the Council at this special session.

Resolution C

Resolved, That the House of Delegates of the California Medical Association, in special session assembled at Los Angeles, California, this seventeenth day of December, 1938, hereby authorizes, empowers and directs the Council of this Association—California Medical Association—to lend or advance, upon such terms as it deems desirable, to any nonprofit medical service corporation caused to be formed by it, such sum or sums from the funds of the Association up to a maximum of $15,000 as it deems necessary or expedient; and be it

Further Resolved, That the Council is hereby requested to approve this resolution as required by Section 1 of Article XI of the Constitution of this Association.

It was moved by William W. Roblee, seconded by J. B. Harris, that the three foregoing resolutions be presented to the House of Delegates. Carried.

15. **Order of Business.**—After discussion it was agreed that the House of Delegates would convene at 9:30 a. m. on Saturday, December 17, 1938, with suggested order of business somewhat as follows:

Report of the Credentials Committee; Announcement of the Reference Committees; Address of the President; Explanation of the social and economic and political desirability of a medical service plan by Doctors Kelly and Harris; Report of Council; Recess for luncheon; Reconvening at 2 p. m. The House then to resolve itself into a Committee of a Whole for consideration of medical service plans; with hearing of the reports of the Reference Committees, and formal voting to take place after such consideration, on Sunday, December 18.

16. **Principles of Medical Ethics.**—President William W. Roblee presented a proposed amendment to the by-laws dealing with the principles of medical ethics. The proposed amendment would govern the solicitation of beneficiary members by any nonprofit organization defraying the cost of medical service under a plan approved by the California Medical Association, or any constituent county society.

It was moved by William Roblee, seconded by J. B. Harris, that the amendment to the Principles of Medical Ethics be submitted to the House of Delegates. Carried.

17. **Reference Committees.**—Speaker Goin stated that he had named as members of the Reference Committees the following:

Reference Committee No. 1

(For Consideration of Medical Service Plans)

P. K. Gilman, Chairman, San Francisco; S. J. McClendon, San Diego; F. R. Makinson, Oakland.

Advisory members: John C. Ruddock, Los Angeles; Roy A. Terry, Long Beach.

Reference Committee No. 2

(For Consideration of Matters Ancillary to Medical Service Plans)

C. Kelly Canelo, Chairman, San Jose; Bon Adams, Riverside; F. A. MacDonald, Sacramento.

Advisory members: G. W. Walker, Fresno; Gertrude Moore, Oakland.

Credentials Committee

T. D. Caruso, Los Angeles, Chairman; Mast Wolfsohn, Monterey; Dexter Ball, Orange.

18. **Recess.**—At this point the Council recessed to meet at the call of the Chairman.

19. **Call to Order.**—The meeting was called to order in the Barlow Medical Library of the Los Angeles County Medical Association, Los Angeles, California, Saturday, December 17, at 5 p. m., with the following members present: President Roblee, President-Elect Dukes; Councilors Schaupp, Emmons, Goin, Packard, Anderson, Phillips, Hamlin, Scatena, Harris, Rogers, Kiger, and Kelly; Chairman of Public Relations Committee Reinle, Secretary-Treasurer-Editor George H. Kress. R. G. Leland of Chicago, by invitation.

Absent: Doctors Gilman, attending Reference Committee meeting; C. O. Tanner, abroad; Carl R. Howson, illness; Harry H. Wilson, illness. Mr. Peart and Hassard attending Reference Committee meetings.

20. **Membership.**—The Association Secretary presented a letter from a County Society concerning one of its members whose license had been revoked by the Board of Medical Examiners of the State of California. The advice of the Legal Counsel was ordered to be followed.

21. **Residency Requirement.**—In discussion of the residency requirement for physicians who applied for membership in the California Medical Association on the basis of transfers from other state associations, it was the consensus of opinion that the six months' residency requirement as provided in the by-laws, before membership was granted, must be observed by component county societies.

22. **Social Security.**—The Secretary reported that a mandatory payment of $57.88 had been made to the collector of Internal Revenue on the Federal Social Security Act, and stated that one-half the amount or $28.94 should be collected from employees. The Secretary was instructed to collect the proper pro rata from each employee.

23. **Nursing Practice Act.**—Discussion was had of the proposed bill to establish a separate examining board for nurses, who now receive their licensure certificates from the California State Board of Public Health.

It was moved by Lowell S. Goin, seconded by Charles A. Dukes, that discussion of the nurses bill be indefinitely postponed.

In voting there was a division, with 8 ayes and 3 nayes. Doctors Harris, Kelly and Roblee voting in the negative.

24. **Southern California Society for the Control of Syphilis and Gonorrhea.**—The Secretary reported that Mrs. Hafford of the Southern California Society for the Control of Syphilis and Gonorrhea has presented a progress report on the proposed antivenereal legislation. No action taken.

25. **Humane Pound Act.**—The Secretary reported that a letter of appreciation of the activities of the California Society for the Promotion of Medical Research and the Association had been received from Doctor West.

26. **Social Well-Being.**—A letter was read from Joseph Mussatti regarding membership of Doctor Kress on the Republican Committee on Social Well-Being. In accordance with the policy of the Association, the Secretary was instructed to decline the appointment.

27. **Liquors.**—It was the sense of the Council that advertisements for wines and liquors be not solicited by CALIFORNIA AND WESTERN MEDICINE.

28. **Advertising Rates.** — The Council approved the present schedule of advertising rates for special space in the JOURNAL, as outlined by the Secretary.

29. **American Medical Association Survey.**—The Secretary presented a letter from the San Francisco County Medical Society stating that the Society could not undertake the tremendous task of compiling data for the American Medical Association Survey at this time.

30. **Farm Bureau.**—Doctors Rogers and Packard reported on the conference held with the Farm Bureau representatives on November 19. Both Doctors Packard and Rogers spoke of the desirability of another meeting with the Farm Bureau. It was felt that any proposed legislation should be referred to the Legislative Committee.

It was moved by T. Henshaw Kelly, seconded by C. A. Dukes, that the Committee continue its activities and report back to the Council or Executive Committee.

It was the sense of the Council that if further conferences were necessary in the judgment of the Committee, they should be held.

31. **R. G. Leland.**—R. G. Leland, Director of the Bureau of Medical Economics, spoke to the Council on medical service plans and offered the coöperation of the American Medical Association in the problems of the Association.

32. **Adjournment.**—There being no further business the meeting adjourned.

GEORGE H. KRESS, *Secretary.*

Attest:

KARL L. SCHAUPP, *Chairman.*

PRESS ITEMS CONCERNING SPECIAL SESSION OF HOUSE OF DELEGATES AT LOS ANGELES *

Some editorial comments:

The Doctors' Christmas Gift †

The California Medical Association has made the state a worth-while Christmas present through the action of its House of Delegates approving an all-California system of medical insurance. At the same time the doctors probably have done themselves and their profession a service by a step calculated to head off the incursion of "state medicine" in this commonwealth.

Most people, believing that government-financed medical insurance is still in the stage of debate, will be surprised to know that one federal agency has, on its own initiative, established the system in some twenty states. The Farm Security Administration—formerly Rex Tugwell's Resettlement Administration—is now financing as an adjunct to farm aid what amounts to state medicine for more than 100,000 families. In the Dakotas, where the movement has attained its greatest scope, about 77,000 Federal Security Administration clients receive medical, surgical, and dental care, with all necessary hospitalization, on an insurance system for which the Administration pays $2 a month per head. Altogether about three thousand country doctors are enlisted and get 51 per cent of the money, hospitals 37 per cent, dentists 8 and druggists 4, according to an article by Samuel Lubell and Walter Everett in a recent issue of the *Saturday Evening Post.*

The immediate difference between state medicine as so practiced and the medical insurance plan which is being pioneered by the doctors and hospitals in California is that in the former the cost is defrayed in whole or large part by the Government, and in the latter by the individual beneficiaries themselves. Actually, the difference is that between political paternalism on the one hand, and independent self-help on the other. State medicine is another extension of remote-control "relief" under which large groups of voters are made beholden to a centralized government; privately administered medical insurance is the application of actuarial principles to bring within the reach of the most modest private purse heretofore costly medical and hospital care. The one is open to all the political abuses and chiseling which have made Government relief a national scandal; the other, while yet to be tried on a large scale, is at least an intelligent effort to help the poor to help themselves. The first would turn the Hippocratic profession into another tax-financed Government bureau; the second would extend its benefits to everyone without the taint of politics or charity.

The California plan wisely proposes to benefit first those most in need of low-cost care and hospitalization. It is hoped to make these available to the small-income groups at not more than $2.50 per month for individuals and not more than $6 for families, regardless of size. If all the California Medical Association members and all the hospitals which have so far entered insurance groups subscribe to the plan, as is expected, those insured will have their choice of doctors and of hospitals as well. In all, the plan is expected, within three months, to make the services of some six thousand physicians and surgeons and several hundred hospitals available to perhaps one million persons to whom such care has heretofore been wholly or largely unattainable by reason of its cost.

An enormous amount of detail remains to be worked out, but the majority favor which the plan enjoys among the doctors themselves is practical assurance of its successful launching.—Editorial, Los Angeles *Times,* December 20, 1938.

* * *

Health Insurance

Would you pay $2.50 to $2.65 a month, like insurance, in order to have your doctor and hospital bills already taken of when you become ill or must have an operation? You may receive such an offer within a few months from California's medical profession. So you might as well begin thinking about what it means to you, personally, that the California Medical Association's House of Delegates has voted 9 to 1 to establish low-cost health insurance.

Our doctors have taken a great forward step.

Here is to be a voluntary system, making available the services of some of the best physicians, surgeons, and hospitals in the state to the small salary or wage-earner. The goal is to set up reserve funds through monthly payments so that when a major illness strikes it will not take a wage-earner's last cent, run him into debt and prove a harrowing burden. Insured persons will have their choice of the physicians and hospitals joining the plan.

* * *

The California program, if carried out in the purposeful manner promised by the Medical Association, will not be a mere gesture to head off Government socialized medicine or compulsory health insurance controlled by laymen and politicians.

A method of distributing the high cost of illness has been bound to come. Alert doctors see the trend. The profession declares the doctors, not outsiders, should run health services. We hope that the doctors themselves do meet the needs of the people.

Medical men have their biggest tasks ahead in the next few months when they will work out the details and offer the new health insurance to thousands of Californians. They can't just set up the plan and let it go at that. The idea must be sold.

Labor unions, other employees and employers as well should give attention to the plan. They could be of great service to the Medical Association in putting the far-reaching program in operation.—San Francisco *News,* December 20, 1938.

* * *

Medical Care Plan

California, which has traditionally led the nation in many progressive measures, such as the initiative, referendum, recall—to mention only a few—again leads with what may be the beginning of a new health era.

Seven thousand California medical men, through their representatives in convention, overwhelmingly adopted a program of state-wide health insurance.

In an editorial at the time the subject of "state medicine" was being discussed here before the American Medical Association, this newspaper pointed out that the wise measure would be a voluntary step in the direction of care for those in the lower income brackets, rather than wait for national or state legislation.

* * *

And that's why this step of the California medical men is so important: because it was voluntary and a real effort by the doctors themselves to solve the problem.

This problem, simply stated, is merely to insure at low cost for those who have incomes under $2,500 a year (or some comparable figure) an ability to have medical and hospital aid.

Much illness, and much final desperate surgery, can be avoided and the ailment successfully treated easily and rapidly and inexpensively if treated in formative stages.

But in the lower-income brackets, persons themselves ill or having ill dependents often "let it go" in the hope of saving expense—whereas, in fact, the expense may eventually be much greater, often greater than can be borne, in cases where the ailment is not immediately attended to.

* * *

By the physicians' new plan, for a very small sum, indeed, such persons would have a guarantee of the best treatment possible by the doctor of their own choice, as well as hospitalization.

The plan has been worked out carefully, but there are yet details to be polished.

That the plan may work is everyone's ardent wish, both from the point of view of the patient and the physician, as well.—San Francisco *Call-Bulletin,* December 20, 1938.

* * *

Medical Trail Blazing

From what we hear about its recently announced plan, the California Medical Association is going to blaze an entirely new trail in health insurance in the United States.

The meeting in Los Angeles of the Association's House of Delegates not only adopted recommendations of its Special Committee on Health Insurance, thereby paving the way for early beginning of this service throughout the state, but also approved two other steps that are decided innovations.

One is a proposal that the Association create a commission whose function will be to examine private health insurance plans (there are a number operating in the state now) and issue certificates of approval to those that meet certain standards to be set up by the Association. Examination, of course, would be only upon application by any private company. There would be no compulsion, and the commission would have nothing to offer except endorsement of the medical profession and the prestige such endorsement would give. By this means the medical fraternity would avoid implications of monopoly in the health insurance field.

---

* Note: The press comments of editorial and other nature which appear in this column, refer to the special session of the California Medical Association House of Delegates, held in Los Angeles, December 17-18, 1938. Their perusal will permit members of the California Medical Association who were not in attendance, to visualize somewhat the immediate reaction of the press representatives who were present, as well as the reaction of editors of newspapers from different sections. In the February issue of CALIFORNIA AND WESTERN MEDICINE it is planned to present more definite information concerning the details of the California Medical Association medical service plans.—K.

† See also cartoons under similar title, from the San Francisco *News,* in this issue, on pages 78 and 79.

* * *

The other new idea, advanced by the Santa Clara County delegation to the House of Delegates and adopted at the convention, is a proposal that the state set up a subsidy plan similar to that of Palo Alto, whereby all permanent residents of the community are allowed $2.50 a day, for a limited time, upon their hospital bills in the Palo Alto Hospital, the money coming from the city treasury. The doctors believe they can show the state and its political subdivisions will save money by such a plan and that ultimately it will do away with the need for county hospitals in all but the larger centers of population, when operated in conjunction with the proposed health insurance plan.

·For instance, they suggest the state might insure all its indigents as a group, thereby guaranteeing adequate medical care and thus effectively safeguarding the public health.

* * *

These ideas are long steps along the road of progress in the realm of coöperative medicine. The *News* for years has advocated that the medical profession itself accept the responsibility of establishing a state-wide health insurance system. That, after many years of delay, it now is undertaking the job is a credit to the Association and, we hope, will prove to be another mark of the progressivism that is typical of California.—San Francisco *News*, December 26, 1938.

What reporters wrote concerning special session:

Doctors Offer Low Cost Hospital-Medical Plan on Pari-Mutuel Basis

Los Angeles, November 18.—(UP).—America's first extensive medical service plan to provide doctor and hospital care at low costs to a majority of wage earners and their families was outlined today by leaders who will submit it to the California Medical Association next month.

Representing six years of study and research, the plan was explained in detail for the first time to two thousand members of the Los Angeles County Medical Association by Dr. Lowell S. Goin, speaker of the California Medical Association's ruling House of Delegates and chairman of the county and state committees in charge of the program.

The plan, anxiously awaited by the American Medical Association, which traditionally has opposed all such theories, provides in effect a "pari-mutuel" system of fees to coöperating physicians and unlimited medical service and limited hospitalization to subscribing families at a maximum cost of $72 a year. The program, if approved December 17 by the House of Delegates, will be binding upon all county medical units in the state. Professional membership is optional, but in the view of leaders, the implied penalty of loss of patients to noncoöperating physicians would make membership virtually mandatory.

Details of Plan

Subject to modification, the plan stacks up as follows:

Eligible to subscribe to the service would be all workers earning under $2,500 a year. Costs would start at $2.65 a month for the individual and increase by $1.00 for each additional dependent up to a maximum of $6.00 for the family, regardless of its size. Dependents would be defined on the same basis that the government defines them for income tax purposes. Patients are free to select their own doctor and hospital.

Subscribers would be guaranteed medical care and hospitalization for all maladies excepting insanity and mental diseases, acute alcoholism, narcotic addiction, and tuberculosis of the kind where sanitarium treatment is required. Broadly speaking, the profession regards these exceptions as cases for state or federal supervision. The service would allow treatment for venereal diseases, but hospitalization for cancer sufferers and those with similar malignant diseases would be restricted to operative and therapeutic treatment.

Hospitalization Limited

In all cases, hospitalization would be limited to three weeks per person per year. The average operative case requires only twelve days. Service privileges would apply at once, except for maternity patients, who must have been subscribers for a year.

Coöperating physicians and surgeons would be paid on a basis of "units," the value of which would be determined quarterly by the Board of Trustees, the administrative body. A tentative schedule suggested as "unit" fees: Five units for complete physical examination, 10 for confinement cases, excluding delivery; 1 for office visits, 20 for appendectomies; 2 for x-rays, etc.

Each doctor would compute his total units and present his bill to the Board of Trustees, which would pay him in cash from the general "pool." The value of the unit would necessarily fluctuate in accordance with the amount of cash left in the pool, after hospital and administrative costs are first deducted. Thus, if $2,000 were left in the pool to redeem 4,000 units, each unit would be worth 50 cents in the same manner that pari-mutuel payoffs are determined.

Plan Still Inperfect

Conceding that the plan is by no means perfect, Doctor Goin emphasized the committee would make no recommendations, leaving the question of adoption entirely up to the general profession. Many of the provisions will be changed and it is possible that a lower rate may be offered lower income groups, he said.

Committee members deny the project is designed to forestall socialized medicine and insist it was undertaken primarily to afford greater health opportunities to the public. Individual physicians, however, profess concern over the possibility of government intervention, objecting chiefly to the risks of dictation and to excessive administration costs. In England, the administrative costs were said to run between 40 and 60 per cent, leaving little for the physician and hospital.—Hanford *Journal*, November 19, 1938.

* * *

State Medical Body Plans for Care and Hospital Service System

With a view to heading off, if possible, socialized medical and hospital care by the state and also of meeting the federal government's move against the so-called medical trust, the council of the California Medical Association is planning a system for adoption and execution by the general association.

It provides for care and hospital service on monthly payments and will be buttressed upon a form of insurance that will make it easy and cheaper for that class of citizens which is not able to stand expensive hospitalization under physician's care. Taking Time by the forelock in such a venture marks an advanced step by the medical profession. It is intended to effectuate greater health in the state at a minimum cost.

The medical association has long anticipated the growing demand of state medicine and hospitalization. Opposition to it not only in California but elsewhere in the nation has not been successful in halting the movements. And since it is apparent such socialization is coming, the medical men here and in other states have been trying to work out a system that will meet the public demands and that will furnish, possibly, a basis for a national plan. Whether this can be done remains to be seen.

The medical association of the state must be given credit for the movement started in good faith. It is in the right direction.—Tulare *Advance-Register*, November 24, 1938.

California Doctors Map Insurance Plan

Monthly Pay Medical Treatment Favored

San Francisco, November 27—(AP). — First concrete steps toward establishment of medical insurance for all Californians on a monthly payment basis were taken here today when a special committee of the State Medical Association announced principles to be recommended for the project.

The committee, appainted to outline the medical service plan and submit it to the Medical Association's House of Delegates for final action at a Los Angeles meeting December 17, said it had agreed upon the following points:

1. The organization must function on a nonprofit basis.
2. All doctors must be given opportunity to participate.
3. All patients must have complete freedom to choose their doctor and their hospital.
4. The scope of medical service to be offered must be "as broad as possible." — Memphis, Tennessee, *Commercial-Appeal*, November 28, 1938.

State Medical Plan Is Proof of United States Trend

California Proposal Is Type Opposed by American Medical Association, Urged by Government

Cleveland, November 29.—The action of the California Medical Association in taking under consideration a plan to provide doctor and hospital care through voluntary insurance to workers earning less than $2,500 per year is graphic proof that widespread changes are on their way in the economic side of American medical practice.

Ultraconservative spokesmen of the American Medical Association have blasted away at the plans of the Federal Government to do something about the medical problems of the low-income groups in America. They have maintained existing methods and facilities are adequate.

However, it has been becoming increasingly evident that the rank and file of medical men in America did not agree.

The action of the California medicos is the most spectacular demonstration of that fact.

American Medical Association Battles Plan

By voluntary action, the California plan would bring about exactly the kind of situation against which the American Medical Association leaders have been battling.

Briefly, the plan provides that any worker earning less than $2,500 a year would pay $2.65 per month, entitling him to all medical care needed with the exception of certain conditions already provided for by state institutions, a maximum of twenty-one days hospitalization. Members of his family could be brought under the plan by an additional payment of $1.00 per member or a maximum of $6.00 per month.

Cleveland's Plan

It is interesting to compare this California plan with what is being done elsewhere. The most successful hospitalization plan is now in operation in Cleveland and has 145,000 subscribers.

This provides a maximum hospitalization of three weeks on the following system of payments from an individual cost of 60 cents per month to an entire family cost of $1.90.

The Cleveland Academy of Medicine is now studying a plan which would offer coverage of doctor bills for illnesses requiring hospitalization.

United States Likely to Approve

It seems entirely probable that the Federal Government will welcome the California experiment.

Speaking before the City Club in Cleveland, Dr. Warren F. Draper, executive officer of the United States Public Health Service, emphasized the fact that the Federal Government had no one plan for the entire nation and no desire to force any plan upon the states.

He said it was desirable for each state to work out its own plan so that local conditions might be met and so that the nation might learn by experience the desirable or undesirable features of any given plan.—By David Dietz, Scripps-Howard Science Editor, San Francisco *News*, November 29, 1938.

California Medical Association Council Gets Health Plan Report

Special to The Chronicle

Los Angeles, December 16.—The Council of the California Medical Association in executive session today completed its report on the controversial issue of health insurance.

Tomorrow the medical group's House of Delegates, acting with final authority of organized medicine, will decide on the new system.

No definite plan for health insurance has yet been set, doctors' spokesmen said.

The California Medical Association Council last month authorized a special committee to gather all available data. This report was presented today by Dr. Charles A. Dukes of Oakland, president-elect of the Association, and chairman of the special committee.

Fees Discussed

Doctor Dukes denied that costs and fees have been scheduled. He said that while the figure of $2.50 per month had been discussed as approximate cost of medical and hospital service, neither this amount nor the plan itself has yet been approved.

Other medical leaders explained that the principle of insuring against costs of illness is supported by numerous doctors, as witnessed by their organized sponsorship and personal membership in nonprofit hospitalization funds, such as the Bay Region's Insurance Association of Approved Hospitals.

In the face of reported San Francisco controversy over the whole issue, Northern doctors said they were in agreement on the basic idea of health insurance and were confident that details could be worked out.

Los Angeles Going Ahead

Executives of the Los Angeles County Medical Society meanwhile let it be known that they are "going ahead with health insurance."

The southern group has already adopted a plan which will be put into effect locally if the state body fails to agree, Los Angeles doctors said.

Saturday's session of the House of Delegates will be presided over by Dr. W. W. Roblee of Riverside.—San Francisco *Chronicle*, December 17, 1938.

* * *

Socialized Medicine Plan Drafted

Los Angeles, December 17—(AP).—Socialized medicine costing $6.00 a month per family, regardless of size, was recommended today to the California Medical Association's House of Delegates by a special committee appointed to study the plan.

The plan as outlined by Dr. C. A. Dukes of Oakland, chairman of the committee, would be under control of the State Medical Association, and administered by a corporation.

Howard S. Hassard of San Francisco told the Board any other plan of administration would mean a partnership involving individual responsibility and possible liability to Federal and State income taxes.

Pooling of Funds

Doctor Dukes' committee reported membership of the Association desires to put into actual operation a system of prepayment medical service and hospital care through the pooling of funds.

While the exact cost was not figured, the committee's estimate was $2.50 for each participant, with the cost lower if 500,000 persons participated.

One suggestion was for a charge of $2.65 monthly per person. This would increase $1.00 monthly for each dependent and allow medical, surgical and hospital treatment in emergencies for a $6.00 monthly fee for an entire family, regardless of its size.

Under the plan the patient would be at liberty to select his physician and hospital.

The committee reported the plan should be worked out by the doctors of California as a whole, rather than by those of any particular locality. It reported that the medical profession should "evolve, formulate and control any plan for the establishment of such service," that it be operated on a nonprofit basis and that all doctors of medicine be eligible to render the service.

Report Quoted

"This Association can authorize the formation of a proper organization to provide medical and hospital service on a prepayment basis and at the same time preserve all the necessary and indispensable safeguards for the protection of the patient and the doctor," said the report.

Doctors would be reimbursed on a "unit basis," all prepayments being pooled and the doctor paid according to the unit scale, grauating from treatment for minor ailments to major operations. The committee disapproved a suggestion that the medical association enter into an agreement with an insurance company to carry out the plan, protesting it "would inevitably subject the profession to the domination of business capital."

Associated with Doctor Dukes in formulating the tentative plan were Dr. T. Henshaw Kelly of San Francisco and Dr. L. S. Goin of Los Angeles.

Warning Sounded

Dr. William W. Roblee of Riverside, president of the California Medical Association, warned that if the Association did not take up the matter of health insurance and evolve a plan "it is likely some methods will be established by legislation."

"If our profession in California can show that sickness insurance can be worked out successfully, it may block undesirable features of legislation expected to be introduced in Congress," he said.

Doctor Roblee said that Governor-elect Culbert Olson had said through a spokesman that it was assumed California doctors were willing to do their part in furnishing medical insurance, but that if they did not, a program for insurance would be submitted for the California Legislature.—San Francisco *Chronicle*, December 18, 1938.

* * *

California Medical Aid Plan Outlined

Clinic Help at Cost Is Proposed

A large-scale plan to furnish medical service at cost, open to all the people of California and under control of the medical profession, was outlined today in a report to the House of Delegates of the California Medical Association by the Council of the Association.

Dr. C. A. Dukes of Oakland, chairman of a special committee, which prepared the report, said that the cost of the service had not been figured out exactly, but it was estimated that it would be around $2.50 a month per person. This would depend largely on how many persons took advantage of the service, he said.

May Get Family Rate

If as many as half a million persons become beneficiaries, he said, a lower rate could be established for families.

One suggestion was that a rate of $2.65 a month per person be established, increasing $1.00 for each dependent to a maximum of $6.00 per month for a family, regardless of size.

Beneficiaries under the plan would be entitled to complete medical, surgical and hospital treatment in case of necessity. They would be at liberty to select any doctor they preferred and, also, to select any hospital, if space were available in such hospitals.

Tax Problem

Doctor Dukes said that it was recommended that a corporation be formed to administer the plan, and Howard S. Hassard of San Francisco, attorney for the Association, said that any other plan of administration would mean a partnership involving individual responsibility. Hassard said that if the plan is successful it would mean a collection of millions of dollars annually and these receipts, under a partnership administration, might be held liable to federal and state income taxes.

Doctor Dukes said the question had also been raised as to whether the organization would be subject to the state insurance laws and to the registrations of the state insurance commissioner. Hassard said there was no court decision in California establishing a precedent in this connection.

Doctor Dukes said that the choice seemed to be between incorporating as a mutual insurance company, subject to the insurance commissioner, or incorporating as a nonprofit company under the jurisdiction of the state corporation commissioner.

About 150 doctors were present at the meeting of the House of Delegates at the County Medical Association Building at 1925 Wilshire Boulevard.

The report stated that the members of the Council "have become thoroughly convinced that the membership of the Association generally throughout the state desires to put into actual operation a state-wide system for the prepayment of medical service and hospital care through the pooling of funds therefor."

It was further stated in the report that the Council feels that the safest and most successful organization could be worked out by the doctors of the state as a whole and not by the doctors of any particular locality.

It was further stated that the Council felt that the medical profession should evolve, formulate and control any plan for the establishment of such a service.

Say Plan Practical

Reports of the Council, it was also stated, "show that this Association can authorize the formation of a proper organization to provide medical and hospital service on a prepayment basis and at the same time preserve all the necessary and indispensable safeguards for the protection of the patient and the doctor."

It was recommended that the service operate on a nonprofit basis, with all doctors of medicine eligible to render service.

The doctors would be reimbursed on a "unit basis." All prepayments would be pooled and when a doctor renders a service he would be paid according to the number of "units" he had rendered. This was explained as meaning that a treatment for a minor illness would constitute a single unit, with ascending scale of units for more serious illness or operation.

Board of Trustees

It was proposed that a board of trustees be created to put the plan into effect and that a medical director be appointed to administer it. Another proposition was that district administrative centers be developed.

The Council disapproved a suggestion that the medical profession enter into an agreement with a group insurance company or a single company to carry out the plan. The report stated that to enter into such an agreement "inevitably subjects the medical profession to the domination of business capital."

Associated with Doctor Dukes in the preparation of this report were Dr. T. Henshaw Kelly of San Francisco and Dr. L. S. Goin of Los Angeles and a speaker of the House of Delegates.

Dr. William W. Roblee of Riverside, president of the Association, explaining why the matter of health insurance had been taken up, declared that if the Medical Association did not work out a plan it was likely that some methods would be established by legislation.

Other Plans Under Way

"If our profession in California can show that sickness insurance can be successfully worked out it may block undesirable features of legislation expected to be introduced into Congress," he said.

Doctor Roblee also said that a spokesman for Governor-elect Culbert L. Olson had made the statement that it was assumed that the doctors were willing to do their part in furnishing medical insurance, but if they did not, a program for insurance would be submitted for the California Legislature.

"If organized medicine did not render this service to the people they will seek it elsewhere," he said.

He also stated that the Los Angeles County Medical Association has a plan for insurance under consideration which it will propose if the State Association fails to act.

The Council recommended that the House of Delegates instruct it to take necessary action to create and put the proposed plan into operation.—Los Angeles *Evening Herald*, December 17, 1938.

* * *

California Doctors Spur Plans to Provide Mass Medical Aid

The California State Medical Association today was preparing to launch within two or three months a history-making plan for state-wide voluntary health insurance and hospitalization. With an overwhelming vote, the Association's House of Delegates in a meeting here approved a plan to set up a nonprofit corporation, financed by the Association, to administer the momentous project for the six thousand-member physicians and expected million or more subscribers.

Financial details of the undertaking were left to a special committee, but unofficial estimates placed the cost of health insurance and hospitalization at approximately $2.50 per subscribing member per month, with a sliding scale providing lower fees for dependents in a family.

May Set Wage Limit

The plan probably will be limited to persons with incomes under $2,500 a year. The exact figure will be established by the corporation after careful study.

Admittedly the voluntary medical plan was approved to forestall threatened governmental control of the profession.

The plan will be sufficiently broad to include hospital, nursing and laboratory fees in addition to physicians' and surgeons' services.

Dr. William W. Roblee of Riverside, President of the California Medical Association, explained:

"There will be absolutely no change in the traditional and ethical relationships between doctors and clients that now exist.

"A member of the group who is ill will go to his regular family doctor, who is a professional member. If upon diagnosis he is discovered to have appendicitis, for instance, he will be taken to the hospital of his choice and operated on by his physician in the regular manner.

"The only difference is the doctor will collect his money from the corporation and the patient will have paid his fee automatically by his monthly insurance premiums."

The project will be for low income groups, but is not intended to handle indigent cases, it was pointed out.

The plan will not provide medical care for alcoholics, persons afflicted with mental diseases or narcotic addicts. Also excluded will be injuries now covered by the workmen's compensation law.

Compensation for physicians will be on the basis of "units," rated according to the type of service given. At the start the unit value will be set arbitrarily, $2.00 now being considered as the temporary value.

Plan members will select their own hospitals and doctors. Payments will be made similar to life insurance premiums, and will be arranged on a weekly, monthly or semimonthly basis.

The program was adopted by a nine-to-one vote after three days of heated discussion by the 150 delegates from every county in the state, meeting in the auditorium of the Los Angeles County Medical Association Building.

Historical Step

It was called "a forward step in medical history" by Dr. Charles A. Dukes of Oakland, president-elect of the Medical Association.

"The plan guarantees the best possible medical attention to the average person by placing the services of competent physicians within his means," he said.

The nonprofit corporation administering the health insurance plan will be governed by a board of nine members—five doctors, two hospital superintendents and two business men. Every county medical unit will be represented by one member in the corporation.

In adopting the program the Association struck at so-called "chiselers" in the field of health insurance by voting to set up a special committee to pass on other health insurance plans with power to forbid members to affiliate with disapproved plans.

Association spokesmen said they were not intending to injure "reputable" coöperative groups.

Membership of medical men in the plan is optional with each individual doctor.

Three types of membership in the corporation will be provided—beneficiary, professional and administrative. The "premium" paying customers will comprise the beneficiary members.

Professional members will consist of the physicians and surgeons who voluntarily join the plan. Administrative members to operate the state-wide program will be elected by the corporation trustees.

Hospital Systems

The Association will underwrite three nonprofit hospitalization systems now in operation in the state, according to Dr. Lowell S. Goin, speaker of the House of Delegates. These systems include the Insurance Association of Approved Hospitals in the San Francisco-Oakland district, the Associated Service of Southern California and the Intercoast Hospital Service of Sacramento, which are providing care to about fifty thousand members at approximately 3 cents a day.

Only doctors who hold a medical degree and "an outstanding and unrevoked physicians' and surgeons' certificate," issued by the State Medical Board, would be entitled to professional membership.

A resolution demanding a referendum of the Association's members on the plan was defeated during the lively discussions.

Dr. Louis A. Alesen challenged the need for any type of socialized medicine.

"Are you sufficiently naïve," he demanded, "to believe that if you pass some type of health insurance that these outside groups will be satisfied? Does the individual live to serve the state or the state to serve the individual?"—Los Angeles *Herald and Express*, December 19.

* * *

Medical Group to Operate Insurance System at Low Cost

By an overwhelming vote of its House of Delegates, the California State Medical Association yesterday ushered in a new era for medicine by adopting a plan for state-wide voluntary health insurance.

Unqualified indorsement given the program recommended by the Association's Council will make medical care available to low-income residents of the state "within two or three months" in return for small monthly premiums.

While financial details of the momentous project were left to a special committee, unofficial estimates placed the cost of the health insurance and hospitalization at approximately $2.50 for each member per month, with a sliding scale of lower fees for dependents in a family.

Will Affect Many

As an immediate result of yesterday's vote, machinery will be set in motion for establishment of a nonprofit corporation, financed by the Association, to "sell" and administer the project for the six thousand-member physicians and probable million or more subscribers.

Persons with incomes exceeding $2,500 per year will probably be barred from participation in the plan, although the official figure is to be set by the corporation after detailed study.

Passage of the revolutionary measures ended a stormy and heated two-day session of the 150 delegates, gathered from every county in the state in the auditorium of the Los Angeles County Medical Association Building.

San Francisco Proposal

Proposed by Dr. Karl Schaupp of San Francisco, Council president, and brought to the floor by Dr. P. K. Gilman, San Francisco, the principal enabling resolution read:

"Resolved, That the House of Delegates of the California Medical Association, in special session at Los Angeles . . . exercising its powers under the constitution of this Association, does hereby authorize, direct and empower the Council forthwith to cause to be created, fully organized and embarked upon its activities, a California nonprofit corporation, which shall have power to undertake a statewide voluntary medical service plan and shall, in fundamental principles, conform to the proposed plan submitted to the House of Delegates by the Council at this special session."

The approved and unparalleled voluntary medical setup was admittedly offered by the medical association to forestal threatened governmental control of the profession.

The plan is to be made broad enough to include hospital fees, nursing fees and laboratory charges as well as physicians' and surgeons' services.

Provides for Three Types of Membership

It provides for three types of membership in the corporation—beneficiary, professional and administrative. Beneficiary members will be the "premium-paying" customers.

Professional members will be the physicians and surgeons who voluntarily bind themselves to the plan and who will be paid out of a pool of subscription funds on the "unit" basis—with different medical treatments rated by units according to their complexity.

Administrative members will be elected by the corporation trustees and will operate the far-flung program.

"There will be absolutely no change in the traditional and ethical relationships between doctors and clients that now exist," Dr. William W. Roblee of Riverside, Association president, explained.

Example Reveals How Plan Will Work

"A member of the group who is ill will go to his regular family doctor who is a professional member. If upon diagnosis he is discovered to have appendicitis, for instance, he will be taken to the hospital of his choice, and operated on by his physician in the regular manner.

"The only difference is the doctor will collect his money from the corporation, and the patient will have paid his fee automatically by his monthly insurance premiums," he declared.

It was pointed out that the plan, when in effect, will be aimed at low-income groups, but will have nothing to do with indigent cases.

Three nonprofit hospitalization systems now in operation in the state will be underwritten by the Association, Dr. Lowell S. Goin, Speaker of the House of Delegates, declared.

These hospital prepayment insurance organizations are the Insurance Association of Approved Hospitals in the San Francisco-Oakland area, the Associated Hospital Service of Southern California, and the Intercoast Hospital Service of Sacramento, which are already supplying care at about 3 cents per day to approximately fifty thousand members.

"The scope of medical service is contemplated to include everything except industrial injuries, and accidents or illness arising from lawlessness, insanity, chronic alcoholism and drug addiction," the Council's report specified.

Regional directors will administer the insurance in various parts of the state, it continued, and only doctors who hold a medical degree and "an outstanding and unrevoked physicians' and surgeons' certificate," issued by the State Medical Board, would be eligible to professional membership.

Enrollment in the ranks of the California State Medical Association is not, however, compulsory for physicians who operate under the plan.

Socialized Medicine Need Challenged

Proponents and opponents of the revolutionary health insurance idea sparred verbally and heatedly throughout the morning.

While the delegates resolved themselves into a committee of the whole, the chairman, Doctor Roblee, opened the door to arguments.

After a lively battle, a resolution demanding a referendum of the Association's members before action of the House of Delegates was roundly defeated.

Hottest was the word tilt between Drs. Louis A. Alesen and Sam Ayres, Jr., of Los Angeles, in which Alesen challenged the need for any sort of socialized medicine.

"Are you sufficiently naïve to believe that if you pass some type of health insurance that these outside groups will be satisfied?" Doctor Alesen queried. "Does the individual live to serve the state or the state to serve the individual? That is the subject before the California Medical Association."

To which Doctor Ayres replied:

"When the patient says he is sick, you consult with other physicians on the matter. The public is that patient. It says, 'I'm sick' and we've got to find out what to do about it."

San Franciscans Favorable to Plan

Summing up the San Francisco opinion on the health insurance question, Dr. Alson E. Kilgore, surgeon, talked in favor of the plan.

He said: "Health insurance is coming, I am convinced, because of an underlying economic need that will not be denied. We have reached a point now where a large group in the community is not able to carry expenses of a major sickness."

An ominous warning was sounded by Dr. J. B. Harris of Sacramento, representative of the Medical Association at the state capital.

"The strains of the orchestra of the inaugural ball will hardly die away before there will be introduced in the Assembly the C. I. O. bill for compulsory health insurance in this state," he declared.

"We should have no delusion about what some of the legislators intend to do to us to break down our standards."

Another resolution unanimously passed provides for the establishment of a committee to serve other health insurance groups in the state and empowers the committee to pass upon the merits of such independent concerns.—Los Angeles *Examiner*, December 19.

* * *

California Medicos Okeh Easy Pay Plan

California's six thousand doctors today were firmly launched on a new "poor man" medical plan, foreshadowing a knockdown and drag out fight with present group medical practitioners.

The doctors, through the House of Delegates of the California Medical Association, gave unqualified endorsement to a plan that would bring the most expensive type of operation, treatment of disease and medical guidance to the poor man for a flat monthly fee probably to be set at $2.50 a month, for the individual, or $6.00 a month for a family.

A possible fight with smaller health insurance enterprises was foreshadowed when the Association unanimously voted to set up a special committee to pass on all other health insurance plans now in operation.

The committee was empowered to forbid members to affiliate with any plans of which it disapproved. This, of course, was aimed at "chiselers," not reputable groups, it was explained.

Designed not for the rich man, nor the indigent who is entitled to free treatment, but for the working man, the new tentative plan, which goes into effect within sixty to ninety days, would be open to wage earners with incomes less than $2,500.

Passage of the revolutionary measures ended a heated two-day session of the 150 delegates gathered from every county in the state in the Los Angeles County Medical Association Building.

California became the first state in the union to attempt to meet the challenge of "state medicine."

In many ways its plan was patterned along the lines of such a state plan, except that it will be under control of doctors from start to finish.

As authorized, the Association would set up a nonprofit corporation. Three types of members would be sought—professional (the physician and surgeons who voluntarily join), the beneficiaries (patient members), and administrative members (those elected by the corporation trustees, charged with operating the plan).

Regional directors will administer the insurance in various parts of the state, and only doctors who hold a medical degree and "an outstanding and unrevoked physicians and surgeons' certificate" would be eligible to professional membership.

The entire plan is predicated on the unit system of payment, which, it is hoped, will guarantee the nonprofit corporation from going broke.

Under its provisions, the total dues of all member patients would go into a common fund. Each doctor who treated a member, meanwhile would be credited with so many points, according to the complexity of the treatment. When month's end arrived, the number of units would be divided into the total dollars—and the doctors would be paid off.

Dr. Charles A. Dukes of San Francisco, Chairman of the California Medical Association's Council, urged adoption of the plan as the "best possible medical care for the average man and woman of this state."

He said the entire medical profession has shown its willingness to coöperate.

Dr. Alson Kilgore of San Francisco, said the "basic principle of this coöperative plan of medicine and hospital service is widely recognized.

"While to us this may be a radical step it is none the less coming because of the underlying economic need. No one of us can deny there are large groups in every section who are unable to carry the costs of illness."

An ominous warning came from Dr. J. B. Harris of Sacramento, representative of the Medical Association at the state capital:

"The strains of the orchestra of the inaugural ball will hardly die away before there will be introduced in the Assembly the C. I. O. bill for compulsory health insurance in this state," he said.

"We should have no delusion about what some of the legislators intend to do to us to break down our standards."—Los Angeles *Evening News*, December 19.

Medical Group Spurs Work on Insurance Plan

Lawyers Map Articles of Incorporation

The Council of the California State Medical Association proceeded promptly yesterday in its task of incorporating the organization which will administer the new state-wide plan of voluntary health insurance.

As the first step toward inauguration of a program making medical care available to low-income Californians on a small monthly premium basis, attorneys for the Association began work on articles of incorporation to be filed early next year.

The attorneys are: Hartley F. Peart, general counsel, and Howard Hassard, associate counsel.

Medical Approval

For their model the lawyers had an eleven-page tentative draft of incorporation articles approved by the Medical Association's House of Delegates at a meeting in Los Angeles Sunday.

Before the completed articles can be filed with the state government, corporation officers must be named. Dr. Karl L. Schaupp of San Francisco, President of the Association Council, yesterday said naming of these officers awaits an election by each of the nine councilor districts in the state. The election probably will be called when the Council meets here on January 14, he indicated.

Election Mapped

Association doctors in each councilor district will elect an administrative member to the health insurance plan corporation, and these members will, in turn, choose the trustees, who will direct actual operation of the program.

As local physicians returned from the Los Angeles meeting they were deluged with questions concerning operation of the plan—questions pertaining to eligibility, costs, kind of service and extent of treatment.

Doctor Schaupp and others met all such questions by pointing out that the Los Angeles meeting adopted merely the broad outlines of a plan and that details have not yet been worked out. Any questions pertaining to such details are premature, Doctor Schaupp said, and any answers to such questions are at present meaningless.

Finance Told

Dr. Charles A. Dukes of Oakland, president-elect of the State Medical Association and chairman of the special committee which drew the plan, however, declared that the new organization will be called the California Physicians' Service and will be financed, in the beginning, through a $5.00 assessment on each of the Association's six thousand members, plus a $15,000 loan from the Association.

Although reports from Los Angeles declared that the service, at first, will be limited to persons with annual income of less than $2,500, Doctor Dukes said:

"That question is far from decided. I am in favor of extending the service to include persons in the higher income brackets—those earning as much as $400 or $500 a month."

System Announced

At first, Doctor Dukes said, the plan will be opened only to "groups gainfully employed, such as the employees of reliable firms." Under these limitations, he said, the organization hopes to start out with 250,000 beneficiary members. Later, with virtually all limitations removed, 500,000 members are anticipated, he said.

Certain exceptions will probably be made in extending medical and hospital care, Doctor Dukes said, with no treatment for such ailments as mental diseases, venereal diseases, drug addiction, alcoholism, tuberculosis or injuries or diseases due to lawlessness or attempted suicide.

Doctor Dukes pointed out that the organization will be nonprofit, with doctors and hospitals receiving nominal fees.

"I hope and expect," he said, "that the monthly premium for an individual will be about $2.50."—San Francisco *Examiner*, December 20.

* * *

Health Plan May Go Into Effect March 1

Details of Physicians' Program Being Worked Out by Committee; State Council Will Act; Final Organization to Be Submitted for Approval January 14

Actual operation of the California Medical Association's health insurance plan may start as early as next March, Dr. Charles A. Dukes of Oakland, President-elect of the Association and chairman of the committee which prepared the plan for submission to the Association's House of Delegates, foresaw today.

"It will take about three months to work out the details, and the state-wide doctor and hospital service to individuals paying monthly premiums could go into effect by March if there are no legal entanglements," Doctor Dukes said. "We hope to have it under way before the Association's next meeting at Del Monte in May."

The many details filling in the broad outline approved by the Association's House of Delegates in Los Angeles last week-end are now being developed by the original committee that submitted the plan, headed by Doctor Dukes, and including Dr. T. Henshaw Kelly and Dr. Lowell S. Goin.

Council to Act January 14

The completed plan will be submitted to the Council of the Medical Association, meeting here January 14.

It will be the Council which will form the organization, probably to be known as the California Physicians' Service, and actually put the service into effect, first electing an Executive Committee under authority given it by the House of Delegates.

Then, Doctor Dukes said, probably at the May meeting of the Association, each of the nine councilor districts in the state will elect an administrative member to the Health Insurance Plan Corporation.

These, he said, would appoint an executive group of trustees to include five doctors, two hospital men and two businessmen.

Meanwhile, Hartley F. Peart and Howard Hassard, attorneys for the Association, are working on articles of incorporation to be filed with the state government.

Plan Is Explained

All these details, Doctor Dukes pointed out, are dependent upon decisions to be made by the Association's Council at its January meeting.

This is the way in which Doctor Dukes foresees the plan will work out:

Eligibles: Groups of gainfully employed persons, possibly limited to those whose annual income is $2,500 or less, possibly including those whose income is as high as $5,000.

Cost: A flat monthly premium of approximately $2.50.

Exceptions to medical and hospital care: Mental diseases, venereal diseases, drug addiction, alcoholism, injuries or diseases due to lawlessness or attempted suicide, pulmonary tuberculosis (except for diagnosis and three weeks' treatment), hospitalization for cancer (except for diagnosis, therapeutic operations, or acute emergencies).

Doctor Dukes said it was hoped the service would start with 250,000 beneficiary members, eventually gaining 500,000 beneficiary members, by which time certain regulations of the plan might be relaxed.

Not included in privileges of membership would be drugs, biological and endocrine products, spectacles, artificial limbs and braces.

Beneficiary members would be permitted to choose their own doctors, from among those who are members of the California Physicians' Service.—San Francisco *News*, December 20.

* * *

Fishbein Approves California Medical Association Health Plan

Chicago, December 18—(UP).—Dr. Morris Fishbein, editor of the *Journal of the American Medical Association*, said tonight that the California health insurance plan was in accordance with action taken by the American Medical Association's House of Delegates in Chicago last September.

"The delegates approved a plan for voluntary nonprofit cash indemnity insurance against the cost of sickness for people of the low-income group," Fishbein said.

"The California plan falls within this pattern."

He said he understood a similar plan was adopted by the Utah Medical Association last week and that health insurance also was being studied by the New York and Wisconsin state groups.—San Francisco *Chronicle*, December 19, 1938.

Health Plan Held Immune to Trust Laws

California Medical Leaders Confident Insurance Is "in Clear" on Federal Statutes

Aid for Needy—Provisions Eliminate Charge of "Closed Corporation"; Two New Features Revealed

California medical leaders were confident yesterday that the new health insurance plan just authorized by the State Medical Association is "in the clear" so far as federal anti-trust statutes are concerned.

The plan's provision that any physician holding a license to practice in California may participate in the insurance system, regardless of whether he is a member of the State Medical Association, is believed to dispose of any charges of "closed corporation" or discrimination .

The provision was expressly inserted in the proposed Association's by-laws to avert any such attack as the government is now making on the American Medical Association in Washington, D. C.

Two New Features

Examination of the new health service's by-laws yesterday disclosed two hitherto unrevealed features of the program:

1. A provision that monthly fees to be charged may vary, for the same medical and hospitalization service, according to the differing abilities of beneficiaries to pay.

2. Authorization to enter into contracts with the federal government, the state or any city or county for provision of medical and hospitalization service.

The provision for differing fees will enable the service to extend health insurance into the very lowest income brackets as the plan develops, in the opinion of analysts of the plan. The contract authorization will enable the service to extend service even to indigents, by arrangement with governmental authorities.

May Assume Service

Medical service now provided SRA clients and to migrants and farm workers through various federal agencies may be taken over by the State Association organization, under this authorization, the governmental agencies, responsible now for their care footing the bill.

Fixing the upper income limit beyond which persons may not be eligible to the insurance rests with the service's board of governors, still to be elected. Although $2,500 has been discussed, informed observers believe the limit will be set as high as $3,500 or $4,000 when finally determined in order to extend the benefits of the plan as widely as possible.—San Francisco *Examiner*, December 21.

Southern California Itinerary: Doctors Dukes, Roblee, Kress, and Councilors Anderson, Emmons, Howson and Packard. For Months of January and February, 1939

Date	Day	City of Meeting	County Society Host	Secretary Host Society	Councilor	Guest Speakers
January 5	Thursday	Stockton	San Joaquin	G. H. Rohrbacker	Anderson	Roblee Kress
16	Monday	Orange	Orange	Glenn Curtis	Emmons	Dukes Kress
17	Tuesday	Pasadena	Los Angeles	L. G. Craig	Howson	Dukes Kress
18	Wednesday	Riverside	Riverside	R. A. Card	Emmons	Dukes Kress
19	Thursday	Los Angeles	Los Angeles	G. D. Maner	Howson	Dukes Kress
20	Friday	San Diego	San Diego	W. H. Newman	Emmons	Dukes Kress
21	Saturday	Imperial	Imperial	W. A. Clarke	Emmons	Dukes Kress
22	Sunday	No meeting	....	....	....	....

February 16	Thursday	Bakersfield	Kern	C. S. Compton	Packard	Dukes Kress

C. M. A. DEPARTMENT OF PUBLIC RELATIONS[†]

MEDICAL AND SCIENTIFIC EXHIBITS AT THE GOLDEN GATE INTERNATIONAL EXPOSITION[*]

Had Hippocrates lived in 1939 he might have concluded, "And I will add to my own knowledge the findings of men of science and research."

On February 18 and 19, 1939, the World's Fair Première will give some 300,000 visitors an insight into the miracles of modern science and medicine. Officially, the premiere celebrates the construction of the two great bridges which span San Francisco Bay, the three great western power projects—Boulder, Grand Coulee, and Bonneville Dams—and the aerial "bridging" of the Pacific by the China Clipper. But man's equally miraculous achievements will be seen on Treasure Island itself by all who enter the huge Hall of Science.

There the vital and tenable results of thousands of hours of research and experiment will be on view. Illuminated dioramas, working models, robots, graphs, charts, and lectures will convey to Exposition visitors the wonders of modern scientific discoveries and their application. Every field of modern science will be represented: zoölogy, biology, chemistry, bacteriology, biochemistry, physics, etc. In the medical exhibits particular emphasis will be upon the prophylactic features of modern medicine.

Led by such famous institutions as the American Medical Association, the Mayo Clinic, and the American Dental Association, these exhibits will present a dramatic picture of the latest advances in medicine and related fields. In charge of the Hall of Science is Dr. Milton Silverman of the University of California.

Initial public demonstration of the remarkably effective antiserums for the thirty-two types of pneumococci will be made at the World's Fair Première. Specialists have predicted that the development and proper distribution of these curative agents will greatly diminish pneumonia mortality. With this demonstration the cause, spread, diagnosis, and treatment of the disease will be explained, as will the methods employed to determine the type of pneumococcus and the proper serum for its treatment.

Another exhibit will show human heart action by graphic light flashes in a gigantic model. The course of the blood stream will be shown; and the effects upon the heart of rest, of mild and severe exercise. Popular misconceptions of high blood pressure will be exposed and its prevention and treatment explained.

Part of the University of California's $300,000 exhibit will be a full-scale model of Dr. E. O. Lawrence's cyclotron. This enormous new weapon of medical science demonstrates the manner in which atomic structures are bombarded into their component parts. All details of construction have been faithfully reproduced. Instead of the invisible and deadly deuterons that whirl about the cyclotron vacuum chamber, steel balls will wind in slow spiral paths to represent their lightening-like motion.

The radio-active man, invention of the University of California's radiation laboratories, makes his first appearance at the première. This mechanical man receives into his body actual radio-active substances from the cyclotron. A Geiger counter, hooked up with a loudspeaker, indicates exactly where these substances flow. This radio-active man brings to light the latest research in the war on malignant diseases.

Other dramatic exhibits will show the discovery, history, and development of many curative products, among them quinin and insulin. Part of the Mayo Clinic exhibit will be a survey and analysis of the latest techniques in plastic surgery.

One of the keynote exhibits of the medical section is that sponsored by the American Medical Association under the direction of Dr. Thomas Hull. Emphasizing four important fields of health work, the Association will honor the heroes of medicine and trace the development of many important discoveries. It will explain the part played by the basic sciences—physics, chemistry, and zoölogy—and of such clinical fields as pediatrics, neurology, surgery, dermatology, obstetrics, urology, internal medicine, ophthalmology, and otolaryngology. The relation of medicine to public health comprises the third section of the Association's exhibit. The fourth will show the rôle of physics in modern medicine by animated explanations of the hypodermic and thermometer, the x-ray machine and the microscope.

The California Medical Association, through its Cancer Commission, is sponsoring one of the most vital exhibits in the Hall of Science. Nonsensational in character, this display gives accurate, nonevasive answers to such queries as: What is cancer? What causes it? Is it inheritable? How does cancer spread and cause death?

Demonstrations of chemicals and physical factors which have been found to cause cancer, demonstrations of diagnostic methods and explanations of types of curative treatments will be shown. This exhibit is under the direction of Dr. Alson Kilgore of the Cancer Commission, Dr. T. Henshaw Kelly of the State Medical Association, and Dr. Milton Silverman of the Advisory Committee.

The extensive use of chemistry in daily life will comprise a large section of the exhibit space in the Hall of Science. The rôle of chemical warfare to eliminate disease will be explained by a display showing the treatment of syphilis with modern heavy metal compounds and fever therapy; the treatment of malaria with the new synthetic substitutes for quinin; the treatment of coccal infections such as puerperal fever, streptococci bacteremia, certain types of pneumonia and gonorrhea.

The use of chemicals to fight human and animal disease carriers, and the part played by research chemistry in sanitation and public health, will also be dramatically presented.

A comparison of the ultimate cost of disasters to the nation as against the cost of their prevention will be graphically illustrated. Classifying disasters as "diseases of the social body," the American Red Cross will demonstrate the prevention, relief, and control of catastrophies.

An exhibit showing the use of daphnia magna as the ideal pharmacological test animal is expected to open up whole new fields of experimentation. A transparent crustacean, daphnia possesses well-developed muscular, nervous and glandular systems, hence it serves as an excellent test animal for detection of the presence or absence of substances affecting these systems.

ANNUAL REGISTRATION DUE ON JANUARY 1, 1939

Every practitioner of medicine and surgery holding a license to practice in California is required by law to register annually, on or before January 1, with the secretary-treasurer of the Board of Medical Examiners and at that time to pay a fee of $2. Failure to pay the required fee within sixty days after January 1 works a revocation of a license and thereafter a license may be reissued only after application and the payment of a $10 penalty.

The addresses of the offices of the Board of Medical Examiners of the State of California appear in every issue of

---

[†] The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. George G. Reinle of Oakland is the chairman and Dr. George H. Kress is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. George H. Kress, Room 2004, Four Fifty Sutter Street, San Francisco.

[*] For California Medical Association cancer exhibit item, see page 51.

California and Western Medicine, under the roster of miscellaneous California medical organizations, at the bottom of advertising page 6.

RADIO PERIOD DIALOGUE ON STATE HUMANE DOG-POUND ACT (INITIATIVE NO. 2)

A radio broadcast against Initiative No. 2, and sponsored by the Los Angeles County Medical Association, was placed on the air prior to the November 8, 1938, state election. Because it may be of value to others when called upon to oppose the antivivisectionists groups, the script is given a place in this issue. Readers may enjoy reading the dialogue. (See advertising page 39 for the text.)

EXHIBIT OF PLANS FOR MODERN OFFICES FOR PHYSICIANS

At the 1939 annual meeting of the California Medical Association it is desired to have in the Scientific Exhibit a booth devoted to pictures and floor plans of modern offices for physicians.

The assistance of all members who have recently constructed new offices would be appreciated by the Scientific Committee, and if those who would help in this will send their names in to the central office of the Association, 450 Sutter, San Francisco, the Committee will then advise them as to further details of the exhibit.

PACIFIC STATES MEDICAL EXECUTIVES' CONFERENCE

The second Pacific Coast conference was held at Portland, Oregon, December 4. The meeting was attended by representatives from California, Idaho, Oregon, and Washington.

Organized medicine now finds itself faced with so many problems and so much to consider that every possible method of reaching solutions must be utilized. With expectation that the Pacific States might help one another in solution of similar problems, the first Pacific Coast conference was called in San Francisco last February. Those in attendance were impressed with the unity of needs of organized medicine in the Pacific region and, therefore, anticipated an even more valuable conference when Charles Sears, President of the Oregon State Medical Society, invited representatives from Arizona, California, Idaho, Nevada, and Washington to meet with the Oregon group in Portland.

Such similarity of problems and so many matters of regional interest were brought to light, and so much information was given on activities of neighboring state organizations, that the conference was established as a permanent organization. By-laws of the organization were presented by a committee of which Dr. George H. Kress of California was chairman. Henceforth it is to be known as the Pacific States Medical Executives' Conference and will draw its personnel from those in positions of responsibility in state associations of California, Idaho, Montana, Nevada, Oregon, Utah, Washington, and Wyoming. The next meeting is scheduled for Seattle.

The by-laws provide that the conference is not to be a legislative body, but is intended only to be mutually advisory and a means of trading ideas for solution of problems confronting state organizations of the Pacific region.

The most interesting feature of the Portland meeting was the discussion by members of the California delegation of plans to be brought before a special meeting of the California House of Delegates on December 17. Owing to the importance of the proposals revealed and the fact that they had not yet been officially acted on, the California participants requested that their discussion remain unreported. Official report of the coming meeting of the California House of Delegates will reveal the extensive nature of the far-reaching plans proposed for California. Those in attendance at the Portland conference appreciated the opportunity of this preview afforded by the California delegation, and the many questions brought out were evidence of the interest evoked.

Next in interest was the discussion of several federal activities in regard to medical care. The first discussion on these matters came from V. W. Spickard of Seattle, who warned of the attempts of welfare and social departments to obtain administrative authority over funds now appropriated and probably to be appropriated by the Federal Government in the coming legislative session. It was his thought that such funds, appropriated for furthering health activities, should be administered as far as possible through state boards of health or state health departments. It was suggested that the advantages of such power might be misused by such departments of health as were not in close contact with the aims and purposes of organized medicine. This objection, however, was answered when it was brought out that, as a general principle, state departments of health are usually more closely attuned to the ideals of organized medicine than are departments of social welfare. All representatives at the conference saw the importance of this suggestion, and a resolution was passed to the effect that each state organization make vigorous effort to have federal funds for health activities controlled by state departments of health rather than by departments of welfare.

As a portion of the discussion on federal funds, the proposals of the federal farm security plans for medical care were discussed. The consensus was that it is possible to handle this type of work only through county and local societies. Since it has been extremely difficult to get the federal administrator to accept any responsibility for statewide plans, it was brought out that the local societies should be cautioned against accepting fee schedules too small to provide adequate service. Fear was expressed that acceptance by one county society of very small fees might be used to influence other societies toward unpractical contracts.

The afternoon session of the conference brought out a discussion of methods of publicizing organization policies and activities to both the medical profession and the lay public. The meeting was closed after discussion by Martzloff of Oregon and Dudley of Washington on malpractice insurance. Oregon's plan of granting monopoly to one insurance carrier was explained in some detail by Martzloff. He stated that cost of insurance to members of the Oregon State Medical Society had by this plan been reduced to unbelievably low figures, suits had markedly diminished in number, and splendid coöperation had been obtained between the insurer and the society. Dudley explained the workings of the Washington State Medical Defense Fund.

Those in attendance at the meeting were Charles Sears, president of the Oregon State Medical Society, chairman of the conference: John Fitzgibbon, Portland, Oregon, delegate to the American Medical Association; Morris Bridgeman, Portland, secretary, Oregon State Medical Society; Mr. Clyde Foley, executive secretary, Oregon State Medical Society and secretary of the conference; Charles Manlove, hospital executive of Portland; Charles Hunt, Eugene, president-elect, Oregon State Medical Society; Karl Martzloff, Portland, member of the Council of the Oregon State Medical Society. Other members of the Council of the Oregon State Medical Society were Leslie Kent, Eugene; Frank Power, Salem, and George Henton, Portland. Ralph A. Fenton, Portland, trustee of the American Medical Association, was also present. Washington was represented by Harry Rhodehamel, Spokane, president of the Washington State Medical Association; V. W. Spickard, Seattle, secretary of the Washington State Medical Association; Mr. Jack Geoffroy, executive secretary, Washington State Medical Association; Ray Zech, Seattle, delegate to the American Medical Association; C. W. Knudson, president, King County Medical Society and

PACIFIC STATES MEDICAL EXECUTIVES' CONFERENCE, HELD IN PORTLAND, OREGON, SUNDAY, DECEMBER 4, 1938

Front row (Left to Right): Dr. J. N. Davis, Twin Falls, Idaho, Secretary, Idaho State Medical Association; Dr. Charles E. Sears, Portland, Oregon, President, Oregon State Medical Society; Dr. George G. Reinle, Oakland, California, Ex-President and Chairman of Committee on Public Relations, California Medical Association; Dr. Charles A. Dukes, Oakland, California, President-elect, California Medical Association; Dr. F. C. Gibson, Potlatch, Idaho, President, Idaho State Medical Association; Dr. Homer D. Dudley, Seattle, Washington, Chairman, Board of Governors of Defense Fund, Washington State Medical Association; Dr. V. W. Spickard, Seattle, Washington, Secretary-Treasurer, Washington State Medical Association; Dr. Herbert L. Hartley, Seattle, Washington, Assistant Editor of Northwest Medicine, Washington State Medical Association; Dr. George E. Henton, Portland, Oregon, Third Vice-President, Oregon State Medical Society.

Middle row (Left to Right): Mr. Jack M. Geoffroy, Seattle, Washington, Executive Secretary, Washington State Medical Association; Dr. S. P. Cromer, Chicago, Illinois, member of the staff of the Council on Medical Education and Hospitals of the American Medical Association; Dr. Clarence W. Knutson, Seattle, Washington, President, Public Health League of Washington; Dr. Raymond L. Zech, Seattle, Washington, Delegate to the American Medical Association, Washington State Medical Association; Dr. C. H. Manlove, Portland, Oregon, Superintendent, Good Samaritan Hospital and representing the Oregon Association of Hospitals, Oregon State Medical Society; Dr. Richard B. Adams, Portland, Oregon, member, Committee on Public Policy, Oregon State Medical Society; Dr. John H. Fitzgibbon, Portland, Oregon, Delegate to American Medical Association, Oregon State Medical Society; Dr. Albert I. Bouffleur, Seattle; Mr. Clyde C. Foley, Executive Secretary, Oregon State Medical Society; Dr. L. S. Kent, Eugene, Oregon, Councilor-at-large, Oregon State Medical Society; Dr. Stanley Lamb, Portland, Oregon; Dr. Charles E. Hunt, Eugene, Oregon, President-elect, Oregon State Medical Society; Dr. F. B. Freeland, Warm Springs, Oregon; Dr. W. H. Buermann, Portland, Oregon; Dr. George H. Kress, San Francisco, California, Secretary, California Medical Association.

Back row (Left to Right): Dr. H. E. Rhodehamel, Spokane, Washington, President, Washington State Medical Association; Dr. J. C. Hayes, Medford, Oregon, Councilor, Fourth District, Oregon State Medical Society; Dr. Morris L. Bridgeman, Portland, Oregon, Secretary, Oregon State Medical Society; Mr. John J. Coughlin, Portland, Oregon, Legal Counsel, Oregon State Medical Society; Dr. C. W. McCain, Hood River, Oregon, President, Mid-Columbia Medical Society; Dr. R. W. Hemingway, Bend, Oregon, Councilor, Fifth District, Oregon State Medical Society; Dr. H. R. Kauffman, Toledo, Oregon; Dr. Guy L. Boyden, Portland, Oregon, Councilor, First District, Oregon State Medical Society; Dr. L. M. Bain, Albany, Oregon, Secretary, Linn County Medical Society; Dr. F. L. Ralston, La Grande, Oregon, Second Vice-President, Oregon State Medical Society; Dr. H. M. Francis, Corvallis, Oregon; Dr. F. K. Power, Salem, Oregon, member, Bureau of Medical Economics, Oregon State Medical Society.

Washington Public Health League; H. D. Dudley, Seattle, director of the Medical Defense Fund; and H. L. Hartley, Seattle, assistant editor, *Northwest Medicine.* Idaho was represented by Frank Gibson, Potlach, president, Idaho State Medical Association, and J. N. Davis, Twin Falls, secretary. The California delegation consisted of Charles Dukes, Oakland, president-elect of the California Medical Association; George Reinle, Oakland, chairman of Public Relations Committee of California Medical Association, and George H. Kress, San Francisco, secretary of the California Medical Association and editor of CALIFORNIA AND WESTERN MEDICINE.

EXHIBIT AT THE GOLDEN GATE FAIR*

Causes and Cure of Cancer

Organized medicine will teach the public that the cause of cancer may lurk in about forty innocent-appearing chemicals, and even overexposure of the body to light, in a special exhibit at the 1939 Exposition, it was learned yesterday.

The exhibit, to be sponsored by the California Medical Society, will vividly display the chemicals involved, most of which are derivatives or impurities of coal tar and some types of paraffin.

The coal-tar products are used to make aniline dyes, aromatic substances and other articles coming into increased use with the advance of chemistry into industry.

A Warning

The medical exhibit will warn the public against excessive doses of strong light and heat, such as sun bathing or overexposure to any form of lamp rays, and against repeated contact with radium substances.

The cancer specialists said they would teach that chronic irritation, injury, and infection could help to give cancer a start, but, they added, "contrary to popular belief, these alone never cause cancer."

"Cancer can be cured," said another pronouncement, "but cure is possible only if the disease is recognized early and treatment is started before the disease has spread."

The exhibit will include graphs, showing the proportionate decline of the patient's chances as the disease spreads.

In lip cancer they will say that all cases can be cured if caught before the disease agent reached one gland; 70 per cent can be cured after spreading to only one gland under the jaw; and 40 per cent after reaching two glands.

---

* For other article on the Fair, see page 49.

Chances of Cure

It will say, further, that cancer of the breast can be cured in 70 per cent of the cases if caught before reaching one arm-pit gland; in 18 per cent after reaching one gland there; but in only 5 per cent of cases after spreading to two arm-pit glands.

The exhibit will be under the supervision of Dr. T. Henshaw Kelly of the California Medical Society; Dr. Alson Kilgore of the California Cancer Commission, a division of the State Medical Association; and Dr. Milton Silverman, head of the Exposition's science staff.—San Francisco *Chronicle*, December 26, 1938.

COMPONENT COUNTY MEDICAL SOCIETIES

HUMBOLDT COUNTY

The Humboldt County Medical Society met on the evening of November 7 at the Eureka Inn.

The meeting was presided over by the president, Dr. Francis Stump. Twenty-one members and the following visitors were present: Dr. William W. Roblee, President of the California Medical Association; Dr. George H. Kress, Secretary of the State Association; and Dr. Henry S. Rogers, Councilor of the Ninth District.

Dr. Max Goodman of Eureka presented an excellent paper, and the visiting officers spoke on action and legislation of the State Association and the coöperation the county societies can give the State officers.

The following officers were elected for the year 1939: Samuel P. Burre, president; John S. Chain, vice-president; John A. Lane, treasurer; Joseph S. Woolford, secretary; Wilson Stegeman, delegate; Lane Falk, alternate.

Lawrence A. Wing, *Secretary*.

⁂

MARIN COUNTY

Dr. Karl A. Schaupp addressed the combined meeting of the Marin County Medical Society and its Auxiliary on the present outlook regarding medicine in California. There was a good attendance at the meeting, which was held at the Marin Golf and Country Club, and all were well pleased with his explanation of the situation.

Carl W. Clark, *Secretary*.

⁂

MENDOCINO-LAKE COUNTY

The members of the Mendocino-Lake County Medical Society were guests of Doctor Cushman at Talmage on Saturday evening, December 10, 1938, at 7:30 o'clock. The doctors' wives, as well as the dentists and their wives, were invited. The dinner was followed by two movies, furnished by Dr. William P. Shepherd of the Metropolitan Life Insurance Company. The subject matter of these movies dealt with *Pneumonia*—one of them for lay audiences, and the other for physicians. Dr. George H. Kress, Secretary of the California Medical Association, was present and spoke on *Problems in Medical Organization*.

Report was made on the gratifying election returns on Amendment No. 2.

Attention was called to the special meeting of the House of Delegates, scheduled for December 17, to consider a state-wide health service.

Robert B. Smalley, *Secretary*.

⁂

SACRAMENTO COUNTY

The regular meeting of the Sacramento Society for Medical Improvement was called to order by the president, Dr. Dave Dozier, on November 15, 1938, at the Auditorium. There were seventy-two members and guests present.

The society was honored by the presence of Dr. William W. Roblee, President of the California Medical Association, and Dr. George H. Kress, the Association Secretary. Doctor Roblee discussed *The Functions of the California Medical Association*, and the important subject of *Medical Service Plans*. A brief outline of the plan now being formulated by the California Medical Association was presented. Doctor Kress discussed *Present Medical Trends and the Postgraduate Conferences*. After some discussion a motion was made by Doctor Ankele that the Sacramento Society for Medical Improvement endorse and support the action of the Council of the California Medical Association in working out plans for medical care. The motion was passed.

The applications for membership of Drs. W. Harding, J. Dillon, and A. M. Henderson, Jr., were read for the first time.

Dr. Ralph Teall made a motion that the Society express its appreciation to the Womans' Auxiliary for the able assistance given in the recent election to defeat Proposition No. 2. The motion passed unanimously.

There being no further business the meeting was adjourned.

G. E. Millar, *Secretary*.

⁂

SAN JOAQUIN COUNTY

The regular annual supper meeting of the San Joaquin County Medical Society was held at the Hotel Wolf roof garden, December 1, 1938. The meeting was called to order by the president, Dr. A. C. Boehmer, at 7:45 p. m.

A motion from the floor was made that the reading of the minutes of the preceding meeting and the financial statement of the secretary be dispensed with. The motion carried.

The Election Committee reported the following results on the ballot for officers of 1939: N. P. Johnson, president; Frank Vieira, first vice-president; R. L. Owens, second vice-president; G. H. Rohrbacher, secretary-treasurer; A. C. Boehmer, J. O. Eccleston, T. W. Kyddson, D. R. Powell, H. C. Rixford, V. R. Ross, and G. K. Wever, directors; Frank Doughty, G. H. Sanderson, and Dewey Powell, delegates; C. A. Broaddus, R. T. McGurk, and C. V. Thompson, alternates.

Dr. Dewey Powell delivered a eulogy on the passing of Dr. Elmer William Weirich of Angels Camp.

Doctor Eccleston announced that there would be a new form for the American Medical Association survey presented to the Society in the next week or ten days, and asked for coöperation in the filling out of it.

Dr. C. A. Broaddus presented the certificates of those who were accepted as Fellows in the Medical Academy of Graduate Study.

President A. C. Boehmer stated that this was the last meeting he would preside over, as he will be in Chicago in January. He thanked the Board of Directors and the Society for a successful year.

The paper of the evening was presented by Dr. Leo Eloesser of the surgical staff of the Stanford Medical School. Doctor Eloesser sketched the political results for the civil war in Spain and talked on the *Medical Problem of the War as Viewed from the Loyalists' Side*. His paper was illustrated by lantern slides, showing the equipment used and types of field hospitals. This paper was extremely interesting and caused considerable comment and questions from the floor.

There being no further business to come before the Society, the meeting was adjourned at 11:05 p. m.

G. H. Rohrbacher, *Secretary*.

⁂

TULARE COUNTY

A regular meeting of the Tulare County Medical Society was held at the Hotel Johnson, Visalia, at 7 p. m., on November 27, 1938. President Elmo Zumwalt called the meeting to order.

Our district councilor, Dr. A. E. Anderson, was present and took up various organization problems. He discussed the *Plan of Medical Service Insurance* which has been devised by the California Medical Association and urged us to send our delegate to the December meeting. He reported on the appointment of Doctor Scarbrough as district medical advisor for the Agricultural Workers Health and Medical Association. Another plea was made for postgraduate conferences to be held in this district.

The president appointed Dr. Austin Miller of Porterville to attend the December meeting in Los Angeles as delegate from the Tulare County Medical Society.

Dr. Max Goldstein of Fresno was next introduced as guest speaker of the evening. He discussed the *Common Eye, Ear, Nose, and Throat Conditions and Treatment.* The talk was of a very practical nature, and many useful procedures were brought to our attention. A vote of thanks was extended Doctor Goldstein for his efforts in coming to speak to us.

The business session of the evening included the reading of accumulated correspondence. The first subject dealt with the submitted schedule of fees for the Agricultural Workers' Health and Medical Association.

A request was made to have the newly appointed district medical advisor, Doctor Scarbrough, attend our next meeting so that we might clarify the various points in the fee schedule.

A letter was received from *Life* in acknowledgment of our telegram in behalf of their illustrated article regarding animal experimentation.

A letter was read from the Nurses' Association of Tulare County, specifying the new eight-hour duty plan. This was endorsed by the Tulare County Medical Society.

A communication from the Southern California Society for the Control of Syphilis and Gonorrhea was given consideration.

Because of the lateness of the hour, further business was postponed until the next regular meeting. Adjournment took place at 11:30 p. m.

Present at the meeting were Dr. M. Goldstein of Fresno, guest speaker of the evening; Dr. A. E. Anderson, district councilor of Fresno; and the following members and guests: Doctors Zumwalt, Seligman, Betts, Hardin, Kohn, Austin Miller, Fillmore, Burton, Weiss, DeBusk, Ruth, Brigham, P. Miller, Falk, Cronemiller, Powell, Rogers, Annie Bond, Lipson, Zeller, Rosson, Mathias, Zink, Watke, Ginsburg, Seiberth, Ireton, Guido, Neale, and Mr. Carroll.

KARL F. WEISS, *Secretary.*

In Memoriam

Dundas, Robert Chester. Died at Los Angeles, November 20, 1938, age 70. Graduate of Rush Medical College, University of Chicago, 1890. Licensed in California in 1897. Doctor Dundas was a member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

✝

Fitzpatrick, Earl Berton. Died at Martinez, December 11, 1938, age 51. Graduate of the Oakland College of Medicine and Surgery, 1910, and licensed in California the same year. Doctor Fitzpatrick was a member of the Contra Costa County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✝

Petty, Charles Odell. Died at Fullerton, November 17, 1938, age 67. Graduate of Gross Medical College, Denver, 1900. Licensed in California in 1915. Doctor Petty was a member of the Orange County Medical Society, the California Medical Association, and the American Medical Association.

✝

Potter, Clarence Denver. Died at Berkeley, December 8, 1938. Graduate of Hahnemann Medical College of the Pacific, San Francisco, 1896, and licensed in California the same year. Doctor Potter was a member of the San Francisco County Medical Association, the California Medical Association, and the American Medical Association.

✝

Scribner, Richard George. Died at Sacramento, November 19, 1938, age 45. Graduate of the University of California Medical School, San Francisco, 1921, and licensed in California the same year. Doctor Scribner was a member of the Sacramento Society for Medical Improvement, the California Medical Association, and the American Medical Association.

✝

Sundin, Peter Olaf. Died at Los Angeles, November 29, 1938, age 61. Graduate of the University of Southern California School of Medicine, Los Angeles, 1907, and licensed in California the same year. Doctor Sundin was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

✝

Weirich, Elmer Williams. Died at Angels Camp, November 20, 1938, age 72. Graduate of Hahnemann Medical College of the Pacific, San Francisco, 1889. Licensed in California in 1890. Doctor Weirich was a retired member of the San Joaquin County Medical Society, the California Medical Association, and the American Medical Association.

Victor G. Vecki

1857–1938

The recent death of this pioneer member of our society closed a life more full than the average of experience, travel, professional attainment, and culture. Born in 1857 in Zagreb, Jugoslavia, Doctor Vecki was educated in the schools of that city. He received his college education in the Imperial and Royal University of Vienna, where he also was given his medical degree in 1881. He was a captain in the Austro-Hungarian Army, and Royal Croatian Sanitary Councilor. He came to California in 1892, practicing the first four years in San Jose. He entered practice in San Francisco in 1896. In the first years he had a large general practice, but was one of the pioneers in this city in the speciality of urology. One of his colleagues recently died, Dr. Louis Bazet; and another is still with us and very active, Dr. Paul Campeche.

Doctor Vecki was a member of the American Urological Society, the California State Medical Association, and a Fellow of the American Medical Association. He was our State Medical Society delegate to the latter society for about thirteen years, and was instrumental in bringing the national convention here in 1923. He was the author of many medical articles as well as nonmedical. His latest work was a revision last year of his book on the prevention of premature senility.

Doctor Vecki worked steadily until the beginning of this year and was in his office at intervals up till sixteen days from his death. In his passing we have lost another pioneer of the horse-and-buggy days, a man who was unusually well educated in medicine, and who was well versed in all the phases of the art of living. His widow survives him, as do three sons, Victor J. Vecki, D.D.S.; Marion Vecki, attorney at law; and Morrell Vecki, a member of the San Francisco County Medical Society.

H. M. F. Behneman, M.D.

✠

Elmer William Weirich
1885–1938

Dr. Elmer William Weirich of Angels Camp, Calaveras County, long a member in good standing in the San Joaquin County Medical Society, passed from this life at his home in Angels Camp on Sunday, November 20, 1938.

Doctor Weirich, a native of Massillon, Ohio, had lived in California fifty-three years, forty-two of which were spent in Angels Camp and the remainder in San Francisco, Murphys, and Copperopolis. For a time he was company physician for the Calaveras Copper Company at Copperopolis, and later in Angels Camp he was physician for the employees of the Carson Hill Mine at Melones. For more than twenty years he was superintendent of the Calaveras County Hospital at San Andreas. Ill health forced his retirement three years ago.

Doctor Weirich was a typical country doctor, administering to the sick. Those unable to pay received the same kindly service as those who could afford to pay. He never hesitated to accept a call, night or day, and was ever ready to aid those in distress.

A leader in his community, he took a deep interest in local, state and national affairs, and for years was active in Republican Party political affairs of the state and served on the County Republican Central Committee for many years.

As owner of a ranch property on the Murphys grade road, he became interested in the affairs of the Calaveras Water Users' Association, and for a number of years was president of that organization and led the fight for irrigation water service in behalf of the farmers in the Angels-Murphys section. He was also a charter member of the Angels Booster Club.

Surviving are his wife, two daughters, both living in Angels Camp, a sister in Ohio, and three grandchildren. To these members of the family the San Joaquin County Medical Society express the very high regard in which Doctor Weirich was held, and extend to them our sincere sympathy in their great loss.

Dewey Powell, M.D.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION[†]

MRS. CLIFFORD A. WRIGHT..............................President
MRS. FRED H. ZUMWALT..............Chairman on Publicity
MRS. FRANK H. BODIN..Assistant Chairman on Publicity

Component County Auxiliaries

Alameda County

A book review of the "Horse and Buggy Doctor" by Alfred E. Hertzler, M. D., was given by Mrs. James E. Wales at the regular meeting of the Woman's Auxiliary to the Alameda County Medical Association. The meeting was held at the Claremont Country Club on November 18.

Mrs. A. A. Alexander arranged a very interesting exhibit of medical equipment of the horse and buggy era.

Members brought old toys to be repaired for use at the Toy Loan Center.

Mrs. H. J. Templeton, a member of the Auxiliary, entertained with vocal selections, accompanied by Mrs. F. A. Bennett.

Mrs. Charles A. Dukes was the hostess of the day, assisted by Mrs. Harry Akesson, who was chairman of reservations.

Mrs. Grant Ellis, *Publicity Chairman.*

⁂

Fresno County

On November 1, Dr. Margaret Smythe, director of the State Hospital for the Insane at Stockton, was the hostess to the members of the Woman's Auxiliary to the Fresno County Medical Society.

It was very interesting and a privilege to walk through the grounds and buildings to see the inmates at their various routine duties. Of particular interest were the descriptions of various cases, the satisfactory response to proper care and the progress made.

Doctor Smythe expressed a desire and stressed the need for a separate institution for children, especially those of adolescent age. In separating the youth from adults more effective measures toward a complete cure might be accomplished.

The group were entertained for luncheon by Doctor Smythe in her beautiful colonial home.

Those who were present went home with the memory and satisfaction of a very pleasant and profitable day.

* * *

The University-Sequoia Club was the setting for the annual Hygeia benefit and Christmas party given by the Fresno Woman's Auxiliary on December 6, 1938.

Thirty-seven doctors' wives reserved tables and brought their friends for an enjoyable evening of bridge. The members and guests were received by the president, Mrs. C. M. Vanderburg, assisted by Mrs. Guy Manson.

The doctors of the County Medical Society met on the same evening in the University-Sequoia Club, and at the conclusion of their meeting joined the ladies for a social hour and refreshments.

Mrs. Charles H. Ingram, *Publicity Chairman.*

[†] As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Frank H. Rodin, Assistant Chairman of the Publicity and Publications Committee, 2457 Bay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Rodin and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

Kern County

In October the Woman's Auxiliary to the Kern County Medical Association met at the home of Mrs. P. N. Root. The program for the evening included a book review of Dr. Alfred E. Hertzler's "Horse and Buggy Doctor."

* * *

The members of the Kern County Medical Association met jointly with the Woman's Auxiliary and guests for dinner in November.

The guest speaker, Dr. Leo Eloesser, gave a description of *Medical Aspects of the Present War in Spain.*

Mrs. John J. McCarthy, *Secretary.*

⁂

Los Angeles County

The Woman's Auxiliary to the Los Angeles County Medical Society met at the County Medical Building on November 22, 1938, at 12 noon. The president, Mrs. William H. Leake, presided.

The guest speakers were: Judge Charles W. Fricke of the Superior Court of Los Angeles, who spoke on *Expert Testimony and How a Doctor Should Address a Jury,* and Mr. Clarence George, local editor, who spoke on *Personality.*

Mrs. Leake thanked the members for their splendid work during the recent political campaign.

* * *

Approximately $200 was raised at a benefit given on November 29 for Christmas baskets to be distributed to needy families.

Over two hundred doctors and their wives attended the performance of "The Three-Cornered Moon," directed by Mr. Henry Duffy at the Las Palmas Theater.

The president, Mrs. William H. Leake, and her committee, which included Mesdames A. Brockway, J. Martin Askey, William Daniel, C. W. Irish, Paul D. Foster and Karl Von Hagen, were gratified by the large attendance and the success of the undertaking.

Mrs. Karl Von Hagen, *Publicity Chairman.*

⁂

Marin County

The Sleepy Hollow Country Club was the meeting place for the Woman's Auxiliary to the Marin County Medical Association on October 27 at the dinner hour. The president, Mrs. Bernard Conroy, presided. Twenty-four members were present.

Mrs. Conroy appointed the following chairmen: Mrs. F. Lowe, Membership and Organization; Mrs. Robert Furlong, Program and Health; Mesdames A. Miller and D. Fowler, Hygeia; Mrs. G. Landrock, Public Relations; and Mrs. C. DeLancey, Publicity.

A letter was read inviting the Auxiliary to send a delegate to a community meeting for the consideration of organizing a county health clinic and the appointment of a county health officer. After thoroughly discussing the subject the matter was referred to the Advisory Committee of the Marin County Medical Society, who were meeting at the same time and place. They ruled that the Auxiliary may send an uninstructed delegate to the meeting.

Mrs. Conroy introduced Mrs. Frank H. Rodin, the guest speaker, whose subject was *Health Education.* She caused the members to feel that they had an important part and definite responsibility in spreading the knowledge of healthy living in our community.

* * *

A very interesting program was presented to the members and guests of the Woman's Auxiliary of Marin County at their dinner meeting held at the Marin Golf and Country Club at 7 p. m., on December 2. The president, Mrs. Bernard Conroy, presided. Twenty-three members were present.

A committee of six was appointed to make the necessary arrangements for a bridge tea to be given in January, the proceeds of which are to be used for a philanthropic project.

The doctors of the Marin County Medical Association meeting at the same time and place, discovered after dinner that they were without a speaker, so they joined the women for their program.

Mrs. Conroy introduced the speakers of the evening: Dr. Henry Rogers, Councilor for the Ninth District, spoke on *The Farmers' Reaction to Socialized Medicine.*

Dr. Karl Schaupp, a member of the Committee on Hospitals, Dispensaries, and Clinics, presented a very clear and definite outline of *A State Socialized Medical Program.* He advised the medical profession to study the proposed plans and take an active interest now, rather than "wake up" and find a program forced upon them that might be neither agreeable nor practical. "A medical program of necessity should be framed by a medical group."

Mrs. C. A. De Lancey, *Publicity Chairman.*

⁂

Sacramento County

The November meeting of the Woman's Auxiliary to the Sacramento Society for Medical Improvement was held at the home of Mrs. Burt Howard.

After an interesting business meeting, Mrs. Harold Trimble, State Chairman of Hygeia, spoke to the members of the importance of the *Hygeia,* health magazine, to the Auxiliary and the community, urging the members to subscribe and also to interest their friends in subscribing.

The Auxiliary was entertained by a tableau, *The Seven Ages of Man,* ably presented by the following members: Mesdames George Spencer, W. Pope, S. Christian, Gustave Wilson, M. Lipp, Glen Harding, and James Yant.

Mrs. O. F. Johnson, *Publicity Chairman.*

⁂

San Diego County

The fourth and very successful Public Health Institute was held by the Woman's Auxiliary to the San Diego County Medical Society on November 1 at the House of Hospitality in Balboa Park.

This Public Health Institute was arranged to provide authentic scientific medical information to the community of San Diego.

Mrs. F. J. Lindenmulder was chairman of program, assisted by Mesdames C. O. Tanner, Emil Black, R. A. Schneider, and E. H. Christopherson, who acted as ushers.

The program was divided into two sessions, both of which were very well attended. At the morning session, subjects concerning the health of the school child were presented as follows:

Dr. S. J. McClendon, pediatrician, discussed *The Problems of Contagious Diseases of the School Child,* stressing the importance of the early prevention of contagious diseases.

An illustrated talk on the *Care of the School Child's Teeth* was given by Dr. Harvey Stallard, dentist.

Dr. R. Emerson Bond spoke on *Pertinent Legislation.*

The mothers of growing children were especially invited to attend this institute.

The evening session took place in the auditorium of the House of Hospitality at 8 p. m.

Dr. C. O. Tanner opened the evening session with a talk on *Pertinent Legislation.*

The Control of Venereal Diseases as a Government Function was presented by Dr. Ralph Mullenix.

A panel discussion on *Tuberculosis* was led by Mrs. Willard Newman, with Doctors Bryant Simpson, President of the San Diego County Medical Society, Stephen A. Parowski, and R. A. Schneiders discussing the subject and answering questions from the floor.

Mrs. H. K. Albertson, *Publicity Chairman.*

*

San Joaquin County

The December meeting of the Woman's Auxiliary to the San Joaquin County Medical Society was held at the home of Mrs. Percy B. Gallegos. Twenty-four members were present.

The Auxiliary is carrying on a plan which was adopted last year. Each member contributes $1 to the Hygeia Fund, which enables them to place subscriptions to *Hygeia* in schools, beauty shops, clubs for adolescent children, and other organizations.

At the conclusion of the business meeting a delightful program of Christmas tales and music was presented by the talented new member, Mrs. Ellis Harbert.

A social hour concluded the meeting.

Mrs. George K. Wever, *President.*

*

San Mateo County

The doctors of the San Mateo County Medical Society were the guests of the Woman's Auxiliary at their meeting on November 16 at the Benjamin Franklin Hotel.

The guest speaker, Dr. Chauncey Leake, chief of the Department of Pharmacology at the University of California, gave a very enlightening talk on *Drug Foolishness.* An interesting question period followed, and at the conclusion Dr. Paul Hanzlik discussed the subject for fifteen minutes.

* * *

The next meeting will take place at the Benjamin Franklin Hotel on January 23, where the members will meet for dinner.

Following the business meeting, Mrs. Paul Hanzlik will give a book review.

Mrs. J. G. Brigman, *Publicity Chairman.*

*

Santa Cruz County

The president, Mrs. Alfred L. Phillips, presided at the luncheon meeting of the Woman's Auxiliary to the Santa Cruz County Medical Society at Deer Park Tavern on November 28.

Doctor Havenhill gave a talk on the *Prevention and Cure of Cancer,* illustrated by pictures and microscopic slides.

Due to holiday activities, it was voted that there would be no meeting in December. The next regular meeting will take place in January, at which time *Socialized Medicine* will be discussed. Mrs. R. C. Alsberg,

Recording Secretary and Publicity Chairman.

NEVADA STATE MEDICAL ASSOCIATION

Minutes of the Thirty-Fifth Annual Meeting of the Nevada State Medical Association, Held at Reno, Nevada, September 23–24, 1938 †

The thirty-fifth annual meeting of the Nevada State Medical Association was called to order at 9:45 a. m. at Bowers Mansion, with President Harry W. Sawyer, presiding.

Doctor Sawyer then gave the president's address.*

Program

Friday, September 23, 1938

After the address of President Sawyer, the scientific program was commenced and the following papers were presented:

Chronic Allergy in Medical Practice, by Albert H. Rowe of Oakland, California. Discussed by J. A. Fuller and Earle L. Creveling.

Postoperative Distention: Prevention and Treatment, by A. R. Kilgore of San Francisco, California.

Kidney Infections: Pyelographic Diagnosis, by Miley B. Wesson of San Francisco.

Mental Disease as Met in General Practice, by R. A. Cushman of Talmage, California.

This concluded the scientific program for the day and recess was taken for lunch, which was served in the patio at Bowers Mansion.

Saturday, September 24, 1938

The meeting was called to order at Bowers Mansion at 9:40 a. m. by President H. W. Sawyer. The scientific program was immediately taken up and was as follows:

Complications of Pneumonia, by Philip King Brown of San Francisco.

Gastric and Duodenal Ulcer—The Case Against Gastroenterostomy, by Ernst Gehrels of San Francisco.

The Common Proctologic Disorders, by William H. Daniel of Los Angeles. Illustrated with motion pictures.

New Anesthetics and Methods—Carbon Dioxid Absorption with Cyclopropane, by A. R. Da Costa of Reno. Motion-picture demonstration.

Congenital Syphilis, by L. R. Brigman of Reno.

American Medical Association Radio Broadcasts.—The fourth series of programs broadcast in dramatic form portraying fictitious but typical incidents of significance in relation to health by the American Medical Association and the National Broadcasting Company, entitled "Your Health," began Wednesday, October 19, and will run consecutively for thirty-six weeks, *The Journal of the American Medical Association* for November 19 anounces. The program is broadcast over the Blue network of the National Broadcasting Company each Wednesday at 2 p. m. eastern standard time (1 p. m. central standard time, 12 noon mountain time, 11 a. m. Pacific time).

These programs are broadcast on what is known in radio as a sustaining basis; that is, the time is furnished gratis by the radio network and local stations and no revenue is derived from the programs. Therefore, local stations may or may not take the program, at their discretion, except those stations which are owned and operated by the National Broadcasting Company.

When to Select a Physician.—Before any medical emergency knocks at your door, become acquainted with a physician you know is reliable and, above all, who knows you, is the advice given by Edward D. Nix, Chicago, in "Beating Trouble to the Punch," appearing in the January issue of *Hygeia, the Health Magazine.*

To you who have moved into a strange community since you last saw your doctor, the author says, get acquainted with a physician while you and your family are all well. A letter to your last doctor, a nearby hospital or the local medical society will give you the names of two or three good physicians.

Then call one of them to your home to meet your family. When the need arises, often so unexpectedly, he knows with whom he is dealing and thus is immeasurably better equipped to meet any situation with a quick and accurate definition of the best plan of battle.

Do not measure age by the years that have flown, or yet by the mirror; it, too, may deceive. Measure it by the present condition of the human machine, by estimating the reserve stock of health, vitality and the apparent life-enjoying capacity remaining.

---

† A digest of the minutes of the business sessions will appear in the February issue of California and Western Medicine.

* President Sawyer's address appears in this issue of California and Western Medicine, on page 20.

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, St. Louis, Missouri, May 15 to 19, 1939. Olin West, M.D., Secretary, 535 North Dearborn Street, Chicago, Illinois.

California Medical Association, Hotel Del Monte, May 1 to 4, 1939. George H. Kress, M.D., Secretary, 450 Sutter Street, San Francisco.

* * *

Western Section, American Laryngological, Rhinological, and Otological Society, Spokane, Washington, January 29, 1939. Frederic G. Sprowl, M. D., Medical Arts Building, Spokane, Washington, Chairman.

Medical Broadcasts*

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of January is as follows:

Thursday, January 5—KECA, 10:45 a. m., The Road of Health.
Saturday, January 7—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, January 12—KECA, 10:45 a. m., The Road of Health.
Saturday, January 14—KFI, 8:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, January 19—KECA, 10:45 a. m., The Road of Health.
Saturday, January 21—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, January 26—KECA, 10:45 a. m., The Road of Health.
Saturday, January 28—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.

Health of the Nation.—The United States Public Health Service has announced that influenza made its seasonal rise during the four-week period ending October 8. The increase was about 35 per cent over the number of cases reported during the corresponding period of last year. The increased prevalence was noted particularly in the South Atlantic and South Central areas.

Smallpox has taken a decided drop, the current incidence being about 70 per cent of that for 1937.

Epidemic poliomyelitis was at the lowest stage recorded for any similar period during the last decade.

Meningococcus meningitis shows the lowest incidence reports for the past ten years.

Typhoid fever was also at the lowest point recorded during recent years.

Diphtheria showed a rise of about 20 per cent, but the disease is low compared with average incidence for the years 1933–1937.

Scarlet fever showed a normal increase.

There is every indication that the year 1938 will record the best public health conditions that have ever been established in the United States.

Error in Reprint Order.—Through an oversight, an order for reprints of an article, "Vitamin D in Acne," which appeared in California and Western Medicine in its issue of August, 1938, on page 127, was permitted to go to the printers without first securing the approval of the author, Merlin T.-R. Maynard, M. D., of San Jose. The reprints were later sent out by a pharmaceutical house, to the embarrassment of Doctor Maynard, to whom our regrets are expressed for the error.

Pacific Coast Society of Obstetrics and Gynecology. Dr. Alice Maxwell, member of the staff of the University of California Medical Center, has been named president-elect of the Pacific Coast Society of Obstetrics and Gynecology, the first woman to ever hold this position. The annual meeting of the society was held recently in Los Angeles.

Doctor Maxwell has been associate professor of obstetrics and gynecology for the past several years. She was graduated from the University at Berkeley in 1912, and three years later obtained her M.D. degree from the University's medical school. She has been a member of the medical school faculty since her graduation, and is now an acknowledged leader in her field.

The society to which Doctor Maxwell has been named the president apparent, includes obstetricians and gynecologists in Washington, Oregon and California, and has been established for seven years.

Lawrence Briefs Properties of Neutron Ray.—The formal introduction of a new and potentially powerful form of radiation into the field of medicine, to stand beside the x-ray and radium, is described by Dr. John H. Lawrence of the University of California Medical School in the Handbook of Physical Therapy of the American Medical Association, Chicago. The new radiation is provided by the neutron ray, a product of the University's cyclotron in Berkeley. Preliminary tests of the ray are now being made on human patients.

"For the first time the biologist and the physician have a penetrating form of radiation which behaves differently from any known quality of x-rays in its biologic effect," Doctor Lawrence said. "Whether the neutron ray will be relatively more destructive on one or more neoplasms (tumors) clinically, and will be a valuable aid in the therapy of neoplastic disease, only future work will tell.

"Modern developments in physics led to the induction of radio-activity in nearly all the elements and the production of a new form of biologically active and penetrating radiation—the neutron ray."

The radio-active substances produced by the cyclotron in addition to the neutron ray, and also found useful in different types of therapy, are likewise described by Doctor Lawrence in the article:

"Radio-active elements are 'tagged' atoms, but chemically they resemble their inactive relatives. Hence, study of their distribution after injection, by means of an electroscope or a Geiger counter, gives fundamental information concerning the metabolism of the various elements. Furthermore, a new method of comparing normal and disease processes is made possible. The selective deposition of elements in tissues (phosphorus in bone, iodin in the thyroid) introduces a new method of selective irradiation and offers possibilities in therapy."

---

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to California and Western Medicine, 450 Sutter Street, San Francisco, for inclusion in this column.

Pacific States Medical Executives' Conference.—A Western Medical Association, to serve as an advisory and study group for physicians in eight western states, was being formed in Portland, Oregon, on December 4, according to a United Press dispatch.

The organization, which is to represent Oregon, Utah, Washington, California, Nevada, Arizona, Idaho, and Wyoming medical associations, will iron out problems of prepaid medical fees and preventive medicine, the dispatch said.—Salt Lake City *Telegram*, December 7, 1938.

Venereal Disease Control Program.—Discussion of the venereal disease control program of the United States Public Health Service and possible action on new projects including studies of opium and quinine derivatives and the production and use of yellow fever vaccine featured the semi-annual meeting of the National Advisory Health Council at the National Institute of Health.

Dr. R. A. Vonderlehr, Assistant Surgeon-General in charge of the Division of Venereal Diseases of the United States Public Health Service, presented the Government's program for the control of venereal disease and comment on the progress which is being made in the various states with federal grants-in-aid.

The proposals regarding chemotherapy (studies centering around the opium and quinin derivatives) and the extension of virus diseases research to include laboratory studies of the production and use of yellow fever vaccine were presented by Dr. L. R. Thompson, Director of the National Institute of Health.

Members of the Council considered also a number of suggested coöperative studies to be carried on jointly by the National Institute of Health and scientists from various universities and research organizations.

Reports on the leprosy investigations in various parts of continental United States and in Honolulu, Hawaii, were presented, and discussion centered around the importance of such studies and the extent to which research should be carried on in the future.

Dr. Clifford E. Waller, Assistant Surgeon-General in charge of the Domestic Quarantine Division of the Public Health Service, presented for the consideration of the Council the proposed National Health Program, which includes an extension of public health facilities and improvements in medical care and hospitalization opportunities for people in all parts of the country, especially in those rural areas where the need is greatest.

The Council's attention was directed to the Hagerstown studies of health among children of school age, which are being directed by Dr. Thomas B. McKneely; and to the tuberculosis studies which are now in progress in Tennessee and Louisiana.

Dr. Thomas Parran, Surgeon-General of the United States Public Health Service, presided at the meeting, which was attended by the following members of the Advisory Council: Dr. Roger Adams, Department of Chemistry, University of Illinois, Urbana, Illinois; Dr. Eugene L. Bishop, Associate Professor of Preventive Medicine, Vanderbilt University, Nashville, Tennessee; Dr. Lowell J. Reed, Dean, School of Hygiene and Public Health, Johns Hopkins University, Baltimore, Maryland; Dr. Ernest R. Gentry, Lieutenant Colonel (M.C.) United States Army, Washington, D. C.; Dr. Waller S. Leathers, Dean, Vanderbilt University School of Medicine, Nashville, Tennessee; Dr. Roger I. Lee, practicing physician, Boston, Massachusetts; Dr. Esmond R. Long, Director, The Henry Phipps Institute, Philadelphia, Pennsylvania.

Dr. Karl Fredrich Meyer, Director, Hooper Foundation for Medical Research, University of California; Dr. John R. Mohler, Chief, Bureau of Animal Industry, Department of Agriculture, Washington, D. C.; Dr. Milton J. Rosenau, Professor of Public Health, University of North Carolina, Chapel Hill, North Carolina; Dr. Wilbur A. Sawyer, Director, International Health Division, Rockefeller Foundation, New York, New York; Dr. Alfred Stengel, Professor, Medicine, University of Pennsylvania, Philadelphia, Pennsylvania; and Dr. Charles S. Stephenson, Commander (M.C.) U. S. Navy, Washington, D. C.

Los Angeles Surgical Society.—The annual meeting of the Los Angeles Surgical Society was held on Friday and Saturday, December 9 and 10, 1938, with Dr. Owen H. Wangensteen of Minneapolis, Minnesota, as the guest speaker.

The program follows:

FRIDAY, DECEMBER 9

9 a. m.

Dry Surgical Clinic, Los Angeles County General Hospital
Owen H. Wangensteen
Pitfalls in Abdominal Surgery, Verne C. Hunt

12:30 p. m.

Luncheon—County Medical Building
1925 Wilshire Boulevard

2 p. m.

Gastrectomy and Gastro Duodenal Ulcers, E. C. Moore.
Mesenteric Thrombosis, Case Report, Charles W. Reeder.
Primary Hydatid Cyst of the Pleura, E. Vincent Askey.
Intraductal Papilloma and Carcinoma of the Breast, John W. Budd (by invitation).
The Status of Surgery in Angina Pectoris, Rupert B. Raney.
Repair of Laceration of Facial Nerves, Case Reports, Pierre Viole.
Vesico-Intestinal Fistula, Report of Case, Carl W. Rusche.

Recess, Ten Minutes

Carcinoma of the Thyroid, Case Report, C. T. Sturgeon.
Gas Bacillus Infection of the Abdominal Wall in Appendicitis, Case Report, Frank J. Breslin.
Sinus and So-Called Functional Nervous Disorders, F. M. Turnbull.
Intervertebral Disc Abscess Simulating Ruptured Nucleus Pulposus, G. H. Patterson.
Delayed Rupture of the Spleen, William H. Olds.
Bone Metastasis Following Carcinoma of the Breast, A. E. Gallant.
Surgical Drainage, Special Application of the Suction Principle, Rafe C. Chaffin.

Annual Formal Dinner—7 p. m.
California Club

SATURDAY, DECEMBER 10

9 a. m.

Dry Surgical Clinic, Los Angeles County General Hospital
Owen H. Wangensteen
Traumatic Diaphragmatic Hernia, with Motion Pictures, H. E. Schiffbauer

12:30 p. m.

Luncheon—County Medical Building
1925 Wilshire Boulevard

2 p. m.

Intussusception of the Ureter, H. C. Bumpus, Jr.
Intraperitoneal Rupture of the Urinary Bladder, Case Report, J. Norman O'Neill.
Physiological Changes in the Leucocyte Count, A. H. Foord (by invitation).
Liver Abscess with Perforation, E. C. Pallette.
Spindle Cell Carcinoma of the Thyroid, W. P. Kroger.
Malignant Melanoma of the Breast with Seven Year Follow-up, H. K. Bonn.
Traumatic Rupture of the Urethra, Case Reports, A. J. Scholl.

Ten-Minute Recess

Mortality in Obstructive Resection of the Colon, Clarence J. Berne.
Exophthalmic Goiter with Arterial Gangrene, Case Report, Harlan Shoemaker.
The Significance of Rectal Bleeding, Kenneth Smiley.
Granulomatous Infections of the Bone, Paul E. McMaster.
Familial Dermoid Cysts, Case Report, W. H. Brownfield.
Case of Right Para-Duodenal Hernia: Operation, Recovery, Donald Collins.
Mortality of Acute Perforation of Peptic Ulcer, Harold L. Thompson.

Formal Dinner Dance—7 p. m.
Wilshire Country Club

Fewer Deaths in California in 1938.—Records for the first six months of the present year indicate that the California general mortality rate for 1938 will be one of the lowest on record. Almost 5,000 fewer deaths were registered during the first half of 1938, as compared with the first half of 1937. The reduction is quite evenly distributed, all but ten counties of the state having contributed reduced numbers of deaths during the period studied. In Los Angeles County alone there were almost 2,000 fewer deaths during the first six months of this year, and in San Francisco there were 618 fewer deaths registered. In those interior counties of California, where migratory laborers have settled in large numbers, fewer deaths were recorded during the first half of 1938 than in the first half of 1937.

It would appear that this reduction is due, in part at least, to the absence of influenza in California during the early part of the calendar year. In 1937 influenza was widely prevalent and many deaths occurred during the early part of the year.

It would seem, however, that the population of this state is increasing rapidly. The increase in births is more than 11 per cent and the decrease in deaths is 12.5 per cent and the migration to California is extensive. If the present trend continues, the official United States census to be taken in 1940 will reveal a tremendous growth in the population of this state.

Following are the numbers of deaths registered in California counties during the first half of 1937 and 1938:

DEATHS
BY COUNTIES

County	Jan. to June, Inc.	
	1938	1937
Alameda	3,090	3,176
Alpine	......	......
Amador	39	50
Butte	295	326
Calaveras	47	63
Colusa	74	82
Contra Costa	348	438
Del Norte	28	32
El Dorado	62	75
Fresno	935	982
Glenn	61	57
Humboldt	290	340
Imperial	336	415
Inyo	33	41
Kern	655	717

Conference of Hospital Administrators in Seattle, February 19 to 23, 1939.—Administrators of 1,350 hospitals, located in the ten Western States, British Columbia, Alaska, and Hawaii, have been invited to Seattle, February 19 to 23, to study and discuss the colossal problem of health care.

With the nation agog over health and hospital insurance, socialized and subsidized medicine and hospitalization, with the next Congress preparing to act upon a national health program affecting every citizen and his family, the Seattle meeting promises unusual and timely interest.

The meeting is the thirteenth annual convention of the Association of Western Hospitals, allied with which the Western Conference, Catholic Hospital Association, the Washington, Oregon, and California state hospital associations, and the American College of Hospital Administrators will be in session.

"The Part of the Hospital in this Growing Program of Health Care," the convention theme, will be approached from every angle of consideration, and many eminent hospital authorities and medical doctors will discuss its phases.

At the same time, taking advantage of the assemblage of hospital and medical men from this wide area, most leading makers and distributors of hospital and clinical apparatus and equipment for treating disease, maladjustments and fractures, will display exhibits in a miniature hospital world's fair.

"Guard Against Syphilis."—"Guard Against Syphilis" is the slogan of National Social Hygiene Day to be observed throughout America on February 1. The day will be marked by some 5,000 meetings to highlight present community campaigns against syphilis and will focus public attention on vital next steps in the conquest of syphilis, according to Dr. Walter Clarke, executive director of the American Social Hygiene Association.

Evidences of interest in the forthcoming event, the third annual observance in the current attack on syphilis, point to a larger nation-wide demonstration than those of previous years, Doctor Clarke said. The Association's offices in New York as well as San Francisco report increased activity and interest on the part of official and voluntary health and welfare agencies, civic groups, service clubs, women's organizations, churches, schools, and upward of one thousand youth bodies.

Defining the objectives of the 1939 attack in terms of the slogan, these points were said to underly present national, state-wide and community planning in social hygiene:

Guard against syphilis by telling the American people about this dangerous disease—how it can be prevented and cured.

Guard against syphilis in youth, the age of greatest incidence, by strengthening the efforts of church, home, and school to provide better facilities for sex education, character development, and preparation for marriage; and by correcting community conditions which threaten the health and welfare of young people.

Guard against syphilis in marriage and childhood by encouraging good laws—and their observance—requiring examinations for all those about to marry and for all expectant mothers.

Guard against syphilis by attacking prostitution and quackery, two arch-accomplices of the disease.

Guard against syphilis by supporting adequate voluntary and official health programs, both state and local.

As in years past, press and radio aid will be sought in cultivating public interest in Social Hygiene Day and its objectives. The American Social Hygiene Association, 50 West Fiftieth Street, New York, is offering posters, envelope enclosures, a special tabloid newspaper for free mass distribution, and a complete kit of publicity and program aids for program planners.

The United States Public Health Service is again cooperating.

American Board of Obstetrics and Gynecology.—The general oral, clinical, and pathological examinations for all candidates, Part II Examinations (Groups A and B), will be conducted by the entire Board, meeting in St. Louis, Missouri, on May 15 and 16, 1939, immediately prior to the annual meeting of the American Medical Association. Notice of time and place of these examinations will be forwarded to all candidates well in advance of the examination dates.

Candidates for reëxamination must request such reëxamination by writing the secretary's office before the following dates: Part I—January 1, 1939; Part II—April 1, 1939. Candidates who are required to take reëxaminations must do so before the expiration of three years from the date of their first examination.

Application for admission to Group A, May, 1939, examinations must be on file in the secretary's office by March 15, 1939.

Application blanks and booklets of information may be obtained from Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh (6), Pennsylvania.

National Advisory Cancer Council. — Dr. James B. Murphy, Chief of the Cancer Research Division of the Rockefeller Institute, New York, and Dr. Mont Rogers Reid, Director of Surgical Service of the Cincinnati General Hospital and Professor of Surgery at the University of Cincinnati, were recently named as new members of the National Advisory Cancer Council for three-year terms.

The appointments were announced by Surgeon-General Thomas Parran of the United States Public Health Service, who is ex-officio chairman of the Cancer Council. The new members of the Council succeed Dr. Francis Carter Wood, Director of the Crocker Institute of Cancer Research, Columbia University, and Dr. James Ewing, Director of the Memorial Hospital, New York, both of whom were named as original members of the Council on October 16, 1937.

Continuing members of the Cancer Council are President James B. Conant of Harvard University, who is an authority on chemistry; Dr. Arthur H. Compton of the University of Chicago, a Nobel prize-winner in physics; Dr. C. C. Little, Managing Director of the American Society for the Control of Cancer; and Dr. Ludvig Hektoen of Chicago, former director of the John McCormick Institute for Infectious Diseases, who is serving as executive director of the National Advisory Cancer Council.

The Cancer Council shares with the Surgeon-General responsibility for the policies and activities of the National Cancer Institute Act, with particular regard to grants-in-aid.

"The National Cancer Institute Act is a new type of Government service for all the people," Surgeon-General Parran declared in commenting on appointments to the Council. "Through it the Government is able to offer concrete help, not only to the official agency, but also to the private scientific institution, or the accredited individual, in order to speed progress toward a scientific goal."

The stakes of victory against cancer are so high and the hope of every American family in that victory is so pathetically earnest, in the opinion of the Surgeon-General, that every effort must be made to close in on this enemy of mankind.

"The work of the National Cancer Institute is a test of the capacity of Government to lead through service. I believe that the results to date are showing additional evidence of the capacity of men of science to work together and profitably for the solution of their great common problems. In the Institute we have a new vantage point and a new hope of success for our attack on cancer," Surgeon-General Parran concluded.

Medical Vacancies in California.—There is a scarcity of medical men in California, so that is why the State Personnel Board let down the bars of residence requirements today as it sought to qualify some eighty professional men.

Instead of having resided in the state for one year, any man in the United States may take the examinations to be held on January 5, it was announced by Louis J. Kroeger, executive officer of the Board.

The state is seeking to qualify fifteen physicians and internists, ten eye, ear, nose and throat physicians, and twenty-five junior physicians.

Salaries ranged from $100 to $200, plus maintenance.—Pittsburgh *Post-Dispatch*, December 5, 1938.

California Leaders to Map Paralysis Drive.—With Joseph M. Schenck, Vice-President of the National Foundation for Infantile Paralysis and General Chairman for California, presiding, four hundred leaders in Southern California civic affairs recently assembled at the Biltmore Hotel for a luncheon at which plans were formulated for the infantile paralysis drive which starts in January.

Adding significance to the occasion will be the presence of several Northern California drive leaders, including Attorney-General-Elect Earl Warren, Chairman for Northern California; Mayor Angelo Rossi of San Francisco, Chairman for San Francisco, and George Baker, San Francisco director of organization.

Speakers will include Al Jolson, master of ceremonies; Mayor Fletcher Bowron, Louis B. Mayer, and Governor-Elect Culbert D. Olson. Also taking a prominent part in the plans will be Southern California drive leaders, headed by Joseph Scott, Southern California chairman; Sheriff Eugene Biscailuz, Los Angeles County chairman, and Prentiss Moore, Los Angeles City chairman.

Official announcement will be made at the luncheon of the new plan whereby 50 per cent of all funds raised by each community will remain in the community for local relief distribution.

The Advisory Committee for the drive includes Norman Chandler, Dr. Harlan G. Shoemaker, Victor H. Rossetti, Mrs. James K. Lytle, and the Right Rev. W. Bertrand Stevens, Episcopal Bishop of Los Angeles.

American Board of Ophthalmology.—The American Board of Ophthalmology announces an important change in its method of examination of candidates for the Board's certificate.

Examinations will be divided into two parts. Candidates whose applications are accepted will be required to pass a written examination which will be held simultaneously in various cities throughout the country approximately sixty days prior to the date of the oral examination.

The written examination will include all of the subjects previously covered by the practical and oral examinations.

Oral examinations will be held at the time and place of the meeting of the American Medical Association and of the American Academy of Ophthalmology and Otolaryngology, and occasionally in connection with other important medical meetings. The oral examination will be on the following subjects: external diseases; ophthalmoscopy; pathology; refraction; ocular motility; practical surgery.

Only those candidates who pass the written examination and who have presented satisfactory case reports will be permitted to appear for the oral examination.

Examinations scheduled for 1939—Written: March 15 and August 5. Oral: St. Louis, May 15; Chicago, October 6.

Applications for permission to take the written examination on March 15 must be filed with the secretary not later than February 15.

Application forms and detailed information should be secured at once from Dr. John Green, Secretary, 6830 Waterman Avenue, St. Louis, Missouri.

M. D. License Plates.—After January 1, New York State physicians will no longer need distinguish their cars by special insignia. Police and public alike will instantly be able to spot those devoted to medical duty by their license plates.

At the request of the State Medical Society, the Department of Motor Vehicles will make available ten thousand of these standard designations for the use of automobiling doctors. Replacing the ordinary plates, they substitute "M. D." for identifying letters; are numbered from one to 9,999. They entail no other cost than the usual license fee.

The plates are available only to active practitioners. Each applicant for them must be certified by a county medical society, whether he is a member or not.

Life Insurance Policies.—There are sixty-four million Americans wise enough to carry life insurance for the benefit of themselves or their dependents.

These policies average $1,725 each, showing that millions of small amounts are carried, as well as the immense sums for which the comparative few are insured.

These facts were reported at the convention of the Association of Life Insurance Presidents in New York recently.

This year, said Julian Price, Chairman of the Association, policyholders and beneficiaries will receive about $2,600,000,000 from the companies—$975,000,000 in death claims and the remaining $1,635,000,000 to living policyholders as matured investments, annuities, surrendered values, policy dividends, and disability payments.

By the end of the year it is estimated that the amount of life insurance in force will amount to the stupendous sum of $11,300,000,000—the largest amount in history.

That so many Americans are insured, and for so much, is a notable exercise of common sense on their part.

Stillbirths in California.—There has been a fairly consistent downward trend in stillbirths during recent years in California. In 1937 there were 2,130 stillbirths recorded, giving a rate of 22.6, which is the lowest stillbirth rate ever recorded in California. In 1936 there were 1,997 stillbirths recorded, giving a rate of 23.6 per 1,000 total births. In 1920 there were 2,059 stillbirths recorded, with a rate of 30.6.

The following table gives the number of stillbirths, together with rates from 1920 through 1937:

Year	Total Births	Stillbirths	Rate Per 1,000 Live Births
1920	69,257	2,059	30.6
1921	74,642	2,204	30.4
1922	75,541	2,220	30.3
1923	82,634	2,397	29.8
1924	89,488	2,589	29.8
1925	87,667	2,175	25.4
1926	84,690	2,318	28.1
1927	86,533	2,219	26.3
1928	86,063	2,420	28.9
1929	83,881	2,383	29.2
1930	86,809	2,427	28.7
1931	83,885	2,332	28.6
1932	80,261	2,153	27.6
1933	77,261	2,032	27.0
1934	80,316	1,874	23.9
1935	82,188	1,966	24.5
1936	86,457	1,997	23.6
1937	96,416	2,130	22.6

Although 88.8 per cent of the population of California, in 1930, consisted of members of the white race, they contribute a smaller proportion of both births and stillbirths. Mexicans, who, in 1930, constituted 6.4 per cent of the population, contribute almost 15 per cent of the births and 19 per cent of the stillbirths.

More stillbirths are recorded among males. During recent years, the average of males to females born alive is 105 to 100, but there are 128 males stillborn to each 100 females. While it is possible that some of these ratios may be changed, there is sufficient evidence to state that the ratio of males to females in California is higher among stillborn infants than among infants born alive.

Third International Cancer Congress.—This Congress will be held under the auspices of the International Union Against Cancer, in Hadden Hall Hotel, Atlantic City, New Jersey, on September 11 to 16, 1939.

Membership in the Congress is secured by application to the secretary-treasurer, with remittance of $15. Make checks payable to the Third International Cancer Congress and mail to Dr. Donald S. Childs, 713 East Genesee Street, Syracuse, New York.

Membership in the Congress does not include the right to present a paper unless the paper or an abstract has been submitted to and been approved by the Program Committee. All papers must be read in person by the author. In no case will a paper be accepted without an abstract. The Program Committee reserves the right to reject any paper without recourse. All papers and abstracts, as well as any questions pertaining to them, should be addressed to Professor Francis Carter Wood, President, Third International Cancer Congress, 630 West 168th Street, New York, N. Y.

Projection will be provided for lantern slides in the standard sizes, such as American 3¼ by 4 inches, English 3¼ by 4¼ inches, and Continental 8½ by 8½ or 9 by 12 centimeters. Facilities for the projection of 16 and 35 millimeters film will also be available. Projectoscopes for showing full size roentgenograms will be provided by the firms of Carl Zeiss and E. Leitz.

The proposed sections are as follows: General research; biophysics; genetics, general pathology of cancer; surgery; radiological diagnosis; radiotherapy; statistics; and education. Further details concerning section chairmen, committees, etc., will be announced later.

Experiments Show Hemorrhages Due to Calcium Lack.—The first recorded correlation of certain types of paralysis in animals to a calcium-deficient diet, is reported by the department of biochemistry of the University of California. The paralysis is of hemorrhagic origin, possibly akin to certain brain hemorrhages in man.

It has been known for some time that, with a low blood calcium, human subjects and many animal species develop the convulsive condition known as tetany. The more profound and complex condition of paralysis, however, has not been attributed to a deficiency of calcium heretofore, despite the fact that it has been observed often in nature, among browsing animals.

Nutritional surveys have shown that calcium is the most common deficiency in the American diet, and, as a result, scientists have concentrated on the study of this element for the past twenty years. It is most readily supplied by eggs, beans, milk, cheese, almonds, and a number of other food products.

The authors of the study observed that a profound neurological disturbance develops in growing rats maintained on diets very low in calcium, which had heretofore not been associated with a deficiency of calcium. The neurological picture, which is quite complex, is suggestive of a diffuse lesion involving the cortex, basal ganglia, spinal cord, and peripheral nerves. When the injury was not too advanced, recovery was hastened by feeding the animals a control diet.

The study was made by Dr. David M. Greenberg, Associate Professor of Biochemistry, Muriel D. D. Boelter, graduate student in biochemistry, and Dr. Benjamin W. Knopf, a physician. A report is to appear in the magazine *Science,* the official organ of the American Association for the Advancement of Science.

Better Education of Drivers and Road Etiquette at Base of Accident Prevention.—Universal adoption of a road etiquette that has in it certain well-justified taboos will probably do more to avert highway accidents than any means now being employed, Dr. Ray Lyman Wilbur, President of Stanford University, advises the California Safety Council.

In a safety message to President Fred D. Parr of the state-wide accident prevention agency, Doctor Wilbur, himself a Safety Council director, says:

"The history of mechanical contrivances in industry and in transportation is that they have always at the beginning had a high accident rate. With the application of safety devices and the education of employees, marked reductions in such accidents have been the rule. In connection with the high speeds possible with modern automobiles and modern roads there have been improvements in the brakes, in the steering devices, and in the durability of all parts of the automobile.

"There can still be marked improvements in the roads in the illumination of all highways, in automobile lights, signs, etc.; Doctor Wilbur continued, "but all of these will be futile unless the drivers can be trained. With a new crop of drivers each year, and with increasing consumption of alcohol, a continuation of the accident problem is inevitable. I think that we must attack every weakness, but particularly educate the drivers in the dangers involved. Also we must develop an etiquette of the road which will be universally accepted.

"Taboos have controlled human conduct for untold centuries. If we can get a road etiquette established that has in it certain well-justified taboos, I believe we can increase the safety of our highways materially."

Pneumonia Exhibit at Golden Gate International Exposition.—While men and women throughout the world celebrated another anniversary of a war armistice, scientists revealed completion of a brilliant "medical armistice" against pneumonia.

From officials of the Golden Gate International Exposition, announcement came that a New York laboratory has finally completed preparation of tested, effective antiserums for each one of the thirty-two types of pneumonia germs. The almost miraculous curative serums will be distributed this month to strategically placed depots throughout the United States.

San Francisco has been selected as one of these distributing centers.

The first public demonstration of the thirty-two antipneumonia serums will be made to the public next year in an exhibit sponsored by the Lederle Laboratories of New York for the San Francisco Fair's Hall of Science. This was reported by Dr. Milton Silverman, Director of the Hall of Science, following receipt of plans for the Lederle display.

"For centuries," Doctor Silverman said, "pneumonia has consistently ranked among the top four killers. Until only a few years ago, this terrible infection baffled scientists and physicians who attempted to find some curative method.

"Only recently, laboratories gave us the first hope that a serum might be able to battle pneumonia. The hope was pretty slim, since there are known to be at least thirty-two types of pneumonia germs, and each type requires a specific anti-serum."

In the last few months, it was pointed out, these specific anti-serums were developed for four types of pneumonia microbes, then seven, then eleven, and now, for all thirty-two.

It is expected development and proper distribution of the curative agents will cut pneumonia mortality down to nearly the vanishing point.

"Proper usage of the serums," Doctor Silverman emphasized, "depends almost entirely on coöperation between the physician and the patient. The longer the patient delays calling his physician the less the efficacy of the serum."

Other features to be presented in the Lederle exhibit next year include a demonstration of the cause, spread, diagnosis, and treatment of pneumonia, and a demonstration of the methods used to determine the type of a pneumonia infection and to select the proper serum.

Seek Law to Bar Epileptic Drivers from Highways. The state of California, through its Department of Public Health, is to inaugurate legal action to forbid the operation of motor vehicles by persons suffering from epilepsy, in an attempt to cut down the numerous accidents caused by physically unfit drivers. This was announced recently by Dr. Walter M. Dickie, Director of the Department, in a communication to the University of California Medical Center. According to Doctor Dickie, the legislation will be presented at the next session of the Legislature.

Under the present law it is not possible for any hospital or private physician to report cases of epilepsy to the department, although both are known to be receiving numerous complaints about epileptic drivers. According to a number of medical authorities, the epileptic in many cases is not aware of his condition. Cases have been known where the epileptic driver lapsed into unconsciousness at the wheel of a car, caused an accident thereby, and then recovered his senses without having been in any way aware of the lapse. It has thus been impossible to place responsibility for a number of accidents.

According to Doctor Dickie it is the plan of the department to have the reported cases submitted to the State Division of Motor Vehicles so that the division may have opportunity to keep a constant check on epileptic drivers. There is no intention on the part of the department to keep epileptics out of automobiles, he said, as such recreation may be beneficial to them. The only intent is to keep them from driving motor vehicles while suffering from their complaint.

Present motor-vehicle regulations provide that the applicant for a license must state whether he is suffering from a physical disability of any kind. But many epileptics either evade this or attribute their disorder to indigestion or other complaint in a nondisabling class, officials of the division say. There is no way to compel a correct answer, and some other means must be found for the state to meet the situation.

Initiative Costs in November Election Told.—Sacramento, December 9.—Nearly $1,000,000 was spent during the August primary and November general election campaigns in support and opposition to the twenty-five propositions appearing on the ballot, according to statements filed today with Frank C. Jordan, Secretary of State.

The exact amount expended was $945,063, with only a few small statements outstanding, Jordan reported.

Opponents to the Labor Initiative No. 1 on the November ballot spent $100,000, and organizations supporting the defeated measure expended more than $300,000, Secretary of State Jordan reported. . . .

Proposition No. 2

Chief expenditures against No. 2, the Humane Pound Act, were: B. C. Raulston, M.D., and George D. Maner, M.D., Los Angeles, $5,314; California Medical Association, $14,423; California Society for Promotion of Medical Research, $29,545. Favoring the Act were the California Citizens' Committee, $3,189; California Committee. $12,077. The Act was defeated.

Press Clippings.—Some news items from the daily press, on matters related to medical practice, follow:

Another Medical Initiative

Free Hospitals Sought

Creation of a state commission of nine members to control services in all state hospitals and physicians using them so the public can use them without charge is proposed in an initiative measure the Attorney General's office at Sacramento was yesterday asked to title.

Avery C. Moore of Berkeley, its sponsor, described it as a step extending "to the people of California the benefits of medical science along the same lines as educational benefits now being enjoyed."

Approval of the measure by the voters would entail an amendment to the state constitution and, in the event that should be forthcoming, Moore hopes to have the plan extended to private hospitals and physicians and service in private practice.

The manner of financing the suggestion was made that costs be budgeted by the Governor after a year's trial established actualities and estimates.

The commission, under the proposal, would have the power of regulation over all physicians, surgeons, osteopaths, chiropractors, and registered nurses.*

As soon as word of the proposal reached the Capitol, state officials expressed the conviction that it is entirely impracticable and can be expected to bring opposition generally from the medical profession.

Harry Lutgens, director of state institutions, said the seven state hospitals now are crowded to their capacity of 22,000 patients and have no room for more. He declared patients now pay an average of $20 monthly for treatment, which means an income to the state's general fund of about $4,000,000. The cost of maintaining the institutions, however, is $14,000,000 biennially, he said.

Dr. C. B. Pinkham, secretary of the State Medical Board, predicted "vigorous" opposition on the part of the medical profession.—San Francisco *Chronicle*, December 29, 1938.

Health and Pension Laws in Making

Two New Campaigns Begin for Social Legislation—Behind the Health and Social Security Reports—The Plans Congress Will Consider

The Government is moving forward on two fronts to extend social legislation.

More adequate health services and bigger and better social security are the two goals at which the Administration is now shooting.

The health program, which shortly will be presented to Congress in the form of an interdepartmental report, was drafted by a committee headed by Miss Josephine Roche and at the behest of President Roosevelt.

The proposed health program would do two things: Provide adequate medical care for those who cannot pay for it; and make medical services less expensive for those who can afford to pay a modest fee.

Cost of Free Care for the Indigent

To accomplish the first objective—free care for indigent persons—Miss Roche's Interdepartmental Committee report recommends that State and Federal governments embark on a ten-year joint program to cost the Federal Government $65,000,000 the first year and up to a maximum of $850,000,000 a year. Maternal and child care, better public health services and hospital facilities would be provided.

Simultaneously, the Government is urged to back voluntary health insurance plans. That the executive branch of the Government will not need to be urged very hard can be seen in the vigor with which the Department of Justice is pressing in a District of Columbia court charges of violation of the Sherman Antitrust Law against the American Medical Association, the Medical Society of the District of Columbia, other medical societies, and twenty-one prominent physicians. A grand jury has just indicted the societies and physicians, basing the indictment on alleged discrimination by the defendants against Group Health Association, Inc., a medical coöperative of Government workers. . . .

Extending Coverage of Social Security

Their report urges speeding up and increasing of old-age payments, broadening the act to cover 14,800,000 persons not included in the forty-two million who now are covered, and abolishing the $47,000,000,000 reserve fund. Widows and young children of annuitants, farm and domestic workers would be some of the new groups entitled to receive payments.

To pay the bigger bill, the Government would be asked to contribute one-third of the cost. The price of this expanded social insurance plan would be expected to absorb 10 to 12 per cent of national income in 1980.

If translated into law, these two new Government campaigns for social improvements may mean benefits to four of every ten persons in the country.—The United States *News*, December 27, 1938.

Illness Costs British Over Billion Yearly

London, December 3.—(UP)—Illness costs Great Britain about $1,415,000,000 a year.

Of this sum $250,000,000 goes to the doctors. There are about 17,500,000 person under the National Health Insurance plan, and their average time on the sick list is a fortnight a year. Treatments and maintenance costs account for the rest.

The nation spends $585,000,000 annually to prevent illness.—Seattle *Sunday Times*, December 4.

Behind the News*

Osteopath on Health Board, Final Merriam Fillip

Swiftie: Despite everything he has been through recently, Governor Merriam has just demonstrated that he can still wind up and pitch one right past the belt-buckle. To the State Board of Health Mr. Merriam has just appointed Dr. Norman F. Sprague of Long Beach. About this there would be nothing unusual except that Doctor Sprague is an osteopath. This, so far as our men can learn, is the first time an osteopath has ever crashed the line of the M. D.'s. So various members of the medical profession are just sitting back now, waiting for the riot to start.

But, because of the Governor's skillful manipulations, a riot is exactly what may not develop. Mr. Merriam, the best information is, was paying a political debt to the osteopathic group by giving it something called an opening wedge. Yet the man he picked is perhaps the last California osteopath the doctors of medicine would select for a target. Not only has he done the extra medical study required for an osteopath to obtain a physician and surgeon license, but he has softened up the opposition by the manner in which he has helped pioneer the osteopathic ward in the Los Angeles County Hospital.

Doctor Sprague was the first, or among the first, osteopathic physicians admitted to the hospital after a thunderous battle between the two schools of practice which took place in the South several years ago. Apparently he did a very successful job there as an opening wedge—without rousing the ire of the M.D.'s. However, the sky may not remain too serene—provided the "regular" doctors can figure out something to do about it.

The appointment means a hearty chuckle through the Olson camp, because preëlection sentiment among the doctors of medicine—no mean political group—was definitely pro-Merriam. The Governor handled that situation nicely, too. He early told the medical men he was considering the appointment of an osteopath—and just let them think he was joking.

* * *

Merriam: As he steps out on this day when California has one governor for the forenoon and another for the p. m., we wish a belated happy new year to Governor Merriam. He has given us plenty to write about, for he has been preëminently a politician—and politics, like icebergs, whales, and the bottom of the ocean, are mostly under the surface. But there has been one thing about this governor of the forenoon—right or wrong, nobody could push him around. He listened to his advisers and then did as he pleased. And, although he was elected to get an entirely different sort of governor, the governor of the afternoon seems, in that regard at least, to be another piece off the same bolt. He doesn't push easy, either. A happy new year to him, too.

* * *

Medical Corps Tests

An examination to qualify candidates for appointment as first lieutenants in the Medical Corps, regular army, will be held on March 20-24, 1939, inclusive, the War Department announced yesterday.

The examination will be open to male graduates of acceptable medical schools who have completed one year's interneship and will not be over thirty-two years of age when commissions are tendered. Medical officers throughout the country will conduct both physical and written examinations. The Adjutant General, War Department, Washington, will furnish full information and application blanks.

* * *

Compulsory Marriage Examinations Sought

Compulsory examinations before marriage and tests of prospective mothers are the objects of two measures framed for consideration at the forthcoming session of the California Legislature, according to Miss Eloise A. Hafford, executive secretary of the Southern California Society for Control of Syphilis. Sixty thousand children were born last year afflicted with syphilis, she reports from national figures.

Miss Hafford will leave tonight for Sacramento for the purpose of promoting the two measures. She will be located at the Land Hotel, where she will remain until the solons complete work on the bills. She resides at 735 North Los Robles Avenue.

---

*Editor's Note.—County hospitals are supported by public funds, not from state but from county sources. Public funds raised by county taxation remain under the sole jurisdiction of county boards of supervisors, hence county hospitals remain under the sole control of county authorities. A plan for a commission to "regulate physicians" (whatever that may mean) is also something new.

* With Arthur Caylor, in the San Francisco *News*, January 2, 1939.

According to Miss Hafford, ten states already have enacted laws regulating premarital tests and fifteen legislatures will give consideration to similar measures at the coming sessions. The proposed California legislation has been given wide support, it is stated.—Pasadena *Star-News*, December 31, 1938.

* * *

California Sterilization Law Change Urged

Sacramento, December 29—(INS).—Legislation to provide sterilization for certain inmates of California prisons was recommended in Sacramento today in the biennial report of the State Board of Prison Directors.

The recommendation was made by Dr. L. L. Stanley, chief surgeon at San Quentin, and who declared "the law in effect at the present is inoperative because of the numerous provisos it contains."

It was recommended by Doctor Stanley that legislation be enacted so prisoners may be sterilized under the following conditions:

1. Men with diseases which may have been inherited and are likely to be transmitted to descendants.
2. Feeble-mindedness in any of its various grades.
3. Perversion, or marked departure from normal mentality.—Los Angeles *Evening Herald and Express*, December 29, 1938.

* * *

Roosevelt Revives Reorganization Bill

Washington, December 8.—(INS)—President Roosevelt's program for reorganization of the Federal Government—a major New Deal proposal which met stunning defeat in the last Congress—was brought to life today in a conference at the White House.

The President called in Louis Brownlow, Charles E. Merriam, and Luther Gulick, the three advisers whose survey formed the basis for the Administration's reorganization recommendations.

With Roosevelt, the conferees debated how reorganization proposals might best be presented to the Congress convening in January.

The conference presumably explored future strategy, with particular attention to the recent election returns. In view of important Republican gains in both branches, opposition to the program may find new recruits.

With the possibility that today's conference may convince the President that another attempt should be made to put the reorganization bill through Congress, observers on Capitol Hill foresaw a long and bitter fight.

New Cabinet Officer: Department of Public Welfare

One of the most controversial features of the original bill was the establishment of a new cabinet post—Secretary of the Department of Public Welfare, under whom all welfare agencies of the government would be grouped. WPA Administrator Harry Hopkins was talked of for this post.—San Francisco *Call-Bulletin*, December 8.

* * *

Associated Farmers of California Act to Form National Group

Ventura, December 10.—(AP)—The Associated Farmers of the Pacific, fighting efforts to establish a closed shop on American farms, moved today toward national expansion of the organization.

A committee of farm leaders from western and midwestern states, named at the concluding session of the organization's first annual convention, will direct establishment of the enlarged unit.

Appointed to the group by Col. Walter E. Garrison of Lodi, retiring president of the Pacific group, were:

Holmes Bishop of Orange, president of the Associated Farmers of California; W. F. Schilling, Northfield, Minn.; Leo W. Lighter, Kenosha, Wis.; S. C. Arnold, Broadview, Mont., and J. C. Wilson, Phoenix, Ariz.

H. L. Shumaker of Hood River, Ore., was chosen to succeed Garrison.—San Francisco *Examiner*, December 12.

* * *

Farm Industrialization Swells Labor Demand

Fresno, December 10.—(AP)—Omer Mills, regional economist for the Farm Security Administration, speaking at the California Conference on Migrant Education here today, said the high degree of industrialization which characterizes California agriculture largely is responsible for the demand for large numbers of agricultural laborers in this state.

"Twelve per cent of California's farmers employ 78 per cent of the labor," said Mills. "These large-scale operations create the need for a large number of workers, with the result that 60 per cent of the rural population are wage-earners employed by the big operators.

"These workers are out of a job a large part of the time, with various government agencies carrying the load between peak employment periods."

Mills declared there is a decided surplus of labor in the state. He recommended removal of a part of the surplus by employing these workers on conservation projects.

Agriculturists themselves have begun to realize the problem created by specialization, he said, and revision of the cropping pattern was discussed at a recent convention of the Associated Farmers. The need of teaching migrant workers the fundamentals of sanitation and hygiene was emphasized by Edward A. Brown, supervisor of camp inspection of the Division of Immigration and Housing.

The influx of migrants has resulted in an increase in pellegra, malaria and smallpox in California, said Dr. Ellen Stadtmuller, chief of the Bureau of Child Hygiene of the State Department of Health.—San Francisco *Examiner*, December 12.

* * *

Interference in Business Scored

Washington, December 8.—(INS)—A member of the joint antimonopoly committee, Senator King, Democrat of Utah, today declared a frank announcement by the New Deal "that it will stop interfering with business would do more to bring about recovery" than the inquiry into the nation's economic structure which the committee is conducting.

"There could be no greater contribution to revival of business," he asserted, "than an unmistakable announcement the government is not going to intervene in matters which belong to private endeavor; that it is not seeking to take industries over, but that its rôle is the one of coöperation and aid.

Fears Cited

"There is no doubt but what business men have been afraid of punitive legislation, of government entering fields that should be occupied by individuals, and afraid of burdensome taxation.

"If business could feel that government truly desires to aid in every proper way, not by bounty or gift, but by sympathetically approving those relations necessary between capital and government, you'd find, I think, the touchstone to a remarkable recovery." . . .—San Francisco *Call-Bulletin*, December 8.

* * *

Influenza: $20,000 Given New Germ Laboratory

Pacific Coast scientists will open a new attack on influenza germs in February in a State Public Health laboratory built and supported by the Rockefeller Foundation.

Dr. Walter M. Dickie, state health director, announced the Foundation had granted $20,000 to pay for a state laboratory now being built near the University of California campus in Berkeley.

Addition of a Berkeley laboratory to another already established in Minnesota is expected to help discover what geographical differences there may be in influenza virus.

Thus far scientists have isolated at least four strains, and Doctor Dickie said studies already made indicated the virus which caused the California influenza epidemic of 1936 was different from that which affected many persons on the Atlantic Coast that winter.

Ultimate goal of the coördinated laboratories is the isolation of as many strains of the virus as possible in the hope of developing from them an immunizing substance effective against a maximum number of the varieties involved.

The virus is known to build up "antibodies" or immunizing substances in the individuals affected. These antibodies protect the person for a time against an attack by more viruses of the same strain, although not necessarily against viruses of another type.

* * *

Animal Experimentation and Scientific Medicine Endorsed by Voters

The voters of California and Colorado, November 8, by overwhelming majorities emphatically rejected proposals made in those states to undermine the structure of scientific medicine, *The Journal of the American Medical Association* for November 19 says. In California an initiative humane pound law, so called, proposing to cripple scientific research by hampering animal experimentation, was decisively defeated. In Colorado an initiative measure proposed by a group of chiropractors, to debase the quality of medical care in the state by repealing the basic science act and by destroying other safeguards that have been erected to assure adequate and scientific medical service, was met by an avalanche of negative votes, running as high as 10 to 1 in some counties.

In Oklahoma an initiative measure that would have sanctioned practices not conducive to public welfare failed to get on the ballot, because of court action instituted by the medical profession. In Ohio a chiropractic initiative somewhat similar to the Colorado initiative died aborning, the cultist sponsors apparently becoming disheartened shortly after the proposal was submitted to the attorney-general for his approval as to form. Petitions in Ohio were not circulated and the proposed initiative measure was not submitted to the people for a vote.

The medical associations in the states named assumed the lead in thwarting the selfish interests behind these proposals, interests that would subordinate the public welfare to their own private ends. In California and Colorado the state medical associations, aided by many lay and other professional groups and by public-spirited citizens, informed the people fully of the dangers implicit in the proposals. To bring these dangers to the attention of the voters necessitated great sacrifices of time and money, but the results show that such sacrifices were well worth while and indicate that an informed electorate will support scientific medical care under proper legal and ethical safeguards. —*American Medical Association News Sheet.*

U. S. Migratory Aid Sought

Allocation of more federal funds for medical aid to California's thousands of migratory workers was urged yesterday by Dr. W. M. Dickie, director of the State Department of Public Health.

Present facilities, he said, are limited to the low available funds and man-power of his department and the Federal Farm Security Administration. He continued:

"Medical needs of these migratory workers showed an increase during November and will mount through the winter months. Additional provisions must be made for them. At the same time, the general public must be protected from the danger of contracting infectious diseases from them."

A major difficulty, Doctor Dickie declared, is the fact that a vast majority of the migratory workers lack the residence requirements to make them eligible for aid from local health departments.—San Francisco *Chronicle,* December 22.

* * *

Democrats Map Health Plan

Legislature to Get Administration Program

Examiner Bureau, Sacramento, December 19.—Lieutenant-Governor Ellis E. Patterson said the new Democratic administration will submit a quasi-State health insurance program to the 1939 Legislature.

After studying newspaper accounts of the plan proposed at a Los Angeles meeting of the California Medical Association, Patterson indicated the Association's plan does not fully meet ideas of the incoming administration.

The administration program, instead of allowing eligibles a salary maximum of only $2,500 annually, would admit persons with incomes up to $5,500 and include a provision for care of indigents and unemployables, he indicated.

He said the party is committed by its platform to a state plan, expressing the belief that California physicians attempting to operate a "closed corporation" plan eventually would ask the state to take it over.—San Francisco *Examiner,* December 20, 1938.

* * *

Sprague Appointed to Health Board

Sacramento, December 24.—(AP).—Dr. Norman F. Sprague, Los Angeles, was appointed today by Governor Merriam to succeed Dr. George H. Kress as a member of the State Board of Health for a term ending January 15, 1941. Doctor Kress resigned on July 1, 1938.—Los Angeles *Times,* December 23, 1938.

* * *

Spirit of Labor-Capital Coöperation Seen in Program at Forthcoming Session of Legislature

Indications that a broad spirit of coöperation between capital and labor will be evident in the program if the State Chamber of Commerce decides to support at the forthcoming session of the Legislature marked initial meetings of the organization in the Fairmont Hotel yesterday, as the thirteenth annual convention got under way with more than 1,000 delegates registered. . . .

Coincidentally, directors will have the following recommendations before them: . . .

Prepare statistics on unemployment compensation, old age insurance, health insurance, so California may move intelligently for or against any law governing them. . . .—San Francisco *Chronicle,* December 2, 1938.

* * *

Nonpartisan League Will Back State Health Insurance Measure

With the opening of legislative headquarters here, J. Vernon Burke, secretary of Labor's Nonpartisan League, announced today that the organization will sponsor a state health insurance measure at the coming session.

While Burke said financing plans have not been developed, it has been suggested that the money be raised by a payroll levy. Both California residents and migratory workers would be eligible for benefits. . . .—Sacramento *Bee,* December 15, 1938.

* * *

Medical Insurance Arrives

The campaign for medical insurance, which farmers have been waging in California, is now bearing fruit.

The California Medical Association has gotten a "divorce" from Dr. Morris Fishbein, secretary of the American Medical Association, who has been leading the fight against "socialized medicine," and the California group announces a health insurance plan which sounds practical, and humanitarian.

Details are not complete, but the California Medical Association proposes to set up a service by means of which citizens may pay a flat rate per month and go to the physician, surgeon or hospital of their choice for needed attention. This service is to be furnished by the members of the California Medical Association, who comprise about 90 per cent of the leading doctors of the state, and they will be reimbursed from the state insurance fund. The fund is to be non-profit, the monthly payment for the service to be based on the actual cost, as experience may reveal.

An effort to get the Dental Association to coöperate was not successful. Perhaps this may come later.

If the plan is carried out on the broad basis on which it is visioned, this will avoid state medicine and political control. It does not require any additional legislation, or extra equipment.

This is the sort of service the farm groups have asked for. They wanted to pay to be kept well, and be able to budget the necessary expense. This does not interfere, of course, with free medical service for indigents, nor does it put any compulsion on those fortunate citizens who do not have to worry about the cost of medical service, and may prefer to leave it to chance. But to a great many homes it will be welcome relief.

Thus the Medical Association is to be congratulated for meeting the request of agriculture.—*Pacific Rural Press* and Petaluma *Argus-Courier,* November 28, 1938.

* * *

The California Farm Bureau Federation, with enlarged membership and new hope, met in its twentieth annual convention at Sacramento last week and adopted a broad work sheet for the future. . . .

The Farm Bureau has deposited in its new home at Berkeley a membership roll covering 23,129 farm families.

The convention rejoiced that the California Medical Association has agreed to furnish health insurance, and it renewed its demand that county hospitals be opened to paying patients.

Over 1,800 delegates from all over the state registered at the convention and visitors from many other farm groups participated in the discussions of the program ahead.

Farmers seek to do their part.—*Pacific Rural Press,* November 26, 1938.

Ballot Expenses Listed

Three Hundred Thousand Dollars Spent Vainly to Pass Initative No. 1 on Labor

Sacramento, December 12.—(UP).—Opponents to the Labor Initiative No. 1 on the November ballot spent about $100,000 and organizations supporting the defeated measure expended more than $300,000, Secretary of State Frank C. Jordan reported this week.

More than fifty organizations and individuals have filed financial reports with Jordan, as required by law. . . .

Chief expenditures against No. 2, the Humane Pound Act, were: B. C. Raulston, M. D., and George D. Maner, M. D., Los Angeles, $5,314; California Medical Association, $14,423; California Society for Promotion of Medical Research, $29,545. Favoring the act were the California Citizens' Committee, $3,189; California Committee, $12,077. The act was defeated. . . .—Santa Cruz *Sentinel,* December 13, 1938.

* * *

Socialized Legal Aid League Forms in State

Sacramento, December 22—(INS).—Socialized legal aid for the poor and middle-class citizens of California was proposed in Sacramento today when the "Socialized Law League" filed articles of incorporation with Frank C. Jordan, Secretary of State.

The League, which proposes to create a "socialized law commission" of five members, plans to seek legislative approval of the plan, and, in the event of failure, place the matter before voters of the state in the form of an initiative measure.

The socialized law, Lieutenant-Governor Ellis Patterson said today, would be supported by the Democratic contingent in both houses if the bill is properly drawn.

He likened socialized law to socialized medicine, picturing a great need for both as arms of state government.

He said the people needed this protection so that the poor might stand on an equal basis with the rich before the bar of justice.—San Francisco *Call-Bulletin,* December 22, 1938.

* * *

United States Recognizes State Problem

Washington, December 19—(AP).—Government experts reported today that along with a big increase in agricultural employment since 1910, California had acquired a "serious" migratory labor problem.

Summarizing results of a nation-wide survey, they informed Works Progress Administrator Harry L. Hopkins the state's farm labor force increased from 211,898 to 300,105 in the period from 1910 to 1935, and added this comment:

"The organization of agriculture in California is somewhat different from that in other areas, being characterized by a high degree of specialization, the cultivation of intensive crops which have high seasonal labor demands, the presence of many large farming units, and a high degree of mechanization.

"The proportion of the total labor force composed of hired workers is distinctly greater than the remainder of the country. Further, this proportion has increased somewhat throughout the period studied."

In 1910, the experts reported, 102,764 of the 211,898 persons employed in agriculture were "family workers," while the rest were hired. By 1935 there were 172,232 family and 127,873 hired workers.—San Francisco *Chronicle,* December 19, 1938.

* * *

Aid on Migrant Health Sought

State to Request Added Federal Assistance to Meet Farm Worker Problem

In view of the impending session of Congress and health conferences in Washington, Dr. W. M. Dickie yesterday began a campaign for more public health and medical assistance for migratory workers from the Federal Government.

The State Health Director pointed out that increased assistance is vital not only to relieve the ills of migrants and their families, but also to protect the general health of Californians.

"California is now approaching the peak of the migratory labor problem," Doctor Dickie announced. "Applications for medical aid may be expected to mount during the winter months."—San Francisco *Examiner,* December, 22, 1938.

* * *

Drop Noted in Number of Migrants

Only 1,302 in Need of Work Entered State Last Month, United States Reports

The Farm Security Administration today reported 1,302 out-of-state families "in need of manual employment" entered California during November, 1938, as compared with 2,132 families during November, 1937.

Jonathan Garst, regional director of Farm Security Administration, said the figures were based on a survey by the agricultural plant quarantine border stations.

A "family" consists of 4.65 individuals, according to Farm Security Administration calculations.

"The records only show workers entering California," Mr. Garst said, "and take no account whatever of those leaving the state. There is, of course, a very considerable flow of such families leaving California."

Since June 1, 1935, 60,759 families in need of manual employment have arrived in California from out of state by auto. The decrease in numbers crossing the border has been sharper since April, 1938, than at any time since the border count was started.

"The decrease can only be ascribed to the fact that there was not work available in California," Garst said.—San Francisco *News,* December 26, 1938.

* * *

Health Group Files Appeal*

The Pacific Health Corporation, a San Francisco group health association, yesterday appealed to the United States Supreme Court from a State Supreme Court decision that it practiced without a licence.

By selecting physicians to administer to its members the health organization actually was practicing medicine in violation of the state's medical practice act, the State Court held.

In asking the high tribunal to void the decision, the corporation, according to Associated Press dispatches from Washington, D. C., did not question the validity of the California law in so far as it prohibited any unqualified or unlicensed physician from practicing medicine.

The appeal was the second development in two days in the fight over group health. Tuesday the Department of Justice obtained indictments against the American Medical Association, three affiliated societies and twenty-one physicians on a charge of violating the antitrust laws.—San Francisco *Chronicle,* December 22.

* * *

San Francisco City Health Service; Doctors Paid in Full

The City Employees' Health Service System completed its October business yesterday by mailing the last check to doctors on its panel.

All bills were paid at the full rate of $1.00 per unit, according to Jesse C. Cameron, System secretary. Checks totaling $13,433 were sent to 342 of the approximately one thousand physicians coöperating with the health insurance plan.

The month's operations left a balance of $701 in the medical fund and $577 in the administration fund, though the System was under heavy expenses for equipment and installations.

A rush to enroll dependents before the November 15 deadline for acceptance of new members without medical examinations brought the total membership as of December 1 up to 14,853, of whom 9,615 were employees and 5,238 dependents. October membership fees, deducted by the controller, amounted to $26,217, those for November, $30,735.—San Francisco *Chronicle,* December 8, 1938.

* * *

Doctors Paid $13,433 Under San Francisco Health Plan

Surplus of $1,278 Left After Payments for October

Checks totaling $13,433 were in the mails today—on their way to 342 physicians in the city—as payment for services rendered during October to city employees and dependents, under the city's health service plan.

After payment of the medicos, plus hospital and laboratory costs amounting to $4,323, a surplus was left of $1,278, to carry over.

Income Increases

Meanwhile, income of the health service increased during November to approximately $26,000, owing to a sizable increase in number of members.

Under new regulations in effect November 15 it became necessary for dependents of city employees, desiring to join the service, to undergo physical examinations. In the two weeks prior to examinations becoming mandatory, numerous wives, husbands, fathers and children signed up.

2,050 New Members

Total new members in the "health club," from September 21 to November 15, was 2,050. At the present time 9,675 city employees are in the group, and 5,238 dependents.—San Francisco *Call-Bulletin,* December 8, 1938.

* * *

Newspapers Pledge Support to Eaton*

Pledges of coöperation and fair treatment in interpreting his acts in Congress were given Representative-elect Tom Eaton yesterday by newspaper editors and publishers of the Eighteenth Congressional District at a farewell luncheon at Lakewood Country Club. After the luncheon Eaton and his family departed by auto for Washington.

Twelve publishers representing sixteen of the twenty-two newspapers in the district engaged in a frank discussion of local problems and issues. All offered full support of the new Representative.

Efforts to prevent the seating of Eaton next January 3 were condemned by Carl Fletcher, former Mayor of Long Beach and editor of the *Labor News,* who termed the tactics of certain groups in attempting to make a political target of Eaton as unfair and poor sportsmanship. He desired to go on record publicly, he said, against such maneuvers and also opposed the move to contest the election as threatened by the outgoing Representative.

Fletcher's remarks were considered significant in view of his opening statement that his paper had supported Eaton's opponent during the recent campaign.

Joe D. Williams, publisher of the Bellflower *Herald-Enterprise* and also a supporter of Representative Scott in the campaign, said that he felt it his duty now to give his fullest coöperation to the successful candidate. — Long Beach *Press.*

Congressman Scott Files Vote Contest

Washington, December 27—(AP).—Congressman Byron N. Scott (D.) of the Eighteenth California Congressional

---

* For text of the California Supreme Court decision see CALIFORNIA AND WESTERN MEDICINE, October, 1938, page 306.

* Congressman-elect Eaton of the Long Beach-Los Angeles County district defeated Congressman Byron Scott. Congressman Scott was the sponsor of the bill in the last Congress to investigate the American Medical Association.

District, filed an election contest today against Mayor Thomas Eaton of Long Beach, his Republican opponent who defeated him by 326 votes.

The contest was filed with the contest election committee of the House of Representatives. Scott's representative here said notice of the contest was served in Decatur, Illinois, yesterday on Eaton by the Sheriff of Macon County.

Scott's twenty-five point complaint charges, among other things, violation of the Califorinia election laws and corrupt practices act.—San Francisco *Chronicle*, December 28, 1938.

* * *

Postgraduate "State-wide" Medical School Planned

California's doctors will go back to school next year to keep pace with rapid developments of medical science.

The "school" will be taught by specialists and instructors from California's four medical colleges, who will travel to cities outside the metropolitan areas under a five-year plan of postgraduate study announced here today by the California Medical Association.

The purpose of the plan, explained by Dr. John C. Ruddock of Los Angeles, chairman of the Committee on Postgraduate Activities, is to enable physicians who can't continue their studies at the medical schools to learn about new developments, new techniques and new drugs.

"It enables the practitioner," Doctor Ruddock said, "to remain abreast of scientific progress and to apply in his daily practice the newer procedures with an understanding of their underlying principles and fundamentals."

Suggested educational centers were Stockton, Fresno, Riverside, San Bernardino, San Diego, Santa Barbara, San Jose, Santa Rosa, and Sacramento. The committee contemplated forming teams of clinicians to conduct series of conferences in more distant Northern California cities.

Dr. George H. Kress, Secretary of the Association, said the committee hopes to have the plan under way before spring.—Los Angeles *Herald and Express*, December 19.

* * *

How Prepayment Hospitalization Works

Health . . . Lots of folks we know in Lodi are members of hospital associations. For a small monthly fee—a dollar and up—they are entitled to hospital care, medicines, operating room, dressings, x-rays and the like. You can even have a baby produced at the hospital and cared for, all for the monthly fee. But married couples can't decide to have a child and then cash in on the policy. Must be a member for several months before assuming blessed parenthood. A man our hospital scout knows was badly smashed up in a car accident, along with another fellow. Our scout's man had a policy, but the other victim was on his own. Both were cared for, and three weeks passed before they were discharged. The policyholder didn't pay a nickle for his care; his partner in pain wrote a check for $112 to cover his bills. Pays to have a policy, what?

Expensive . . . A national survey just released tells you about the high cost of illness. Every day in the year an average of four million folks are hit by illness. The cost of sickness and the premature deaths in this nation is ten billion dollars a year. A staggering sum, indeed.

Deaths . . . The survey shows that infant detaths can be reduced by one-half. Every year there are two million babes born here. And one million babes never survive. This is just plain murder when you know that the million little folks would live if they had good care. One million infants are in families either on relief or who have an annual income of less than $1,000. If these families were enabled to take out hospital policies, see what a difference it would make in the mortality rate.

Relief . . . There is now a movement to fix up a deal for the poor folks so they can have advantage of hospitals and doctors. It will require a staggering sum to care for the million babes that die each year. Far better to cut out some of this WPA spending and put the money where it will at least give poor folks an opportunity for good health and insure life to their babies. The poor we will always have with us. The most we can do is to keep them healthy. They can find their own happiness.—Lodi *Times*, December 7, 1938.

* * *

County Extends Quarantine in Rabies Drive*

More Poundmen Hired; State Threatens to Kill Stray Dogs

Faced with the most serious rabies menace in the history of Santa Clara County, the Board of Supervisors yesterday widened the quarantine to include all unincorporated areas and increased the field force of poundmen to six and trucks to three.

If rabies is not stamped out here within sixty days by these measures, Santa Clara County is in danger of having the state take over the situation with "shot-gun squads who will shoot stray dogs and cats on sight," according to Supervisor Joseph M. McKinnon.

"We hope the public will coöperate with county officers during the next sixty days in helping eradicate rabies, because we don't want drastic action taken," McKinnon said yesterday.

The supervisors voted yesterday to widen the quarantine and increase the field staff, after County Health Officer C. M. Burchfiel, meeting with the Board in executive session, stressed the seriousness of the rabies situation.

The quarantine formerly covered the northern part of the county, but stopped short at Edenvale. Rabies is rapidly increasing in southerly areas, according to Doctor Burchfiel, who reported six new cases in the Gilroy-Morgan Hill district since December 1.

The six men and three trucks were voted by the supervisors for a period of sixty days. Formerly the county health office had at its disposal one full-time and one half-time field man, and one and a half trucks.

Doctor Burchfiel's recommendations to the supervisors followed the visit of Edward Ross, chief of the State Bureau of Sanitation in the State Department of Public Health, here last week.

Ross said he believes the rabies situation in this county constitutes a serious menace to the public health," Burchfiel said. "Unless the public will coöperate with the health authorities and police in combating the scourge, sooner or later human lives will pay for the public's apathy," Ross declared.

If the state takes over the extermination of rabid animals, the expense of the drive will be charged to the county, Burchfiel added.

The county quarantine does not include incorporated areas such as San Jose and Palo Alto, which have their own quarantines.

Appearing before the supervisors at an earlier meeting yesterday, Mrs. Frank Thomas of Palo Alto, state humane officer, proposed that the Board assess a license fee of $1.00 for male dogs and $2.00 for females in unincorporated areas.

"The adoption of some kind of restrictive ordinance, one imposing a tax on all dogs, would give enforcement officers weapons to work with, and the poorer sections of all communities, which are usually hotbeds of propagation, would be cleaned up," Mrs. Thomas said in a letter to the Board.

The Board filed the letter for future consideration.—San Jose *Mercury-Herald*, December 13, 1938.

Merriam Attends Napa Medical Party

Napa (Napa County), December 10.—Governor Frank F. Merriam is scheduled to be one of a score of honored guests who will be present at the Napa Valley Country Club tonight when the Napa County Medical Association holds its annual Christmas Jinx.

More than one hundred doctors and their guests, coming from all parts of the north bay district, will attend, according to Dr. George I. Dawson, chairman.

Among the guests attending will be:

Harry Lutgens, State Director of Institutions; Dr. F. O. Butler, Director of the Sonoma State Home; Judge Percy S. King of Napa; Dr. Junius B. Harris and Dr. Roy Green, both of Sacramento; Assemblyman Ernest C. Crowley; Senator H. W. Slater of Santa Rosa; Assemblyman H. B. Scudder of Sebastopol; Senator Thomas Keating of San Rafael; Dr. S. S. Bogle of Santa Rosa; Dr. L. L. Stanley of San Quentin Prison; Dr. Henry S. Rogers, Councillor of the Northbay District of the California Medical Association, and many others from Northern California.

Each year the Medical Association, headed by Dr. Walter Rapaport, of the Napa State Hospital, stages the annual jinx.—Sacramento *Bee*, December 10, 1938.

* * *

Medical Meeting in Mendocino County

Ukiah, December 9.—A dinner meeting of the Mendocino-Lake Medical Association will be held at the Mendocino State Hospital, Saturday evening.

Dr. George H. Kress, Secretary of the State Medical Association, will speak on medical insurance, and Dr. William Shepherd of the Metropolitan Life Insurance Company will show films on pneumonia.—Santa Rosa *Republican*, December 9, 1938.

* * *

Hospital Executive Meet

J. O. Thorpe, general manager of the Intercoast Hospitalization Insurance Association, returned tonight from a conference with executives of the three California nonprofit hospital service plans, which was held at the California Club in Los Angeles. The other two plans are the Insurance Association of Approved Hospitals in the San Francisco bay area and the Associated Hospital Service of Southern California.—Sacramento *Bee,* December 5, 1938.

Physical Examination Law In Oregon Slows Up Cupid Trade*

Portland, Oregon, December 11. — Poor Dan Cupid is mighty near bankrupt in the Oregon branch of his business. It wasn't bad management, either.

Dan was doing all right until the high cost of marriage began before the license could be issued.

Not that romance is dead. Heaven forbid! It's just that a trip to bordering state is no more expensive than the medical examinations now required in Oregon.

One prospective bridegroom struck the attitude of most Oregon couples when the Multnomah County license clerk told him what permission to wed would cost. "The h— you say," he muttered, and backed hastily through the door.

A new law, which went into effect a week ago, stagnated the wedding business. It requires physical examinations and Wassermann tests for men and women alike, for which physicians may collect $10 from the couple.

That isn't all. Licenses may be refused if parents or grandparents were afflicted with "epilepsy, feeble-mindedness, insanity, drug addiction or chronic alcoholism." Possession of a venereal disease is an absolute bar.

After the sworn statement of the applicants and physician are recorded, the couple still has to wait three days for a license—a holdover from an earlier law—and then pay $3.00 for it. That doesn't include the minister's fee.

Margaret Klees, Multnomah County license clerk, found some consolation in the situation, despite the fact that she could issue no licenses for several days because the prescribed blanks were not available.

"Most couples seem prepared to pay the price," Mrs. Klees commented. "If they can't, they shouldn't be getting married anyway."

One question bothered her.

"Where are you going to draw the line in refusing licenses?" she demanded. "Lots of people have been treated for insanity, but have completely recovered. I know lots of men who could be called chronic alcoholics, but they handle their businesses successfully and are highly intelligent, desirable citizens. Where do their children stand?"

Mrs. Klees thinks the law will work "when people get educated to it."

Meantime, Vancouver and Walla Walla, Washington, just over the Oregon border, Western Idaho, Nevada, and California points are doing a rushing business—even though California requires a three-day wait for a marriage license. —San Jose *Mercury-Herald,* December 12, 1938.

First Flea Lab Near Opening

A two-story building dedicated to study of the lowly flea was near completion today at the University of California Medical Center, the first flea laboratory in the world.

Dr. Karl F. Meyer, superintendent, said the new laboratory will be used for beginning of highly important pioneering studies into sources of bubonic plague among animals and other problems.

City dwelling two-bit flop house fleas are not the problem, Doctor Meyer said. It's their second cousins which infest squirrels, chipmunks and other wild life that are the disease carriers.—San Francisco *Call-Bulletin,* December 13, 1938.

Merriam Attends "Christmas Jinx" of Medical Group

The "Christmas Jinx," annual affair sponsored by the Napa County Medical Association tonight at the Napa Valley Country Club, will be attended by Governor Frank F. Merriam as one of the score of distinguished guests to join in the holiday fete.

More than one hundred doctors and their guests are expected to attend the stag affair, which is held under supervision of Dr. Walter Rapaport of Napa State Hospital, President of the County Association. Dr. George I. Dawson, chairman of the evening, announced that there will be no speakers, since the program is purely social.

Among the many distinguished guests who will be in attendance are Harry Lutgens, State Director of Institutions; Judge Percy S. King, Dr. F. O. Butler, Director of Sonoma State Home; Assemblyman Ernest C. Crowley, Senator H. W. Slater of Santa Rosa, Assemblyman H. B. Scudder of Sebastopol, Senator Thomas Keating of San Rafael, Dr. S. S. Bogle, Santa Rosa; Dr. L. L. Stanley, San Quentin Prison; Dr. Henry S. Rogers, Councilor of the Northbay District of the California Medical Association; Dr. Junius B. Harris and Dr. Roy Green, both of Sacramento.

Feature of the evening's entertainment will be the appearance of the Medical-Dental band of eighteen pieces, who will come from Oakland for the evening. Professional entertainment will also be on hand for the program. Doctor Dawson said today that all plans were complete, and that the program was one of the biggest ever planned.—Napa *Journal,* December 10, 1938.

Lutgens, Rosanoff Will Discuss Mental Hospitals

Sacramento, December 14—(AP).—Harry Lutgens, State Director of Institutions, had today announced a conference for next Saturday with Aaron J. Rosanoff, Los Angeles, who will succeed him under the Olson administration.

Construction at the state mental hospitals to relieve congestion will be one of the principal subjects under discussion. A $4,000,000 appropriation has been discussed for inclusion in the next biennial budget with $4,500,000 remaining unexpended in the current budget.—San Francisco *Call-Bulletin,* December 14, 1938.

* * *

Hospitalization Group Insurance Offered Chamber

Group hospital insurance was the topic at the Chamber of Commerce meeting, held Monday at the Horseshoe Grill.

Dr. F. M. Stump led the discussion by stating that a life insurance company had offered a proposition to the Chamber of Commerce, whereby the members, as a group, could take out hospital insurance for as low as 67 cents per month for males, $1.00 for females, $1.00 for wives, and 40 cents each for children.

The plan would give free hospitalization to all members for a period of seventy days for any one period of disability.

If the plan is accepted by the Chamber of Commerce it will have the distinction of being the first to have ever been offered such a plan. A speaker will come next week to further explain the plan.—Crescent City *American,* December 9, 1938.

* * *

Health Film Shown Today

A preview of "A New Day," a film sponsored by the City Department of Public Health, was to be shown at 2 p. m. today at the Twentieth Century-Fox Film Corporation studio, 245 Hyde Street.

The moving picture, which features Gilbert Emery and a full Hollywood cast, represents the fight being waged by the Department of Public Health to reduce the number of deaths by pneumonia. The film extends over a ten-minute period. It had an initial run of a week at the Radio City Music Hall in New York City.

Plans are now under way to present it before the public here, according to Dr. J. C. Geiger, Director of Public Health.—San Francisco *Call-Bulletin,* December 13, 1938.

* * *

Olson Appoints Doctor Rosanoff

Dr. Aaron J. Rosanoff, fifty-nine, operator of a private San Gabriel sanitarium and member of the Los Angeles County Lunacy Commission since 1923, today was appointed Director of State Institutions by Governor-elect Culbert L. Olson. He will take office January 2.

He is a charter member and former president of the Southern California Academy of Criminology.—San Francisco *Call-Bulletin,* December 5, 1938.

* * *

Socialized Medicine Will Be Film Theme*

Hollywood, December 26.—Once again Hollywood is snagging a movie idea out of the newspaper headlines. Sam Goldwyn is going to town rushing his writers through a script of "I Am a Doctor," based on the current fight between the American Medical Association and the Government, over socialized medicine. In fact, Sam is sending scripters to Washington, D. C., to cover the trial of Dr. Morris Fishbein, editor of the *Journal of the American Medical Association,* and other doctors opposed to the idea of "a dollar down and a dollar a month for medical attention."

Sam is lining up an interesting cast, with Joel McCrea set for the rôle of the young doctor who believes in socialized medicine, and Walter Brennan, who almost stole "Kentucky," in another top spot. But particularly interesting is the news that Richard Bennett, father of Joan and Connie, is being sought for the rôle of the famous surgeon who is opposed to medicine on the installment plan.—San Francisco *Examiner,* December 27, 1938.

---

* By Paul F. Ewing.

Of interest because similar laws will be submitted to the 1939 California Legislature.

* By Louella O. Parsons, Motion Picture Editor, International News Service.

Graduate Conferences: Doctors Focus on Pneumonia

San Francisco, December 19—(AP). — Pneumonia was singled out today from among all the ills of mankind for the concentrated attention of California's doctors.

The selection was made by the California Medical Association Committee on Postgraduate Activities in preparing plans for a traveling medical college.

The Peripatetic School, to be started within the next three months, will be staffed by experts, who will hold classes in a dozen cities throughout California to keep practicing physicians in touch with the latest developments of medical science.

"The average total yearly deaths from pneumonia in California reaches over four thousand," said Dr. John C. Ruddock, committee chairman.—Los Angeles *Times*, December 20, 1938.

* * *

State Bar Considers Health Age Aid Plan for California Lawyers

Feasibility of an insurance plan for California lawyers which would cover funeral and burial expenses, medical service, hospitalization, retirement annuity, sick benefits and loan privileges was being considered today by the Board of Governors of the State Bar to whom it was proposed by William C. Ring, Los Angeles attorney.

Asking that the Board appoint a committee to study the matter and report to the 1939 convention of the organization, Ring said that "it is pitiful to find ninety-four lawyers who are so destitute as to be unable to pay their state bar dues." This was the number recently suspended from practice for such nonpayment.

He said he believed that full coverage insurance could be provided by a unit organized by the State Bar at comparatively inexpensive rates.

Ineligible for United States Aid

"Aside from the purely humanitarian aspect, I feel that some such plan is demanded by national economics and a reasonable security against professional delinquency," Ring stated in his communication to the Board. "Self-preservation is the first law, and the system of jurisprudence or code of ethics, which undertakes to enforce moral decency without taking the former into account, is estopped to assert its own violations."

He pointed out that the lawyer group is one of those not protected in the federal security plan, and said that under existing conditions "the complete coverage type of insurance every lawyer should have is too expensive for the average individual."

Will Provide Security

"In the past," he said, "the average lawyer has had little to look forward to in his profession in the way of old age security. Existing conditions negative the possibility of security by ordinary saving. Incomes do not permit it. But an insurance plan, contemplating monthly dues, commencing while the lawyer is young, will provide him a living anuity in forty years.

"It will also provide him with a small loan facility to defray current expenses. The records will never tell the entire story of professional delinquencies, precipitated by economic pressure, which might have been averted had there been available a source for procuring necessaries."—Los Angeles *Evening Herald and Express*, December 23, 1938.

LETTERS

Subject: The Motion Picture, "A Man to Remember."

Los Angeles County Medical Association
Los Angeles, California,
December 6, 1938.

To the Editor:—On Monday, December 5, a representative group of members of the Council of the Los Angeles County Medical Association and officers attended a preview of the motion picture, "A Man to Remember," produced by the R. K. O. Studio. The picture will be released this week.

The Council at its meeting last night, upon motion duly made and seconded, recommended this picture to the membership and instructed the editor to prepare an editorial relative to it for the Bulletin.

It is the opinion of the men who witnessed this picture that it is one of the best portrayals of the old family doctor ever to come out of a motion picture studio.

Attached is a copy of the editorial to appear in the current issue of the Bulletin.

It is suggested that other county societies be advised of the merits of this production, and asked to watch for its release in their respective communities.

Cordially yours,
George D. Maner, M.D.,
Secretary.

* * *

"A Man to Remember"

Motion Picture Eulogizing the Family Physician Is Recommended by the Council—Members Are Urged to See it.

"A man to Remember" is a motion picture to see; if seen it will be remembered, not only by the members of the profession it eulogizes, but by the millions of theatergoers, who, during the coming months, will be profoundly affected by it.

Motion pictures come and go. In recent years a number of them have been brought to the special attention of medical men. Some of these productions have been based upon medical themes; have been fairly accurate historical presentations depicting the advance of scientific research and the resultant benefits to humanity. They unquestionably have played an important part in educating the public to the value of scientific medicine.

Never, however, had the Council of the Los Angeles County Medical Association, gone on record as formally recommending any motion picture to the members until its meeting on Monday evening, December 5, when it adopted a motion recommending the current release, "A Man to Remember," produced by R. K. O. Studios, and now being shown at Pantages, Hollywood, and R. K. O. Hill Street theaters.

Every doctor is urged to view this picture; to consider its value, to recommend it to his friends and his patients as he undoubtedly will so see fit.

In the past there have appeared pictures in which the man of medicine plays a part; pictures that have exaggerated isolated instances to cast aspersion upon the entire profession in attempts to create drama at any cost.

"A Man to Remember," the story of a family physician in a small city—is in reality the story of a countless number of family physicians who devote their lives to the healing of the sick, who are living examples of what the Oath of Hippocrates means; men who work for humanity only, regardless of themselves. A picture such as this, with its honesty of purpose and its wholesome drama, is indeed welcome.

Members of the Council attended a special preview of this picture and went away greatly impressed by it, not only because it is a story of one of their own profession, but because it is a story that is great in itself and which should have tremendous dramatic appeal for all laymen as well as physicians.

Especially to be commended is the artistry of Edward Ellis in the rôle of John Abbott, M.D., "A Man to Remember."

Subject: Thanks from the American Red Cross.

The American Red Cross
National Headquarters
Washington, D. C.
December 5, 1938.

To the Editor:—Please allow me to express to you in behalf of our national officers our very sincere appreciation for the generous contribution of space which you gave to the American Red Cross in the California and Western Medicine. It is through the splendid coöperation which you and others give to us each November that we are enabled to extend a universal invitation to all Americans everywhere to participate in Red Cross work through individual memberships.

Cordially yours,
Douglas Griesemer,
Director of Public Relations.

Subject: Third Congress of the Pan-Pacific Surgical Association.

To the Surgeons of the Countries of the Pacific!

My dear Colleagues:

The Third Congress of the Pan-Pacific Surgical Association to be held in Honolulu, September 15 to 28, 1939, is an occasion of more than average significance for every surgeon practicing in the nations bordering on the Pacific.

The Association was organized in 1929 by surgeons from China, Australia, New Zealand, Japan, Canada and the United States, meeting together in Honolulu. At this meeting those in attendance became keenly aware of the great value of bringing together at regular intervals men from the ends of the vast Pacific area, and it was voted to hold similar assemblies in Honolulu at three- or five-year intervals.

The aims of the association as embodied in the Constitution adopted at that time are simply:

1. To bring to Honolulu surgeons from countries bordering on the Pacific Ocean, so as to permit the exchange of surgical ideas and methods.
2. To further the principles of hospital standardization.
3. To develop an acquaintanceship among the surgeons so that they may be instrumental in developing a spirit of good fellowship among the races bordering on the Pacific.

There is no great burden of organization. Membership is by attendance, and the dues are the registration fee of $25 for the Congress attended.

A postgraduate session, to follow the Congress for ten days, is planned. Details as to courses and instructors are not yet available but will be made known to the chairman of your country as soon as definitely arranged.

The medical men of Hawaii are arranging many pleasurable activities for the afternoons and evenings that the Congress is not in session. The week-ends will be available for tours to the other islands of the Hawaiian group. No place in the world offers so much in the way of diversion, relaxation, and rare scenic charm as Hawaii, so picturesquely called the "Paradise of the Pacific."

"Pahi," 64 Symonds Street,
Auckland, New Zealand.

Cordially yours,
J. Hardie Neil, *President.*

Subject: Lure of Medical History article on bubonic plague in California by George H. Evans.*

(copy)

Treasury Department
Public Health Service
National Institute of Health
Washington, D. C.
December 21, 1938

George H. Kress, M.D.
Editor, California and Western Medicine,
San Francisco, Cal.

Dear Doctor Kress:

Referring to your letter of December 2, I have just received the copy of the journal referred to therein, and have read Doctor Evans' article with much interest. I had delayed writing until receiving this copy, thinking that some further comment might be called for in view of my own brief paragraphs on plague in San Francisco in Supplement 141, but none seems necessary. I shall look up the other chapters of Doctor Evans' contribution.

I have requested the publications section at the Bureau to forward to you a copy of Supplement 141 and trust that you will receive it promptly. Only a small edition was printed, since it was intended more for a record than for general distribution, and I have no remaining copies for personal disposition.

Sincerely yours,
A. M. Stimson,
Medical Director, United States Public Health Service.

Subject: Letter from possible beneficiary member of the California Medical Association Medical Service.

(copy)

San Jose, California,
December 6, 1938.

California Medical Association.

Gentlemen:

In the November 26, 1938, issue of the *Pacific Rural Press*, appears an article saying "Medical Insurance Arrives," and goes on to say, "Citizens may pay a flat rate per month and go to a physician of their choice."

I'm writing to ask if this service is now in operation, and how does one join, and where? Both my husband and I need medical care, but, on part-time pay, cannot afford the very costly services of a good doctor, and we will not run up a large bill that we cannot pay.

I will be glad to pay a regular fee per month, if real medical service is available. If this is not now in effect, how soon do you expect it to be?

In my own opinion (and experience) medical insurance will be a great boon to the small-salaried group, and please hasten it along.

Thanking you in advance for your reply, I am

Sincerely,
(Signed): ————————

SPECIAL ARTICLES

FEDERAL GRAND JURY OF DISTRICT OF COLUMBIA AND THE AMERICAN MEDICAL ASSOCIATION*

AMERICAN MEDICAL ASSOCIATION AND TWENTY-ONE DOCTORS INDICTED AS TRUST

Monopoly in Medicine Charged—Federal Action Follows Fight on Coöperative Health Plan

Washington, Dec. 20 (INS).—The powerful American Medical Association, three professional societies, and twenty-one nationally known leaders in medicine and surgery were indicted by a federal grand jury today on charges of violating the antitrust laws.

Specifically, this blue-ribbon aggregation was accused of the alleged restraint of a group health movement undertaken by hundreds of low-income workers.

The indictments were returned after two months' investigation by the grand jury with the assistance of the Department of Justice and its investigators, and culminated the first phase of a history-making official action against organized medicine.

DR. FISHBEIN INDICTED

Chief among those indicted were:

Dr. Morris Fishbein, known as the "voice of American medicine" in his capacity as editor of the *Journal of the American Medical Association.*

---

* See following issues: November, page 383; December, page 458; this issue, page 24.

If present plans do not miscarry, Medical Director Stimson's article will appear in the February issue.

* Because of the importance of the issues involved, generous space is given for a presentation of press articles concerning the District of Columbia controversy, regarding which articles have appeared in previous issues.

Olin West, secretary and general manager of the Association.

William C. Woodward, director of the American Medical Association Bureau of Legal Medicine and Legislation.

William D. Cutter, secretary of the Council on Medical Education and Hospitals of the American Medical Association.

Rosco G. Leland, director of the Bureau of Medical Economics of the organization.

SOCIETIES ACCUSED

The three professional societies named with the Medical Association were the Medical Society of the District of Columbia, the Harris County Medical Society of Houston, Texas, and the Washington Society of Surgery.

It was the first time in history that the Federal Government had resorted to the antitrust laws in proceedings against the medical profession, and if the defendants are found guilty they are subject to a maximum fine of $5,000 or a year's imprisonment, or both.

The grand jury charged that the defendants conspired to thwart the operations of Group Health Association Inc. of Washington, D. C., a nonprofit coöperative association, formed in Washington about a year ago and claiming about 2,500 members.

OBSTRUCTION CHARGED

The organization seeks to provide medical care and hospitalization to its members on a risk-sharing prepayment basis.

The defendants, according to the indictments, combined and conspired to hinder and obstruct the group health organization's efforts in obtaining qualified doctors for its medical staff.

All doctors who were willing to assist the Group Health Association were threatened with disciplinary action, it was alleged. In one case the defendants expelled one of their colleagues from the medical society of the District of Columbia for participating in the group health plan, the jury charged further.

The Harris County (Texas) Medical Society was drawn into the case on charges it took "disciplinary action" against a doctor who had joined the health group. The doctor belonged to the Texas society and the discipline was undertaken at the alleged instance of the Washington society.

The Texas society later dropped all charges against the doctor.

BARRED AT HOSPITALS

The jury also found that the defendants sought to prevent the Group Health Association from obtaining access to hospitals in Washington and to prevent medical treatment for operations in these hospitals on the part of the organization's doctors.

The grand jury noted that because of the unprecedented advance in medical knowledge and technique that has taken place during the last few decades costly diagnostic and therapeutic equipment and facilities are now available.

Many persons within the low-income groups throughout the country cannot afford, as individuals, to obtain complete and adequate medical care, the jury held. It added that group medicine, "if not obstructed by coercive restraints," may contribute to the solution of providing complete and adequate medical care to persons with small incomes.

ONE HUNDRED AND TEN THOUSAND AMERICAN MEDICAL ASSOCIATION MEMBERS

Of the 145,000 doctors engaged in practice in the United States, approximately 110,000 are members of the American Medical Association. The jury emphasized that, because of the American Medical Association's great influence in the field of medicine, any plan that meets with the organization's disfavor can be easily thwarted.

The indictment set forth that the *Journal of the American Medical Association,* which has a weekly circulation of 95,000, has been edited in a manner to express opposition to group practice on a risk-sharing prepayment basis.

In addition the jury found that the American Medical Association's Bureau of Medical Economics has taken a leading part in opposing, discouraging, and suppressing group medical practice.

OTHERS INDICTED

Included in the indictments were Dr. Arthur Carlisle Christie, Coursen Baxter Conklin, James Bayard Gregg Custis, Thomas Allen Groover, Robert Arthur Howe, Leon Alphonse Martel, Thomas Ernest Mattingly, Francis Xavier McGovern, Thomas Edwin Neill, Edward Hiram Reede, all of Washington.

Also Drs. William Mercer Sprigg, William Joseph Stanton, John Ogle Warfield, Jr., Prentiss Willson, Wallace Mason Yater and Joseph Rogers Young, also of Washington.

* * *

FISHBEIN HURLS DEFENSE CHALLENGE

Chicago, Dec. 20 (AP).—Dr. Morris Fishbein, spokesman for the American Medical Association, when informed of the federal indictments returned in Washington today for violation of the Sherman Antitrust Act, said:

"The House of Delegates has authorized the Board of Directors of the American Medical Association to defend the case to the limit."—San Francisco *Call-Bulletin,* December 20.

* * *

TWENTY-ONE HIGH MEDICAL FIGURES INDICTED IN UNITED STATES TRUST PROBE

Fishbein, Indignant, Maps Bitter Legal Fight

Washington, Dec. 20—(INS).—A Federal Grand Jury today took history-making action against the medical profession by indicting the powerful American Medical Association, three professional societies, and twenty-one outstanding physicians and surgeons on charges of violating the antitrust laws.

The indictments accused them of consipring to restrain a group health program for workers in the low-income bracket.

LEGAL BATTLE

The action culminates two months of investigation by the grand jury with the aid of crack Justice Department attorneys and raised the curtain for a bitter, last-ditch fight between the Federal Government and the medical profession. Of the 145,000 doctors in this country, 110,000 are members of the American Medical Association.

Announcement of the jury's action provoked a determined declaration in Chicago by Dr. Morris Fishbein, official spokesman of the American Medical Association, that his organization will fight the indictments with all its resources. Doctor Fishbein, who is editor of the journal of the Association and is one of those indicted, declared:

"My only comment is this: The House of Delegates of the American Medical Association has authorized the Board of Trustees to use, if necessary, the last resources of the Association in defending this case. Our attorneys have advised us to say only that much."

Besides Doctor Fishbein, others indicted included:

Olin West, secretary and general manager of the Association; William Creighton Woodward, director of the American Medical Association Bureau of Legal Medicine and Legislation; William Dick Cutter, secretary of the Council on Medical Education and Hospitals of the American Medical Association; Rosco Genung Leland, director of the Bureau of Medical Economics of the American Medical Association.

MANY INDICTED

The three professional societies indicted with the American Medical Association are the Medical Society of the District of Columbia, the Harris County Medical Society of Houston, Texas, and the Washington Society of Surgery.

Other individuals indicted are: Drs. Arthur Carlisle Christie, William Mercer Sprigg, William Joseph Stanton, John Ogle Warfield, Jr., Prentiss Willson, Wallace Mason Yater and Joseph Rogers Young, Coursen Baxter Conklin, James Bayard Gregg Custis, Thomas Ernest Mattingly, Francis Xavier McGovern, Thomas Edwin Neill, Edward Hiram Reede, all of Washington, D. C.

Announcement of the indictments rocked the medical world. Never before has the Federal Government proceeded against the medical profession by invoking the antitrust laws. The defendants face a maximum fine of $5,000 or a year's imprisonment or both, if found guilty.

SPECIFIC CHARGES

Specifically, the Grand Jury charged:

1. The defendants conspired to restrain the functioning of the Group Health Association, Inc., of Washington, D. C., a nonprofit coöperative association of Government employees, claiming 2,500 members.

2. They conspired to frustrate efforts of the Washington group to obtain qualified doctors for its staff, threatening disciplinary action and in one case actually expelling from the Washington Medical Society a physician who participated in the group health program.

SOUGHT TO HALT AID

3. They sought to prevent the Group Health Association from using Washington hospitals and to prevent medical treatment or operations in the hospitals undertaken by doctors affiliated with the movement.

4. The American Medical Association's journal, which has a weekly circulation of 95,000, opposed group medical practice on a risk-sharing prepayment basis.

5. The American Medical Association's Bureau of Medical Economics played an active rôle in opposing, discouraging and suppressing such group medical programs.

6. The staffs of hospitals in Washington are rigidly regulated by the Medical Society of the District of Columbia, an American Medical Association affiliate.

7. Washington hospitals did not give access of regular facilities to the group health organization because they feared loss of prestige if the American Medical Association resorted to reprisals.

The Grand Jury took cognizance of the great strides taken by the medical world in the field of research and technique and that costly diagnostic and therapeutic equipment and facilities are available. But, it added, many in low-income brackets cannot pay for this, as individuals. The Jury insisted that group medicine, "if not obstructed by coercive restraints," could very well help solve the problem of providing adequate care for those of small incomes.—San Francisco *Examiner,* December 21.

* * *

UNITED STATES INDICTS MEDICAL ASSOCIATION AND TWENTY-ONE DOCTORS AS TRUST LAW VIOLATORS

Action Result of Battle Over Health Service

Washington, Dec. 20 (AP).—A legal fight fraught with major import for the future history of medical care in the United States began today when a Federal Grand Jury indicted the American Medical Association, three affiliated societies, and twenty-one leading physicians on a charge of violating the Sherman Antitrust Act.

The Medical Association announced immediately that it would throw all its energies into the battle against the charge. Dr. Morris Fishbein, leader in the Association, said at Chicago that its House of Delegates had authorized its Board of Directors to "defend the case to the limit."

The indictment grows out of a fight by organized medicine against Group Health Association, Inc., a coöperative set-up in Washington to provide medical care for Government workers who pay periodical, risk-sharing fees in advance.

RESTRAINT CHARGED

The charge is that the defendants conspired to restrain trade by preventing physicians hired by the coöperative from practicing in Washington hospitals or consulting with other doctors. It is also alleged that one doctor was ousted from the District of Columbia Medical Society because of his work with the coöperative, and that proceedings were started against another for the same reason.

Thurman Arnold, new assistant Attorney General who contends the antitrust laws have not been rigorously enforced in the past, instituted the action against the Medical Association and the others named defendants today.

The indictments, copies of which were released by the Department of Justice when the Grand Jury returned its report, names, besides the Medical Association, the District of Columbia Medical Society, the Washington Academy of Surgery, and the Harris County (Texas) Medical Society.

DOCTORS INDICTED

Also named defendants were Doctor Fishbein, who is editor of the American Medical Association journal; Dr. Olin West, secretary and general manager of the Association; Dr. William C. Woodward, director of the Association's Bureau of Legal Medicine and Legislation; Dr. William D. Cutter, secretary of the Council on Medical Education and Hospitals of the Association, and Dr. Rosco Genung Leland, director of its Bureau of Medical Economics.

Sixteen Washington physicians were also named in the indictment.

Indications are that the Association may carry the case to the United States Supreme Court, if necessary, with the contention that its operations cannot be restricted by the Sherman Act since medicine is not a trade but a profession. Attorneys for the Association have emphasized that point repeatedly.

BACKGROUND OF CASE

Behind the case is a strenuous controversy over methods of providing medical care. At the National Health Conference here last July, President Roosevelt's Committee on Health and Welfare declared that about one-third of the population—those in families with incomes of less than $1,500 per year—receive practically no medical care and are unable to meet the expense of sudden illness.

It recommended the establishment of prepaid medical insurance programs for such groups. These would be patterned after the Group Health Association in Washington.

The American Medical Association was critical of such organizations, contending that supervision of medical care would be placed in the hands of officers of the organizations instead of being directed by physicians, and that patients would not receive proper care as a result.

It is now proposing, through its member societies, the establishment of prepayment medical care associations which will be organized and supervised by the local medical groups.—San Francisco *Chronicle,* December 22.

* * *

AMERICAN MEDICAL ASSOCIATION INDICTED BY GRAND JURY

Federal Body at Washington, D. C., Returns True Bill Against Group Charging Trust Law Violations

Washington, Dec. 20 (UP).—A Federal Grand Jury today returned indictments against the American Medical Association, three other medical societies, and twenty-one individuals, charging violations of the antitrust laws. The indictments were based on charges that the American Medical Association and affiliated medical organizations used unfair tactics in opposing the coöperative Group Health Association, members of which include many Government employees.

Outcome of the case is expected to determine the fate of coöperative medicine in the United States—and ultimately may have far-reaching effects on every individual practicing medicine or receiving medical care.

FISHBEIN INDICTED

The indicted individuals included Dr. Morris Fishbein of Chicago, editor of the American Medical Association's journal, and prominent spokesman for the medical profession.

In addition to the American Medical Association, indictments were returned against the Medical Society of the District of Columbia, an affiliate of the American Medical Association; the Harris County Medical Society of Texas, and the Washington Academy of Surgery.

Assistant Attorney General Thurman Arnold announced the Government's intention to seek indictments against the American Medical Association and the Medical Society last August, five months after he left his professorship of law at Yale.

THREE PRACTICES ASSAILED

He named three specific practices which, he said, violate federal antitrust laws:

Threatened expulsion from the Medical Society and virtual professional ostracism for doctors who joined the Group Health Association staff;

Threatened expulsion for doctors who consulted professionally with Group Health Association staff members, and

Exerting influence on Washington hospitals to refuse Group Health Association doctors use of their facilities.

These tactics, Mr. Arnold said, operate to deprive individual members of Group Health Association of the services of the doctor they select—when they enter a hospital their Group Health Association physician is not allowed to care for them.

Seth Richardson, attorney for the American Medical Association, said he had expected the indictments.

He added that "the defendants and ourselves believe the Government is proceeding on a glaringly illegal basis."—San Francisco *News*, December 20.

INDICTED MEDICAL CHIEFS MAP FIGHT

Association and Twenty-One Doctors Deny Guilt

Chicago, Dec. 20—(INS).—Legal experts of the American Medical Association, which was indicted with twenty-one nationally known medical leaders and three other societies, were preparing tonight for a finish fight against charges of antitrust law violation.

All officials of the Association will plead not guilty, their Chicago attorney, Edward M. Burke, announced.

Dr. Morris Fishbein, editor of the journal of the Association, spokesman for the medical organization, and one of the twenty-one indicted, declared:

FIGHT PROMISED

"The House of Delegates of the American Medical Association has authorized the Board of Trustees to use, if necessary, the last legal recourse and the last resources of the Association in defending the case."

Doctor Fishbein also quoted from a statement by the House of Delegates after it had received a report from a special committee to which recently was referred the threat of the Department of Justice to seek indictments against the American Medical Association and its leading members.

The statement, issued last September, said:

"Your Reference Committee highly commends the Board of Trustees for its willingness to submit to investigation by any authorized agency on the nature of its organization work, conduct, and activity.

INDICTMENT FORESEEN

"Firm in a belief in the probity of our officers, and confident of their adherence to established federal law, your Reference Committee recommends that, in the event of an indictment, this House of Delegates gives full support to the Board of Trustees in defending such litigation to the utmost, with every means in its power, exhausting, if necessary, the last resource of distinguished legal talent, to establish the right of organized medicine to use its disciplines to oppose types of contract practice damaging to the health of the public."

NOT EXCITED

Dr. Olin West, secretary and general manager of the Association and another of the prominent medical men named in the indictment, took the news of the Federal Grand Jury's action more casually, saying:

"This is not altogether unexpected, of course. We are not going to get excited about it.

"For the life of me, I can't see how the anti-trust laws apply to the medical profession. It seems to resolve itself into a question of whether medicine is a profession or a trade.

"If it is a profession—which seems reasonable—I do not believe it can come under the antitrust laws.

"We have had no direct communication with the Department of Justice on this matter. We did receive several subpoenas for records which we gladly turned over to them. All of our files are open to the Department whenever they wish to use them."—San Francisco *Examiner*, December 21.

MEDIC ASSAILS INDICTMENTS

Portland, Oregon, Dec. 22 (AP).—Dr. R. G. Leland, director of the Bureau of Medical Economics of the American Medical Association, called the sixteen federal indictments returned on Tuesday against members of the District of Columbia Medical Society and five American Medical Association officials the "most diabolical persecutions of the medical profession we have ever witnessed."

He spoke before the Multnomah County Medical Society.—San Francisco *Call-Bulletin*, December 22.

* * *

INDICTING THE AMERICAN MEDICAL ASSOCIATION

The indictment of the American Medical Association, three local medical societies, and twenty-one individual physicians under the Sherman Act is probably the silliest piece of business the opinionated and bureaucratic New Deal has yet indulged in. Unless the courts completely lose sight of the patent facts, they will be compelled to rule that physicians and medical associations are engaged neither in trade nor commerce and hence do not come under the Antitrust Act; and the dismissal of the indictment will be haled by Dr. Morris Fishbein as a triumphant vindication.

It may be granted that both Doctor Fishbein and some others of the ruling spirits of the American Medical Association have gone to unreasonable lengths in opposing group health organizations. But this situation is in process of working itself out, as the recently announced plan of the California Medical Association indicates; the problem could undoubtedly be solved by concessions on both sides, which would safeguard both physicians and the public.

To subject this body of physicians, which as a whole acts with the best of intentions according to its lights, to criminal prosecution is to misuse the powers of governmental authority and probably to defeat its own object. The opposition of the American Medical Association to particular forms of group medical supervision may be and probably is mistaken in some particulars, but it is sincere, and as far as possible from indicating criminal intent.—Editorial, Los Angeles *Times*, December 21.

* * *

CASE OF DOCTORS: SOCIALIZED MEDICINE

But—Says Boake Carter

The mass production mania has now engulfed the medical profession.

The Government has succeeded in obtaining indictments against the American Medical Association and twenty-one of the nation's leading physicians and surgeons as conspirators to violate the antitrust laws and prevent "trade."

The "trade" is group medical practice performed on a coöperative basis. The scene of the battle is the District of Columbia.

The group medicine disciples charge the American Medical Association with bringing pressure to bear on hospitals and the 120,000 out of the 140,000 doctors in the United States who are members to prevent the operation of group medicine.

The medical profession retorts that the Sherman Antitrust Law cites restraint of "trade"; that the practice of medicine is not a "trade" but a "learned profession"; that anything which prevents the right of a patient to free choice of his own doctor is dangerous to the public health.

* * *

There are many points to be remembered before taking up cudgels for either side. First, the Government is pushing the case and the Administration has a mass-production public health scheme it desires to foist upon the public. The indictments, therefore, serve as excellent government propaganda, even should the Government lose the case in a court of law.

Further, if organized medicine is not permitted to lay down some code of ethics and rules, by which doctors must be guided in their conduct, and by which they may be disciplined for infraction, why does the same administration encourage the formation of labor unions, which establish rules by which workmen are disciplined when they break the rules?

There are various kinds of organizations which give group medical care in the United States. Their number totals well over two thousand. Upon hundreds the American Medical Association has stamped its approval because they did not violate the fundamental right of a patient to pick his own doctor. But there are others which do not permit such free choice and which, furthermore, require a third party to hire and sublet the physicians' services. In obtaining the indictments the Government has made no effort to make this vital differentiation clear to the public.

* * *

It is conceded that the American Medical Association is not perfect. This writer long ago contended that its control was too conservative for these modern days; warned that rigidity of control would some day flare back in its face. It must also be acknowledged that the American Medical Association has eased its codes considerably in the past five years. But in any case it is the guardian body which sustains the high standards of healing used in the United States, and it is pitiable to see the power of the United States Government being used to undermine the confidence of laymen in the integrity and decency of their doctors.

To be sure there are crooked doctors. But are there not also crooked lawyers? If the Government desires to bedevil the American Medical Association as an organization restraining "trade," then let the Government also bedevil the American Bar Association for similar reasons.

This, of course, it would never do. There are too many lawyers working for the Government!—San Francisco *Examiner*, December 27, 1938.

MEDICINE'S GIFT TO MANKIND

From its very beginnings the science of medicine has contributed vastly to the happiness of human beings, an editorial in the December issue of *Hygeia* says. Even man of prehistoric days trephined the skull to relieve pains coming from pressure within. Yet these simple efforts were only the beginning of a process which was eventually to free mankind from the greatest tyrant that he has ever known, the tyrant of fear; and of all fears which disturb mankind the greatest is the fear of pain, suffering, disease and death. In an earlier period in the history of man, hundreds of thousands of human beings were destroyed by disease and by great plagues which used to sweep across the world. Today the people who live in civilized communities no longer fear smallpox, typhoid, yellow fever, bubonic and pneumonic plague, trypanosomiasis, cholera, leprosy or even syphilis. One by one the causes of the infectious diseases have been discovered, the means of transmission have become known, and these diseases have been eliminated or at least brought under control.

Before the time of Pasteur, surgery was limited to just a few simple operative procedures, including amputation of limbs. There were but few physicians competent to invade the interior of the human body. Then came our understanding of the germ causation of disease, and the demonstration by the famous Lister of the possibility of eliminating infection. Before our knowledge of the germ causation of disease and before the introduction of antiseptics and of aseptic methods, surgery was viewed with horror by every person confronted with the necessity for an operation. Forty-five per cent of amputations resulted fatally. Hospitals smelled to high heaven with the pus, the decay and the inflammations of infected wounds. Today there is no portion of the human body which the surgeon does not invade; lives are greatly prolonged; the operating room is a clean, white refuge for those who require its service.

Life expectancy of man at birth in the United States has moved up from an earlier thirty-five years to almost sixty-one years, and it is conceivable, with suitable application of what medicine now knows in relation to hygiene and in relation to the control of the degenerative diseases, that life expectancy may be advanced an additional five years. The physician has coöperated with health departments, with authorities in schools and with newspapers, radio networks, and other means of public information to spread widely the knowledge of the nature of disease and of the methods of prevention. Thus the physician is perhaps the only worker in all the world who spends most of his time destroying the conditions by which he has gained his livelihood. Vast numbers of people now share the knowledge of medicine, which is no longer held a mystery. The frontiers of medicine are constantly changing. Medicine is a living, vital science, constantly moving to attack new problems that arise. It has given vastly of itself to mankind in the past, and it stands ready to give more, if it can, in the future. It makes to mankind no promise of immortality or even of eternal youth; but it does offer to those who are ready to receive its gifts, increasing years of usefulness.—*American Medical Association News.*

HOW NEW FEDERAL ANTITRUST "CODES" ARE DRAFTED

How Are the New "Codes" for Industry Drafted? What Is the Source of the Regulations? The Answer Is Given Here

The new technique of the Department of Justice for enforcement of the antitrust laws continues to raise questions important to business.

If a group of industrial or union or professional leaders is indicted on charges of violating those laws, for example, exactly what can it expect as the next step?

Thurman Arnold, Assistant Attorney General, who heads the Antitrust Division, explains that in certain instances the Government will ask dismissal of the criminal indictments if the defendants agree to reforms of benefit to the public.

But there has been a missing link in the public explanations made of the procedure to date. That link itself is a question:

How can the defendants in a particular case learn just what reforms the Government would accept as justifying dismissal of the indictments?

SOURCES OF REGULATIONS IN THE NEW "CODES"

First impressions, from the statements of Mr. Arnold and other officials, were that the Department of Justice would make no suggestions for inclusion in "consent decrees," as the new codes of fair practice are known. Inquiry develops that this is not exactly the case, however.

What happens is this:

Counsel or friends of the defendants approach the Department of Justice with suggestions that they would like to negotiate for a code. They are told that one can be submitted by them, that the Government lawyers will look it over, and reply.

In the course of informal conferences, according to Department of Justice men who have participated in the procedure, ideas inevitably are exchanged. If the proposed code is considered unsatisfactory, then the Government may or may not suggest the inclusion of other reforms.

This is said to be what occurred during the weeks of discussion which preceded the agreement between the Department of Justice and the Ford and Chrysler automobile companies that led to a dropping of antitrust charges against those companies. It is still not clear whether the Government or the companies' participants suggested inclusion of promises to change certain financing and advertising practices.

CHICAGO MILK INDUSTRY MAY ACCEPT DECREE

Now to look ahead.

Certain milk producers, distributors and public officials in Chicago have been indicted. The case may never go to trial, because a consent decree or code may be accepted as the best way out.

The Department of Justice, it is learned, has asked the Department of Agriculture for suggestions about what conditions of benefit to the public might well be written into such a code. If counsel for the defendants begin negotiating for a code, then the Government lawyers and economists will have the chance to suggest reforms which go beyond the law but which the Department of Agriculture would like to effect.—*United States News,* December 5.

VOLUNTARY AND COMPULSORY HEALTH INSURANCE

Medical indemnity insurance for voluntary prepayment of doctors' bills, as an alternative to state-controlled compulsory health insurance, was advocated recently by Dr. Peter Irving, Secretary of the New York State Medical Society, talking before the Rotary Club of New York.

Doctor Irving explained that many types of socialized medicine are successful and receive the support of the medical profession, such as the control of communicable diseases and of tuberculosis and pneumonia, as well as the maintenance of state and municipal hospitals.

"But should the State," said Doctor Irving, "try to extend its medical activities further through compulsory health insurance so as to accompany the doctor across the threshold of the sick room and place the hand of government upon the patient's pulse, then the doctor must clearly register his remonstrance.

"Compulsory health insurance is supported by contributions from the employees' pay envelope, the employers' payroll, with an added contribution from the state. The doctor looks with alarm at the possibility that the administration of the service will be controlled by a political bureaucracy. Yet he is interested in any measures that can be taken which would help more people to get good medical care. Hospital insurance of the voluntary kind with government entirely out of the situation has proved itself successful to cover part of the risk of illness. This does not include the doctor's bill. The latest suggestion to fill this gap is voluntary nonprofit insurance. Such plans are now in a formative state. The law at present does not permit such associations to organize, but the New York State Medical Society will seek to obtain amendments to the laws so that they can operate."

Doctor Irving explained that this type of insurance would permit participation by all groups of the public, whereas compulsory health insurance applies only to the worker, and does not cover his family in European countries where it has been tried. The vast group of farmers and professional people are also not within its scope, he said.

"Red tape mechanism under compulsory health insurance," said Doctor Irving, "takes up the time of the doctor which he needs for study or rest; there intrudes into the practice of his profession an office force supervising his methods of diagnosis and treatment and dictating the remedies he uses. His waiting room is overcrowded; he has less time than is necessary to properly carry out the work of diagnosis and treatment.

"With tax funds an ingredient in the system, and a further sickness tax levied on employer and employee, political control is inevitable. This seems a real danger because the Government, in making contributions to the necessary funds, would surely feel it a duty to supervise administration. While it is not my place, perhaps, as a practitioner to go into the economic side of this type of socialization in medicine, there are some things that I think it is fair for me to point out for consideration of business men. One of these is the fact that this is pure socialized medicine though employer and employee make contributions. These contributions are made under the compulsion of law whether the employer or employee wishes to participate or not, and become therefore taxes. Largely these taxes come from business and would have to be figured in financing.

"Another thing to think of is the possibility that business, if medicine should be completely socialized—and compulsory health insurance would certainly be a step that way—would have issued an invitation for socialization of other pursuits including business. How much that is a danger in the United States is for the people of this country to decide.

"The doctor judges all these matters of socialization from a single standpoint of whether or not they will work out in practice to provide patients with the best medical care it is within his power to give."—*Medical News,* Medical Society of the State of New York.

HIGH INFANT MORTALITY*

Laid to Economic Irregularities; Declared Preventable

As one of the government's departments represented on the President's Interdepartmental Committee to Coördinate Health and Welfare Activities, and as the agency responsible for fostering, promoting and developing American wage earners' welfare, the Department of Labor is keenly interested in the health needs of mothers and children.

The generation in which most of us came to maturity was shocked by gross inequalities found between slum areas and favored sections of our great industrial cities. This early concern with city poverty is still justified.

---

* By Katherine F. Lenroot, Chief of the Children's Bureau, Department of Labor, Washington, D. C.

Only within the last five years has overwhelming evidence been accumulated regarding inequalities in standards of living among the great geographical regions into which our country is divided, and among major occupational groups, such as farmers and nonfarmers.

It is the poorest areas with lowest levels of living that have the largest ratio of child to adult population and that constitute the reservoir for population replacement for the rest of the country.

INFANT MORTALITY HIGH IN RURAL AREAS

Since 1929 infant mortality rates have been higher in rural areas than in cities. The National Resources Committee reports rural people die in relatively greater numbers from diseases of childhood—measles, scarlet fever, whooping cough, diphtheria—and from certain diseases of adolescence and young adult life such as tuberculosis. These are diseases toward control of which medical science has made greatest progress.

Reports from state health departments received within recent months by our Children's Bureau translate into terms of motherhood and childhood these general statements and averages.

In a northwestern state it was reported that two-thirds of the total population did not have funds for medical and dental care, that few physicians were left in rural areas and that some counties had no physicians.

The outstanding need was said to be medical care for mothers and babies.

In the Middle Atlantic States the county health officers estimate that one-third of the states' public health nursing effort is fruitless because of lack of adequate shelter, coal, food, blankets and clothing.

In a southern state it is reported two counties are without physicians because of the people's economic condition, widely scattered population and distance of other communities from any medical service. One-third of all babies born in this state are delivered by midwives.

In a mountain state it is reported that in one county there is no physician and that all the babies born during the coming year will be delivered by midwives. Many people in that state live more than 100 miles from a hospital.

TWO WAYS INEQUALITIES CAN BE REDUCED

There are two ways in which inequalities among regions and occupational groups can be reduced and standards of living improved:

1. By increasing economic opportunity through introduction of new industries or agricultural undertakings; expansion of more efficient organization of old industries or agricultural activities or migration to areas of more favorable economic opportunity.

2. By introduction or expansion of tax-supported services to supplement the economic resources of families; to provide families with a minimum of security against death, accident, illness or other major catastrophes; and to supply those elements in the standard of living which depend on community effort with tax support rather than on individual purchase.

TOTAL YEARLY LOSS OF 160,000 LIVES

It is essential that both these lines of endeavor be carried on simultaneously. It is also essential that there be clear understanding of the place of continuing tax-supported services for health, education, social security and social welfare, as a normal contribution to a higher standard of living.

A total yearly loss of approximately 160,000 maternal and infant lives, at least half of which is preventable, places upon us a grave obligation to find a solution.—San Francisco *Examiner*, December 11, 1938.

PROCRASTINATION, THE THIEF OF LIFE IN CANCER*

The subject of my talk is "Proscrastination, the Thief of Life in Cancer." It is evident that this title is a simile of the old proverb, "Procrastination is the Thief of Time." The latter is a saying which, liberally interpreted, means, "Do not put off until tomorrow what you can do today."

Let us first consider how this proverb may apply to cancer. The disease—cancer—is always fatal unless treated. On the other hand, if it is recognized in the early stages and is properly treated, it is curable. Therefore, if we recognize this condition in the beginning, when it is curable, and we neglect or delay going to our doctor at once, we procrastinate and in this respect procrastination is the thief of life when dealing with cancer.

During the past ten years great effort has been put forth to educate the public in regard to cancer, and it may be said that much has been accomplished, for most people have some knowledge about this disease. However, the desired results have not been obtained. Many people who recognize suspicious symptoms neglect to take advantage of this knowledge and have delayed in consulting their doctor, fearing they might be told they have cancer. This fear is now one of the stumbling-blocks of our success in the cure of cancer. We have several reliable methods for the cure of early cancer, but none for advanced cancer. Cancer is a progressive disease and always fatal if not treated. The early symptoms are not specific, and similar signs may be caused by other conditions. Therefore, an individual who may fear cancer because of certain signs will be greatly relieved to find upon examination by his doctor that there is no cancer; but if cancer is present, the one chance for recovery lies in its early recognition and treatment.

Cancer never begins as cancer but almost always as some inflammatory or abnormal condition which exists for a considerable period of time before the malignant change takes place. These inflammatory conditions which may change into cancer are sometimes called precancerous conditions and in nearly all cases give symptoms which may be observed by the individual, and if we consult our physician at once these inflammatory conditions are corrected and we prevent cancer. If the change has already taken place, it is probable that we have discovered the cancer at its inception. I wish to emphasize the fact that cancer is a localized disease in the beginning, and at this time it is curable, for we can remove the cancer cells by a surgical operation or we can destroy them by x-ray or radium.

Cancer may occur in almost every organ or tissue in the human body. Those that occur in the mouth, on the lip and the skin are easily recognized when they begin to grow. They usually start as a sore or ulcer which does not readily heal. Most of the deeper cancers are not easily recognized, but they nearly always give some symptoms. Cancer of the stomach is associated with digestive symptoms. Such symptoms occurring especially after the age of thirty demand an immediate examination by your doctor. X-ray is one of the methods used to discover early cancer of the stomach. Cancer of the bladder and of the urinary tract is often characterized by the presence of blood in the urine. Cancer of the large intestine is associated with blood or mucus in the stools.

Moles on the skin are very common and nearly everyone has them. There are two types of moles: one is the flat mole which rarely, if ever, becomes cancerous, and the other is the elevated mole. If an elevated mole occurs in a place where it is liable to become irritated it should be removed. Do not wait until it becomes deeper in color or bleeds easily. When this happens it has already become malignant and the chances of cure are greatly diminished.

---

* By Burton T. Simpson, M. D., Director of the State Institute for the Study of Malignant Disease, Buffalo, N. Y.

White patches on the tongue or the lip from excessive use of tobacco frequently become malignant. A single lump in the breast of a woman, especially after the age of twenty-five, is a serious condition which demands immediate medical attention.

In all hospitals where cancer is treated it is the general experience that many patients have delayed in consulting their doctor. These patients become hopeless before a chance for curative treatment is obtained. One of the disappointing circumstances to physicians who treat cancer is the fact that many patients could easily have been cured if they had not delayed in seeking medical advice.

Statistics show that the cures obtained in cancer are in direct proportion to the interval between the time the patient first observed symptoms and the time when he consulted a doctor. The shorter this period was the greater the number of cures obtained, and the longer the interval the greater the number of deaths. Many people fear cancer because they believe it is incurable. This is an erroneous belief and is founded upon the fact that many people neglect the disease when they first discover it and only come for consultation when the cancer is advanced. There are thousands of people living who have been completely cured and remain free from the disease. It is needless to say that the majority of these consulted their doctors at the first appearance of symptoms.

Today we have excellent facilities for the diagnosis and treatment of cancer. Tumor clinics have been established not only in the large but in the smaller communities, and if we are to control this disease it is necessary for everyone to avail himself or herself of these facilities immediately upon the appearance of abnormal symptoms of any nature. I think you will agree with me, after this brief survey of the subject of cancer, that the necessity for seeking medical advice at once for any of the conditions mentioned above is imperative and that to neglect to do so substantiates the assertion that "Procrastination is the thief of life in cancer."

MENTAL HOSPITALS

Current incidence rates indicate that one of every twenty persons born in 1938 will be committed to a mental hospital some time during his life span.

Because of the increasing proportion of the population in the older age groups, an increase in the number of admissions to mental hospitals is to be expected in the future, since rates of mental disease are highest in the older age brackets.

Since there is no sharp line of demarcation between normality and abnormality, it is practically impossible to determine whether the relative number of persons with mental disease is increasing.

Fundamentally, even though there is a definite physical basis for many mental disorders, mental disease—or insanity, as it is popularly called—is a cultural concept, and varies from one group to another. In some situations the mentally deranged have become soothsayers, medicine men, prophets, or leaders; in other situations the same persons would be incarcerated.

These conclusions have been developed from a comprehensive study of recent data by Dr. Harold F. Dorn, statistician, United States Public Health Service. They are discussed by him in a paper, "The Incidence and Future Expectancy of Mental Disease," in the current issue of *Public Health Reports.*

To a certain extent, the increase in the number of first admissions to mental hospitals merely reflects an increase in hospital facilities, Doctor Dorn pointed out. In order to eliminate this factor in so far as it was possible, the data used in this study were the number of first admissions to mental hospitals in Massachusetts, New York, and Illinois, where facilities have been fairly adequate for several years. In general, these data do not support the contention that the incidence of mental disorders had been rapidly increasing.

This does not mean, however, that the public burden of caring for persons with mental disease has not been increasing. The average number of patients in state hospitals increased 40 per cent (from 248,852 to 347,620) between 1926 and 1935. But, rather, it means that most of the increase may be attributed to increase in the expectation of life, an increasing proportion of old people in the population, increasing urbanization, and other environmental factors. As the standards of care and treatment are raised the total cost will increase, although there is no increase in the incidence of the disease. (It is estimated that the current annual cost of hospitalized patients alone is between $150,000,000 and $200,000,000, and that these patients occupy 47 per cent of the total number of hospital beds.)

It is gradually becoming accepted, according to Doctor Dorn, that mental abberation is simply a form of illness which may often be cured or alleviated by suitable care and treatment. This attitude is clearly reflected by the fact that the "insane asylums" of fifty years ago have become "mental hospitals" today. Commitment to a hospital is no longer universally regarded with the same horror as formerly.

"This change in the public attitude toward hospitalization, which has been concomitant with a changing cultural conception of mental disease, has undoubtedly increased the frequency with which cases of mild mental disorders are hospitalized," Doctor Dorn declared.

"The increasing proportion of the population living in cities also tends to increase the use of hospital facilities. Many persons who would be regarded as merely 'queer' in a rural community undoubtedly experience difficulty in adjusting themselves to an urban environment. Moreover, due to inadequate housing, low income, and the uncertainty of continuous employment, home care of nonviolent cases of mental disorders, especially those associated with senility, is more difficult in the city than on the farm.

"The two principal exogenous factors which are thought to affect the prevalence of mental disease, alcoholism and syphilis are also more common in urban communities. For these reasons some increase in the proportion of the population thought to be mentally ill is to be expected even if there has been no real increase in the incidence of mental disorders."

However, it is impossible to determine whether or not this is true because there is no practical method of determining the incidence of mental disease either at the present time or in the past. Regardless of the amount of mental illness in the population, it must be measured by the number of mental cases recognized and committed to an institution.

"This method of measurement is not so unsatisfactory as might at first appear," said Doctor Dorn, "since cases of mental disease become a public burden only after they are recognized. Therefore, instead of speaking of the number of persons with some form of mental disease, a number which is unknown, it becomes necessary to restrict this discussion to the number of persons who are committed to a mental disease hospital. This does not, of course, include all persons with a mental disorder but merely those who have been recognized as needing institutional care and for whom hospital facilities are available."

Even if mental abberation apparently is not increasing appreciably, its importance should not be minimized, the statistician warned.

"The loss in future productive power as well as the cost of caring for this number of patients," he concluded, "emphasizes the importance of developing a thorough mental hygiene program. This is all the more important since the total burden of caring for the mentally ill is almost certain

to increase even though there is no increase in the incidence of mental disease at each age. Changes now taking place in the national population presage an increase in the number of mentally ill in the total population because a larger portion of the population will be in the age groups when mental disease is most frequent. Assuming that the commitment rates for mental disease for the total United States are no greater in 1960 than they were in New York State during the three-year period, 1929-1931, it is estimated that about 135,000 persons annually will be committed to a mental hospital for the first time. This is nearly twice the present number of first commitments."

Only a few hundred years ago, the violently insane were thought to be possessed by demons and frequently were

illed or forced to leave the community. With some modi-ication, mainly the substitution of incarceration as a nethod of treatment, this idea of "insanity," as it was alled, prevailed later—indeed still prevails—in some laces. With increased knowledge of the functioning of the uman body, however, the concept of mental ill health has radually expanded until today it includes many conditions formerly considered normal. The recognition that mental ill health is more prevalent than hospital admissions reveal has led to the establishment of child guidance clinics, the employment of psychiatric social workers, the addition of psychiatrists to the staff of hospitals, prisons, and similar institutions, to devoting special attention to problem children in school, and to various adult education programs.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XII, No. 1, January, 1914

From Some Editorial Notes:

New Year—New Opportunities.—With its three hundred and sixty-five clean, unmarked pages, a new year has come to us to use or abuse; to write things upon them that will endure and be of benefit to the people, to the profession of which we are humble units, to the communities in which we severally live and work and have our influence; or to be left blank, soiled, scrawled upon or smudged. There is enough to do, God knows, in the way of helping ourselves and of helping the people whose needs and ills and sufferings we tend; and we must not forget that in helping ourselves to a better living, to a fuller life, we are helping the people. A physician poor in purse is handicapped to the extent that he cannot provide himself with the proper things of knowledge or material equipment with which to give the best that is in him to his patients. This we should not fail to recognize or to make our patients understand, as we have opportunity from time to time. There is nothing in the world more dangerous than a cheap lawyer except a cheap doctor. Let the new year see you follow more accurate and careful business methods in dealing with the business side of your work; no one respects the man he can defraud or cheapen, and your patients will respect you more for it. Do not let your accounts run for a year or two and then try to collect what you can; send out your bills promptly, and after a year of moderate effort to collect see that the debtor is forced to pay, if he is in a position to do so. . . . Above all, do not forget to do your own best work for the benefit of your own county medical society; it will help you and will help every member of the profession and will stimulate a greater respect for the entire profession in your community. Nothing hurts us all so much as rows among medical men themselves. A fight between two physicians not only hurts them both, no matter which one is in the right, but it hurts the whole medical profession by belittling its members in the eyes of the community. In every county where you find a good, active, well-knit county medical society, there you will find the medical profession looked up to and respected. There is plenty to be written on these clean pages of this year's new book; will you write something worth while?

* * *

Union Health Departments.—All over the country cities are engaged in becoming acquainted with themselves by means of efficiency surveys. These surveys have grown out of the perfectly natural desire of the taxpayer to know how his money is being spent, and whether he is getting value received. Wherever these surveys have been instituted, the health department is primarily the one which shows marked weakness in comparison to the other departments of administration. The reason of this is evident. As long as city councils and county boards of supervisors have the impression that the chief functions of a health department are limited to the placarding and fumigation of habitations after certain diseases, and the investigation and removal of the causes of bad smells, so long will the appropriations for health work continue to be inadequate. . . .

* * *

Public Health and Interference.—It seems a curious fatality to announce in a special health number of the JOURNAL the fact that the Secretary of the State Board of Health has resigned his office because of the intolerable interference with his work by some petty-minded laymen who really have nothing to say about it but who have usurped the right to say how every dollar of the money spent by the Board of Health shall be expended. Were it not a matter of the greatest importance to the people of the state, it would be farcical in the extreme. Doctor Snow has for several years served the state as Secretary of the State Board of Health and has served it intelligently and faith-

"Dr. Morton R. Gibbons, Sr., noted surgeon in his own right and fifth in a family of medical men, will be in charge of the hospital to be operated at Treasure Island next year. . . . The hospital probably will be manned by three or four doctors and an equal number of nurses. . . ." (San Francisco *Chronicle,* November 4, 1938.)

"Dr. Aaron J. Rosanoff, fifty-nine, operator of a private San Gabriel sanitarium and member of the Los Angeles County Lunacy Commission since 1923, today was appointed director of state institutions by Governor-elect Culbert L. Olson. He will take office January 2. He is a charter member and former president of the Southern California Academy of Criminology." (San Francisco *Call-Bulletin,* December 5, 1938.)

"Because the only testimony against him was that of accomplices, Dr. Edward H. Anthony, physician, yesterday was granted a new trial on charges of participating in a fake-accident insurance swindle. The District Court of Appeal reversed the conviction by a jury in Superior Judge Charles Fricke's court, with the declaration that: 'After eliminating the testimony of accomplices, the record is devoid of any evidence, even slight, to connect Doctor Anthony with the commission of the crimes charged. The only evidence, excluding that of accomplices, is that Doctor Anthony treated the alleged injured persons, thereafter participating in discussions for the settlement of their claims and receiving in payment of his bill for professional service a portion of the money paid on these claims. These fees were not excessive.' The case was one in which three persons confessed they faked injuries to collect insurance. Doctor Anthony testified he believed their injuries legitimate and had no part in any criminal activities. . . ." (Los Angeles *Examiner,* November 19, 1938.)

"R. T. Church, forty-eight, foot ailment specialist, yesterday pleaded guilty to practicing medicine without a license in Police Judge E. E. Breitenbucher's court and was fined $100. Judge Breitenbucher also suspended a 180-day jail term, after Church admitted violations of the California Medical Act. He was arrested by Detective Sergeant Frank Ingalls and Detective Walter McLachlan." (Stockton *Independent,* November 11, 1938.)

"Denying his plea for probation, Superior Judge Lincoln S. Church today sentenced Dr. Boyajian B. Arman, fifty, to a term of one year in the county jail for unlawful possession of a narcotic." (Oakland *Post-Enquirer,* November 16, 1938.)

"Dr. John E. Baker, former Hollywood police surgeon, convicted as one of a fake accident ring conspiring to defraud insurance companies, will be paroled from San Quentin next April 2." (Los Angeles *Examiner,* November 18, 1938.) (Previous entries, July, September, 1937; April, 1928; September, December, 1937; January, April, 1938.)

" 'This court feels that this woman, who is not opposed to surgery, let her son die a horrible death because she refused to consent to an operation on the boy even after being warned his life depended on it.' The above statement was directed yesterday by Superior Judge A. A. Schott against Mrs. Lillian Volstad, whose son, Francis Warren Volstad, nine, died in General Hospital of a ruptured appendix. In commenting on the pitiful tragedy the jurist explained the mother refused to accompany her dying son to the hospital, adding—'And so we have the sorry spectacle

ONLY THESE SOLUTIONS ARE VACOLITER PROTECTED

BAXTER'S

INTRAVENOUS SOLUTIONS IN VACOLITERS

Baxter's can help your patients and your budget

With Baxter's on your shelves you *know* you've provided fine, safe products for intravenous infusions. You *know* each lot of Baxter's has been tested and retested by *experts* to protect you and your patients. You *know* each Vacoliter of Baxter's is sealed from contamination . . . from prying fingers . . . by a strong *metal* seal.

All these things need not cost you any more than you pay today for intravenous solutions and you may find Baxter's, with all their extra advantages, actually *less expensive* than hospital made solutions . . . for Baxter's save you the expense of wastage . . . labor . . . replacements on intravenous equipment and a dozen hidden costs that sap your budget. With Baxter's you need never choose between a patient's safety and a balanced budget . . . Baxter's can help you gain *both*, because Baxter's are as safe and fine as you could ask . . . and they are priced to keep your costs in line with what you can afford.

What Type of Formula *Agrees* with the *Newborn*?

INFANT FEEDING PRACTICE POINTERS

Answers to Physicians' Questions

1. Q. What is the composition of a whole milk formula for the newborn?

   A. *Whole milk, 10 ozs. Boiled water, 10 ozs. Karo Syrup, 2 tablespoons.*

2. Q. What is the composition of an evaporated milk formula for the newborn?

   A. *Evaporated milk, 6 ozs. Boiled water, 12 ozs. Karo Syrup, 2 tablespoons.*

3. Q. What is the composition of an acid milk formula for the newborn?

   A. *Lactic acid milk, 12 ozs. Boiled water, 8 ozs. Karo Syrup, 2 tablespoons.*

The nutritional requirements are met by simple mixtures of cow's milk, sugar and water when the newborn is deprived of breast milk. Infants with good digestive capacities tolerate whole milk mixtures and those with low digestive capacities tolerate evaporated, dried and acid milk formulas.

But any of these milks can safely be modified with Karo. It is adapted to every type of formula devised for young infants. The amount of Karo added is usually one-third of the total required calories. Karo provides a large proportion of dextrin with relatively small amounts of maltose, dextrose and cane sugar.

AMERICAN MEDICAL ASSN.
Council on Pharmacy and Chemistry

If they could talk, Council Seals would say:

"When you see one of us on a package of medicine or food, it means first of all that the manufacturer thought enough of the product to be willing to have it and his claims carefully examined by a board of critical, unbiased experts . . . We're glad to tell you that this product was examined, that the manufacturer was willing to listen to criticisms and suggestions the Council made, that he signified his willingness to restrict his advertising claims to proved ones, and that he will keep the Council informed of any intended changes in product or claims . . . There may be other similar products as good as this one, but when you see us on a package, you know. Why guess, or why take someone's self-interested word? If the product is everything the manufacturer claims, why should he hesitate to submit it to the Council, for acceptance?"

THE FOLLOWING MEAD PRODUCTS ARE COUNCIL-ACCEPTED: Oleum Percomorphum (liquid and capsules); Mead's Cod Liver Oil Fortified With Percomorph Liver Oil; Mead's Compound Syrup Oleum Percomorphum; Mead's Viosterol in Halibut Liver Oil (liquid and capsules); Mead's Cod Liver Oil With Viosterol; Mead's Viosterol in Oil; Mead's Standardized Cod Liver Oil; Mead's Halibut Liver Oil; Dextri-Maltose Nos. 1, 2, and 3; Dextri-Maltose With Vitamin B; Pablum; Mead's Cereal; Mead's Mineral Oil With Malt Syrup; Mead's Brewers Yeast (powder and tablets); Mead's Thiamin Chloride Tablets; Mead's Cevitamic Acid Tablets; Mead's Powdered Protein Milk; Mead's Powdered Whole Milk; Mead's Powdered Lactic Acid Milk Nos. 1 and 2; Alacta; Casec; Sobee; Cemac; Olac.

THE FOLLOWING NEW PRODUCT IS BEFORE THE COUNCIL ON PHARMACY FOR ACCEPTANCE: Mead's Nicotinic Acid Tablets.

Copyright 1936, Mead Johnson & Company, Evansville, Indiana, U.S.A.

Every Product Exhaustively TESTED!

Physicians must have preparations the ingredients and efficacy of which are of unquestioned value. The steady growth of The Smith-Dorsey Company from 1908 is the best indication that our products measure up to these requirements.

PHARMACEUTICALS
YOU CAN PRESCRIBE WITH CONFIDENCE

Every Smith-Dorsey product is safeguarded in three ways:

1. We operate a control laboratory for the purpose of testing raw materials for purity.
2. Finished products are thoroughly tested for conformity to label statements.
3. No new products are released without subjecting them to physiological tests.

Our laboratory is modern and complete and is manned by competent university trained chemists. No expense is spared to make research complete. No preparations are ever offered the laity.

Such is the background of Smith-Dorsey products.

Public Health grew out of attempts to protect people against plagues and epidemics. Most of the ancient enemies are baffled—the defense warfare has been successful. Now public health is aggressive; it no longer waits for attack, but armed with the weapons of modern medicine, it strikes first. It anticipates attack by building health into the growing bodies of children and by planting health ideas in their plastic minds and it utilizes the weapons furnished by that quiet army of research workers that labors on untiringly, adding always more knowledge and power.

RECENT ADVANCES IN THE SCIENCE OF NUTRITION

V. Factors Affecting the Vitamin C Contents of Foods

● Recent development of the chemical method for estimation of ascorbic acid (1) has permitted more thorough study of factors determining the vitamin C contents of foods. Circumspectly used, the 2, 6 dichlorphenol-indophenol or "indicator" titration method for vitamin C determination has proven an invaluable tool in this phase of research.

It is now apparent that the vitamin C content of food at the time of consumption is conditioned, first, by the initial ascorbic acid content of the food at the time of harvesting, and second, by the treatment to which the food is subjected between the time of harvesting and the time of consumption.

The initial vitamin C level in raw foods has been found to depend on factors such as variety, maturity and growing conditions (2). Under usual conditions of food crop production, such factors are only partially subject to human control. However, the factors influencing vitamin C in foods from harvesting until consumption are capable of closer regulation by man.

For example, it is known that long storage at improper temperatures adversely affects the initial ascorbic acid contents of foods. Even at refrigeration temperatures raw foods may lose substantial amounts of vitamin C during storage. Rough handling—which causes rupture of vegetable tissue—is also conducive to vitamin C loss especially when followed by improper storage. Certain metals will catalyze vitamin C destruction and even commonly used home-cooking methods are attended by losses of this essential dietary factor (2).

Briefly, preservation of vitamin C in foods between harvesting and consumption is essentially a problem of preventing or reducing oxidation, either enzymatic or atmospheric. In addition, physical or solution losses must be minimized in preparation of the food for the table. It is pertinent to note that modern commercial canning procedures are well adapted to control both these chemical and physical losses of vitamin C (3).

The use of prime raw stock and quick transport to the cannery after harvesting; rapid inactivation of enzymes through heat treatment; and large scale automatic operations with minimal exposure to air, are basic practices common to all modern canning procedures. All serve to check oxidative losses of the initial ascorbic acid present in raw foods. In addition, during canning, the foods are cooked by the heat process while contained in the sealed can. The liquid within the can, therefore, retains vitamin C which has been removed from the food by solution.

Researches have shown that many commercially canned foods are to be listed among the most valuable contributors of vitamin C to the diet of the American people (2, 3, 4). Such findings demonstrate the effectiveness of modern commercial canning procedures in preservation to the highest practical degree of the initial vitamin C contents of foods.

"Two Generations of Appliance Makers"

Radio Program: On the State Humane Pound Act.—The proposed initiative law No. 2 (State Humane Pound Act) had a place on the November 8, 1938, state election ballot. The measure was defeated by a more than two to one vote of the people. The proponents of the measure had the support of a large newspaper chain, its papers giving almost full-page display articles in favor of passage of the measure. In previous issues, in the editorial and other departments of CALIFORNIA AND WESTERN MEDICINE, appeared articles in which the campaign of the workers against the measure was outlined.

The educational work was largely centralized around the distribution of post-cards and literature. Here and there radio time was secured. The script of one of the radio hours, as put out by Mr. Stanley Cochems, Executive Secretary of the Los Angeles County Medical Association, has recently come into our possession. It is printed for its informative and suggestive value and should be of interest to all who may have occasion to use the radio networks in publicity work. The dialogue follows:

* * *

Music (Record): A few bars from "The Whistler and His Dog," including the whistling phrases, fading to the announcer.

Announcer: Everyone who has a spark of love within him loves his dog. Some of the world's most heroic acts might well be inscribed in bronze under a dog's name. Our dogs love us; they trust us implicitly; they expect us to protect them. In the interest of dogs and in the interest of humanity the following broadcast is dedicated. Mr. R. Allen Wilson, educator, and Mr. S. K. Cochems, representing one of Southern California's largest scientific organizations, will discuss Proposition No. 2, the Bill to Regulate Pounds. We present Mr. Wilson and Mr. Cochems.

Mr. Wilson: Just before we came in, Mr. Cochems, you said it was a pity that some sincere folks might vote "Yes" on Proposition No. 2, tomorrow. That is the so-called Humane Pound Act. You have two dogs and I have one, and we care a great deal for them. Don't you want them protected by this proposed legislation?

Mr. Cochems: I said it was a pity because I am very, very fond of dogs. I don't want them to suffer simply because a few misinformed or, rather, prejudiced individuals have stirred up a storm of emotionalism, and have done this, not to protect dogs, but to serve their own selfish pride, or their own selfish interests.

Proposition No. 2 is not a humane pound bill—it is an antivivisection measure fostered by drugless practitioners and others who are jealous of, or who deny the value of, scientific advance—who would stifle scientific research.

Proposition No. 2 would rob our dogs, as well as ourselves, of much of the merciful treatment now accorded to alleviate suffering.

Mr. Wilson: But I have been told that Proposition No. 2 was designed to do just what you say it will not do, that it would protect our pets from what has been pictured as inhumane treatment.

Mr. Cochems: My dog, Skippy, demonstrates what I mean. Skippy is a black Cocker Spaniel. A year ago I was out on the lawn with him. Skippy suddenly decided to run across the street. He dashed down the lawn, his long ears flopping—you know what a picture a Cocker makes when he is in a hurry—and Skippy was in a hurry. He didn't see the car that hit him . . .

As soon as my car slid to a stop in front of the veterinarian's office, Skippy's doctor ran to the curb and slipped a hypodermic needle somewhere into Skippy's hide. In ten seconds Skippy was asleep, completely under the effect of the anesthetic, nembutol!

If Skippy could know, he would be grateful for humane animal research. Thanks to nembutol, he was saved hours of excruciating pain while his doctor set the broken bones and formed the cast.

Nembutol and other products, made possible only by animal research, are used many times every day to relieve

(Continued from Preceding Page)

the suffering of animals as well as the suffering of human beings.

For this reason the Southern California Association of Small Animal Hospitals has gone on record opposing this proposition. Your dog's doctor should know what is good for your dog.

Mr. Wilson: You mean that without animal research anesthesia would not be available today? That is a statement of vital importance to every one of us. Then you mention "other products"—just what do you mean by that?

Mr. Cochems: There is not a single individual listening to us, Mr. Wilson, who does not have some fear of death by heart failure. There isn't a single listener who doesn't know of someone with heart trouble.

Have you ever witnessed a heart attack? That heart may be just fluttering—that person is very close to death. And then that product of scientific research—digitalis—is administered, and almost instantly that fluttering heart resumes its strong beating again. A life is saved for months and possibly years.

Digitalis is made possible only by animal research to test its potency before it may be administered. Proposition No. 2 would deny the countless thousands of heart sufferers the added years of life that now have been given to them.

Everyone who reaches the middle years of life knows a friend, a relative, who has diabetes. Proposition No. 2 would sign the death warrant for diabetics. Every batch of insulin—which is the one thing that allows the diabetic to live a normal life—must be tested—humanely, of course—upon animals to determine its potency. Proposition No. 2 would take insulin away.

Think of your friends, your relatives, or perhaps yourself in connection with insulin and diabetes, and you will vote "No" on Proposition No. 2, the antivivisection measure.

Mr. Wilson: As a dog owner, I have never found where a valued pet was in danger of being used for research.

I have owned three dogs that had to be put to sleep for their own good. In replacing them it was suggested that I might find a suitable pet at the pound. Upon looking over the dogs that could be released, there was not a single, well-kept pet in the lot; not a single dog that I would dare to take home.

This impressed me greatly with the fact that true dog lovers take care of their dogs. Desirable pets seldom reach the pound, or if they do by accident, are reclaimed within a few hours. Consequently, it seems to me that any of the animals taken from the pound to be used for scientific purposes are those which are undesirable. However, the proponents of Proposition No. 2 state that it will not hamper animal research, that it only forces research institutions to raise their own animals.

Mr. Cochems: That may be true if these institutions would not find it financially impossible to do this. But that is not the humane issue. Several thousands stray dogs are used each year for scientific—humane—investigation. These are strays that would be put out of the way if not so used. Is it humane to force breeding of the several thousand more dogs each year just to be used for animal research, while many thousands more than these will be killed regardless, and to no better purpose than to put them out of the way?

If Proposition No. 2 is defeated the educational and scientific organizations who have defeated it will seek by legislative enactment a true humane pound law, setting up a central information bureau in Los Angeles, where any pet owner may quickly get word of his lost pet, and providing that all dogs be kept at the pound more than seventy-two hours. That unclaimed strays be turned over only to accredited research and educational institutions.

Mr. Wilson: Can you clear this up, Mr. Cochems? I have read in certain of our daily papers that an eminent physician, a Dr. Wolf Adler, stated that animal research was no longer needed. Isn't he an authority?

Mr. Cochems: Absolutely not. This man Adler has talked a lot, and has been referred to as an eminent physician, as having been at one time connected with Bellevue Hospital in New York. Here is a wire from Dr. W. F.

Jacobs, Superintendent of Bellevue Hospital: Quote: "No record of Wolf Adler having been connected with Bellevue Hospital." End quote.

Adler's name is not in any directory of doctors of medicine. In a list of licentiates published in California, Adler's name appears under "Drugless Practitioners"; listed as a chiropractor. He appears to be the one so-called scientific authority cited by proponents of this proposition.

To refute his statements allow me to name only a few of the thousands of authorities who state that animal research is vital to the health of our people today, authorities who also state that Proposition No. 2 is an antivivisection measure.

A few of these authorities are Dr. Thomas Parran, Jr., Surgeon-General of the United States; Dr. Alexis Carrel, world-famous as a research worker of the Rockefeller Institute and author of the book, "Man the Unknown." Add to these names the names of the presidents of all of California's great universities, and it scarcely seems intelligent to balance the statement of one chiropractor against the analysis of these leaders who are attempting to protect the people of California from themselves.

Mr. Wilson: Sufficient evidence, certainly, Mr. Cochems, but I am still curious about one thing. Why have some of our newspapers given so much space in favor of Proposition No. 2 and presented pictures to indicate that animals are tortured? Here is a picture of a dog with a thumb screw devise in his mouth. That is graphic evidence, is it not, that dogs are tortured in the name of science?

Mr. Cochems: Graphic, indeed, Mr. Wilson, but not of torture. It is a very graphic picture of the steps the antivivisectionists will take in the name of propaganda.

But, first, only certain papers here and papers under the same ownership in San Francisco gave all this favorable publicity to this proposition. When pride or vanity is hurt, strange things may happen.

You read the October 24 issue of *Life*. Eight pages devoted to the antivivisection battle in California. You will recall that one page printed the pictures of Irene Castle McLaughlin and Marion Davies as the leading antivivisectionists, stating they supported Proposition No. 2. These pictures were followed by seven pages to illustrate the value of animal research. Under Marion Davies' picture, *Life* stated: "Actress Marion Davies is the most powerful antivivisectionist through publisher-friend William Randolph Hearst." That may answer part of your question, Mr. Wilson.

And here is the story of the dog and the thumbscrew gag. That dog is very old. The picture was printed twenty-five years ago. You may see that same dog today. Yesterday he was in the basement of the Bradbury Building—with the other horrors—the gag in his mouth. Stuffed! A stuffed dog—an example of a taxidermist's art plus the work, probably, of a Hollywood prop man who devotes his time to creating instruments for horror films.

Here is a new picture of that dog we took yesterday. You can see that the dog is stuffed. That picture was created solely for the purpose of attempting to make people believe that dogs are tortured in the name of scientific research.

When fanaticism needs propaganda, it appears that anything goes. Rather enlightening that their major argument is based upon deliberate deception in the name of humanitarianism.

Mr. Wilson: Mr. Cochems, aren't there any sincere people supporting this proposition? I mean people who know? It seems there have been many Hollywood names, celebrities, mentioned as urging the passage of Proposition No. 2.

Mr. Cochems: Not all of Hollywood. Louis B. Mayer of Metro-Goldwyn-Mayer, is a member of the executive committee, composed of California's most prominent citizens and educators, who are fighting this Proposition. They know it is especially dangerous to the health of the people of California.

You ask, Mr. Wilson, why certain motion picture stars are making personal appearances in favor of this Proposition. There are several reasons. Some of them are not so nice.

Publicity is life to a motion picture actor or actress. Publicity is obtained through the press. One special star has been mentioned. Now is the connection clear?

To accede to a request to appear in favor of this Proposition, if such a request comes from one high in the motion picture world, might logically be deemed to be the diplomatic thing to do. Dogs or babies be hanged.

And they are still talking, these motion picture actors and actresses. Some of them may be on the air tonight.

Have you seen the magazet called "The Tail Waggers?" A picture of a certain motion picture actor appeared in a recent issue. In the caption under it this actor is quoted as saying, "No one knows what true love and devotion is until he looks into the eyes of a dog."

It is said that many of them live with their dogs longer than they do with their wives.

Now, in all sincerity, there are many famous personages of the screen who are intelligent, who are highly educated, and who are scientifically minded.

These people will not lend themselves to the fostering of such pernicious legislation as is contemplated in Propo-

For Acidity and Allied Conditions, we suggest
ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

A Natural Mineral Water

sition No. 2, the antivivisection measure, and for them we have the highest respect.

For the others, some of whom may be speaking to you tonight, we trust that they are only misinformed; that some time they will realize that even in accepting publicity great harm may be done.

Mr. Wilson: From the information presented here this evening, Mr. Cochems, you have shown that science knows the remarkable discoveries and progress during the past few years through the aid of animal research, is only an indication of what will be accomplished for the benefit of mankind in the future; if science can continue its work unhampered.

Mr. Cochems: Right, Mr. Wilson, and don't forget that continued use of the various discoveries we accept as commonplace today is dependent entirely upon availability of animals for humane scientific research.

If you love your dog, if you love your children, if you have any love for humanity—then, in humanity's name, vote "No" on Proposition No. 2, tomorrow.

(Music—From the "Whistler and His Dog," fading out to station announcement.)

Industrial Laboratories and Clinical Research.*—What E. R. Squibb and Sons have undertaken, in the creation of this laboratory, illustrates a modern point of view of industry, involving more appreciation than formerly of social responsibility, and readiness to devote some part of earnings to the welfare of society. The development of this point of view, as I shall emphasize, is good insurance, indeed I may say necessary insurance.

Drs. William and Charles Mayo, talented as surgeons, and fortunate in environment and time, were so successful financially in the early years of their practice in Rochester, Minnesota, that they easily could have amassed large fortunes. Instead, they set aside from their earnings any sums in excess of what was necessary to provide circumstances of living favorable for their work, and later when they assembled a staff of physicians to share their labors, they themselves and the members of the staff received salaries, while all accumulations over and above these and other necessary expenses continued to be set aside with the definite purpose from the beginning of returning such money to the sick whence it came.

The motive was a desire to contribute as largely as possible to human welfare, combined with appreciation of danger inherent in the private possession of wealth. They expressed the belief that wealth frequently encourages waste of time and changes objectives in life; that it often takes away from sons and daughters the desire to labor and achieve, and introduces distractions whereby instead of developing into useful citizens the younger members of affluent families sometimes become dissolute.

How to restore to the sick the money which had grown by fortunate investments of sums collected as fees, then amounting to a million and a half dollars, was decided upon in 1913. In that year they gave the entire amount to the University of Minnesota to establish The Mayo Foundation for Medical Education and Research. The same policy continues. Relatively modest salaries are received by the members of the staff of The Mayo Clinic, salaries comparable to those paid by universities; running expenses are met and the balance is returned to the sick through The Mayo Foundation, in the form of advanced medical education for developing better-trained physicians, and as laboratories for research.

By older rules the procedure of the Doctors Mayo would be regarded as poor, if not suicidal, business practice; but standards are changing and that the older rules were not infallible is indicated by the continuing success of the enterprise conducted by the Mayos. Also that the profit motive, which must actuate private business enterprise, is not

* Address of Dr. Russell M. Wilder, Ph.D., M.D., of the Department of Medicine of The Mayo Foundation, Rochester, Minnesota, which was delivered at the ceremony dedicating the Squibb Institute for Medical Research, New Brunswick, New Jersey, on Tuesday, October 11, at 1 p. m.

Points and Views on the SERUM THERAPY OF PNEUMONIA

"Treatment of pneumonia has always been full of dangers. It has today, though new hopes exist, even more dangers. The dangers of delay in diagnosis, of incorrect typing, of sensitivity of patient, of overshadowing of other care by serum therapy, of failure to regard the disease as an emergency; all these dangers have been added."

—IRVING, NEW YORK STATE JOURNAL OF MEDICINE, JAN. 15, 1938.

"The traditional distinction between lobar and broncho-pneumonia is important as far as the niceties of accurate anatomical physical diagnosis are concerned. However, the etiological diagnosis is much more important since the intelligent treatment of the patient depends upon it."

—NEW YORK STATE JOURNAL OF MEDICINE, JAN. 15, 1938

"The effectiveness of serum therapy is multiplied by early administration and it is not wise to delay its use 'to see if it should become necessary.' A positive blood culture of Type 1 or Type 2 pneumococci renders serum therapy nearly obligatory."

—HINSHAW, JOURNAL-LANCET, AUGUST 1937.

Get its number!

All pneumococcus pneumonias should be promptly typed to the point of affirmatively establishing the specific type number.

"PNEUMOCOCCUS TYPING SERA (RABBIT) *Lederle*" are available for all 32 listed types of pneumococcus pneumonias.

irreconcilable with active support of public interests is shown by their exceptional example.

Other examples equally exceptional may be named, but I suggest that procedure like theirs will need to become the rule and not the exception if capitalism is to weather successfully the troubled times confronting us. Capitalistic democracy today is under fire as never before. Competing systems are established over a large part of the world, and the success of ours in promoting the public welfare will alone insure its continuance. Its most dangerous enemies are vain men who think their successes are owing exclusively to themselves, selfish men who demand much but give little, and stupid men out of touch with changing standards of morality and social-mindedness. Loud denunciation of other social systems can avail little to insure the success of ours. We shall be known only by our works.

It is especially important for the pharmaceutic industry clearly to perceive its responsibilities to the public, because the profits of this industry, like those of the profession of medicine, come from persons who because of loss of health are least able to contribute to profits. A considerable part of the cost of medical care which today is under public scrutiny goes for drugs and, as you know, much of this part is wasted; because frequently either the drugs are worthless, or they are not needed, or they are used improperly. To remedy these shortcomings of pharmaceutics and pharmacology is a clear responsibility of the pharmaceutic industry, but at this time I wish especially to emphasize the importance of doing all that can be done to promote a better understanding of the action of medicinal preparations through extension of facilities for research in therapeutics.

Medical science, in recent decades, has developed principally in laboratories of animal physiology, and in consequence what we have learned about dogs and rats exceeds what we know about ourselves. This is partly explained by the greater ease of experimentation on lower animals, but also responsible in part is the disproportionately larger provision made for research with animals. It is only in very recent years that American universities have admitted clinicians to their faculties, and in only a few universities where this has occurred is provision made for as rigid investigation of clinical material as the physiologist conducts with dogs.

The cynical Bernard Shaw, in his comedy "The Doctors' Dilemma," remarked that the only excuse for vivisection was that doctors were too stupid to learn what they needed to know by the study of man. No individual of his intelligence could conceivably minimize the importance of animal investigation unless he was misinformed, but we can learn from man more than we do learn and indeed we must learn more from him, because so much of the information obtained from other animals cannot apply to man.

I have in mind the striking differences between human diabetes and the diabetes of dogs after pancreatectomy. I think likewise of the distribution of potassium which in the human being is largely intracellular, and in the dog is divided more equally between the cells and the plasma of the blood, explaining, it may be, the unlike response to treatment of adrenalectomized dogs and patients with Addison's disease. Dissimilar also are the distributions of cholinergic and adrenergic nerve fibers in man and dog, accounting for sweating in the one and not in the other, and underlying, it may be, species differences in susceptibility to toxins and drugs.

However, as was intimated by Mr. Shaw, research on man demands more and not less refinement of method, much more critical judgment and more rigid control. Otherwise the result is that of which we have had far too much already, extravagant theory, supported by imperfect observation, conducted under conditions which well-nigh exclude the possibility of scientific precision of observation.

What we require more of is the type of establishment represented by the Rockefeller Hospital in New York, in which the physician is also a disciplined investigator, nurses and technicians are trained in scientific methods, and patients who volunteer to be subjects of research can be maintained without expense to themselves as long as is

(Continued on Page 48)

A Business HYPODERMIC

THE revival of business is largely dependent upon forward-looking business men with faith and vision. Lack of confidence, reflected by curtailment of advertising and printed matter, is easily sensed by the buying public. Business men no longer can lay the onus to the consumer—it is up to them to lead the way.

Having determined that printed matter is a much needed Business Hypodermic, the buyer should check up his printing connections. There are only three general considerations to weigh in this regard: GOOD PRINTING — PROMPT DELIVERY — FAIR PRICES!

When these requirements are fulfilled, the buyer is getting SERVICE—the kind of service which has placed The James H. Barry Company among the leaders of the Printing Craft in San Francisco. This position has been attained by being constantly alert to the requirements of the buyers of printing for over a period of fifty years.

Although specializing in publication, book and catalog printing, we are daily producing some of the finest specimens of color printing in pamphlets, broadsides and folders.

Our customers are our best salesmen!

desirable from the standpoint of the research involved. Less pretentious, but similarly effective, are the Thorndike Laboratories in the Boston City Hospital, and a very few other similar research units within other hospitals. It is almost hopeless, as all with experience will agree, to obtain rigid control of investigations conducted in the wards and rooms of general hospitals. Scientific nursing and closely approximated special laboratories are indispensable for this type of research.

What I am urging is not an extension of facilities for the clinical observation of patients. Abundant provision already has been made for this purpose and skillful physicians are numerous. The need is for laboratories of clinical research where problems involving human therapeutics can be attacked with a precision of method equal to that in which the biologist is disciplined, and where the research is undertaken by men possessing training both in biology and medicine.

Few physicians have acquired the scientific discipline demanded for such research. This accounts for the lack of repute as scientists in which many of us are held by colleagues in the so-called fundamental departments, but likewise few biological chemists or physiologists, lacking clinical experience, are able to envisage problems involving therapeutics with the dispassioned judgment to be expected of them from their scientific tutelage. This is common knowledge; however, investigators who are adapted for critical studies of the type we require can be found in sufficient number when places for them are provided.

Among the younger physicians of today are many who, before or after completing their medical education, have been trained in physiologic or biochemical investigation. The fact is demonstrated every year by the program of the American Society for Clinical Investigation and that of the Central Society for Clinical Research. What such men need to accomplish the most of which they are capable are full-time positions which carry some assurance of security, more relief than they now have, in most cases, from the

(Continued on Page 50)

IN DEPRESSIVE STATES

In depressive states, the suitability of 'Benzedrine Sulfate' (amphetamine sulfate, S.K.F.), as well as its correct dosage, must be determined for the individual patient.

Tentative classifications, however, suggest that 'Benzedrine Sulfate' is most likely to be of use in conditions characterized by diminution of capacity for activity, and that it is apt to be contraindicated in anxiety states accompanied by agitation. In depressive psychopathic states the patient should be institutionalized during the administration of 'Benzedrine Sulfate'.

Initial dosage should be small, ranging from a minimum of 2.5 mg. (¼ tablet) to 5 mg. (½ tablet). These should be regarded as test doses, and if no effect is obtained from the smallest amount given, the dosage may be progressively increased until a definite effect manifests itself. Usually it is unnecessary to give more than 10 mg. at a single dose. Careful medical supervision during this test period is particularly desirable.

When the correct dosage has been determined, it may be given two or three times a day, bearing in mind that administration in the late afternoon or evening may interfere with sleep. When divided doses are required, the specially grooved tablet may be broken and one-half or one-quarter tablet given.

The effects of 'Benzedrine Sulfate', whether desirable or undesirable, are usually apparent with the first few doses. If there are undesirable effects 'Benzedrine Sulfate' obviously should be discontinued.

BENZEDRINE SULFATE TABLETS

Each 'Benzedrine Sulfate Tablet' contains amphetamine sulfate, 10 mg. (approximately ⅙ gr.)

The Council on Pharmacy and Chemistry of the A. M. A. has adopted amphetamine as the descriptive name for α-methylphenethylamine, the substance formerly known as benzyl methyl carbinamine. 'Benzedrine' is S.K.F.'s trademark for their brand of amphetamine.

exacting and time-consuming responsibility for the care of patients, and scientifically trained nursing and technical assistance.

Research on man, I am glad to learn, is a part of the program of work contemplated by the Squibb Institution for Medical Research, through its Division of Experimental Medicine. A hospital affiliation is proposed whereby a free ward of fifteen to twenty beds will be maintained for the study of problems involving therapeutics. The field, I suggest, is one that the pharmaceutic industry might enter with great advantage.

With suitable endowments many institutes like the Thorndike Laboratories could be organized. I should like to see them located in university hospitals because only in hospitals which are integral parts of universities is the environment all that is necessary. In no place else can the clinical investigator obtain guidance from scientists on the one hand and criticism from clinicians on the other. He requires both, the former to hold him to the discipline of science, the latter to maintain the reliability of his clinical judgments.

The establishment and maintenance of the institutions proposed will involve the expenditure of considerable sums of money. On the other hand, undoubtedly they will return what is invested a hundredfold. The achievement of the Thorndike Laboratories in the treatment of anemia and that of the Rockefeller Hospital in the treatment of pneumonia are illustrations of such returns. Neither of the investigations on which these discoveries depended could have been conducted in the wards of a general hospital or under circumstances less favorable than can be provided by the kind of institution I am urging you to develop.

In promoting this type of research, or for that matter in its support of research of any variety, industry must not make the mistake of expecting "Nobel" prizes. Work of quality should be demanded, but nothing more. Important discoveries, like those I have named, may or may not re-

ward the most persistent effort. Science is a proud mistress who bestows her favors jealously, even to men who court her nobly. She resists coercion; her smiles are not for sale, and the scientist, like the artist, rarely achieves outstanding success unless he is permitted to follow his own inspirations wherever they may lead.

There is an old saying that "big money makes for bad art" and certain it is that patrons of science, like those of art, obtain more for their money when they avoid dictation. Particularly will it be important to exclude commercial considerations from laboratories depending for their support on the contributions of industry; otherwise, much will be lost, since suspicion then will attach to whatever results are obtained, and men of scientific integrity will be repulsed. Concern for human welfare should be the only motivator of endowments such as these.

Thus in offering my congratulations to E. R. Squibb and Sons for the undertaking which we now are dedicating,

(Continued on Page 54)

S.M.A. –FOR INFANTS DEPRIVED OF BREAST MILK

When diluted according to directions, S.M.A. closely resembles human milk, *NOT ONLY* in the percentages of protein, fat, carbohydrate and ash, *BUT ALSO* in the chemical constants and in physical properties.

When fed to infants as a supplement, complement or as a complete substitute for breast milk, S.M.A. consistently produces excellent nutritional results comparable to those obtained with normal breast-fed infants.

The quick, easy method of preparing S.M.A. feedings is unusually simple. A Minute Mix Method Set together with complete directions will be sent Free to physicians on request.

© S.M.A. CORP 1938

S.M.A. is a food for infants . . . derived from tuberculin tested cows' milk, the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil; with the addition of milk sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, it is essentially similar to human milk in percentages of protein, fat, carbohydrate and ash, in chemical constants and in physical properties.

ALUM ROCK SANATORIUM
FOR DISEASES OF THE CHEST

SAN JOSE, CALIFORNIA • Telephone MAYFAIR 321

On a hilltop six miles east of San Jose, commanding a view of the sunny Santa Clara Valley, this institution offers accommodations for a group of patients strictly limited by its capacity for closest individual attention. An inquiry will bring information on any phase of the sanatorium's facilities.

(Continued from Page 52)

I hope that their interest in endeavor of this kind will lead to other contributions, with particular reference to the need for more research in the field of therapeutics, and finally that the projects they do promote will always be inspired primarily by concern for human welfare.

State of California: Department of Industrial Relations.—Excerpts from a recent report to Governor's Council follow: Division of Immigration and Housing—During the month of October, 127 labor camps were inspected and 24 reinspected; 46 camps were listed as good; 67 fair and 14 bad. In the camps inspected it was found that 3,386 occupants were American-born, while 2,638 were foreign-born, making a total of 6,069, of which 2,683 were men, 1,225 women and 1,478 children.

During the month, 40 auto camps were inspected and 21 reinspected; 9 were listed as good, 17 fair, 4 bad and 10 closed. Seven trailer camps were inspected and 1 reinspected; one was listed as good, 3 fair, 2 bad and 1 closed.

One hundred and sixteen housing inspections were made; 3 were found to comply with the rules; 91 did not comply and 22 were under construction; 62 reinspections were made, in which 27 were made to comply with the rules and 35 cases pending.

During the strike in the cotton fields in Kern County the inspectors spent a good deal of time patrolling the affected area—contacting employers and employees in an effort to keep the camps up to the required standard. This work was important, but reduced the number of individual camp inspections appearing on the record.

The influx of thousands of workers and their families to the Kennett Dam area has brought about a serious situation respecting shack dwellings and general sanitation and, upon the recommendation of this Division, Shasta County has recently adopted our model squatter camp ordinance which bans the latter type of camps and embodies regulations for other camps that are not already subject to state laws. The ordinance has done much good in the counties where it is in operation and its preparation and distribution throughout the state was with the thought in mind that if this Division could not itself regulate camps under existing statutes it could put into the hands of county officials a complete ordinance draft for local enforcement.

The Division was called upon for aid in cleaning up insanitary housing conditions that existed in the City of Santa Cruz. Some of the places were found to be unfit for human habitation and have been ordered vacated or demolished.

At Gilroy, in a combination apartment house and hotel, under construction, many violations of the statute were found to exist. These violations have been brought to the attention of both the owner and the City Council for corrections to meet the requirements of the statute. Reinspection will be made for compliance with our orders.

During the month we made a special investigation of the Filipino labor situation and housing conditions in the Santa Maria Valley for the United States Department of Labor and submitted report thereon to Washington.

The usual number of marital difficulties was filed. There was also routine work on naturalization and immigration questions—mostly among the Mexicans, Spaniards, Cubans and Italians.

The records show 39 complaints, 48 applications for assistance and 45 calls for information.

In 1937, 885 deaths from venereal diseases were recorded in this state, and in 1936, 807 such deaths were registered. Without doubt, the actual numbers of deaths due to venereal diseases were much greater. A large proportion of the deaths recorded as due to heart disease were, in reality, due to syphilis. It would seem that the time may be fast approaching when the true cause of death will appear upon the death certificates.

NEW CRYSTALLIC ACOUSTICON VACUUM TUBE

HEARING AID

Now, true selective amplification with complete absence of frequency and non-linear distortion is available to the hard of hearing in the form of this new vacuum tube Acousticon Hearing Aid.

May we have the pleasure of demonstrating this truly sensational aid to a patient in your office. No obligation, of course.

ACOUSTICON

705 Foreman Bldg. LOS ANGELES
457 Powell St. SAN FRANCISCO

Acousticon is accepted by the Council on Physical Therapy of the American Medical Association.

Heart May Cause Indigestion Symptoms.—Flatulence and constipation may be forerunners of weakness in the heart, asserts Louis Faugeres Bishop, Jr., M.D., New York City, in his article entitled "Acute Indigestion—or Is It Heart Disease?" in the December issue of *Hygeia, The Health Magazine.*

Symptoms of an upset stomach which come on in later life when the heart is liable to accident may not be truly digestive. It is then the heart that is causing the stomach symptoms. Arteriosclerosis with high blood pressure is easily affected by digestive disturbances. In high blood pressure and heart disease one may have gas in the upper part of the abdomen together with tenderness and dyspepsia.

In coronary thrombosis there is frequently vomiting at the outset of the attack and a general feeling of distress which is often mistaken for "acute indigestion." In older persons acute indigestion, as such, is rather rare, because experience has taught them how to avoid foods that disagree with them.

The most commonly confused stomach-heart situation is that in which a clot has shut off the blood supply to the heart—coronary thrombosis. Should this supply be abruptly cut off, there is a tremendous shock to the whole body. Common symptoms may be not only the pain in the chest, and a sense of impending death or disaster but also nausea, vomiting and gas, just as you would feel if you had eaten some food that didn't agree with you.

These stomach symptoms overshadow the familiar symptoms and signs of shock: the cold and clammy skin, the sweating and the absence of pulse. But the ability to recognize the dread picture of coronary thrombosis in time would save many a valuable life which is lost by calling the attack acute indigestion.

The treatment of these heart attacks that masquerade as indigestion is absolute rest for the stomach and absolute rest for the heart. This means total abstinence from food for twenty-four hours, and this is difficult to enforce, because most people believe that food is necessary for life, and they won't take enough rest.

Anemia from Sulfanilamide.—Acute anemia occurred in twenty-one of 522 patients treated with sulfanilamide compounds by W. Barry Wood, Jr., M.D., Baltimore. His article on these cases is reported in *The Journal of the American Medical Association* for November 19.

The incidence was higher in children (8.3 per cent) than in adults (2.4 per cent). No definite predisposing factors were observed.

The earliest signs of the anemia appeared between twenty-four and seventy-two hours after the onset of treatment. They are as follows: (1) nausea and dizziness; (2) increased excretion of urobilin (brown urinary pigment) in the urine; (3) unexplained rise in temperature; (4) sudden drop in hemoglobin and, (5) hyperbilirubinemia (excess of red bile pigment) and jaundice.

The maximal anemia occurred usually on the fifth day, and in no case did it occur before the third or after the seventh day. The anemia is associated with acute hemolysis, but the pathogenesis is not known.

Four out of five patients in whom acute anemia had developed when first treated with sulfanilamide suffered recurrences when a second course of the drug was given.

The treatment of acute sulfanilamide anemia consists of two measures: (1) immediate withdrawal of the drug and (2) blood transfusion. Withdrawal of the drug in itself may not be effective, even when carried out early in the course of anemia. The response to blood transfusions has in all cases been satisfactory. There were no deaths.

San Francisco Fair Will Show "Microaquarium."—The spectacle of microscopic water organisms going through their daily routine of eating, resting and fighting is one of the unusual exhibits in the Hall of Science at the 1939 Golden Gate International Exposition. This unit, which is known as the "Microaquarium" is part of the zoölogical display of the University of California.

Drops of water containing the organisms will be placed on microscopic slides and through six projectors the microorganisms will be enlarged five hundred times and thrown

(Continued on Next Page)

Colfax School for the Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

Accredited by the American Medical Association and Approved by the American College of Surgeons. Open to all members of the California Medical Association. Accredited School of Nursing and Out-Patient Department.

(Continued from Preceding Page)

onto screens where their slightest movements may be seen by onlookers. The spectator will even be able to see the breathing of the organism and many of the mysteries of the cycle of life within water. Technicians will be in attendance to explain various phases of this microscopic life.

As another portion of the zoölogical display there will be five units designed to reveal many of the mysteries of embryology or the factors of growth after creation. The first will show the embryology of the salamander Triturus, revealing how the structure portion known as the limb bud on one animal may be transplanted to another, so that the second animal will develop five limbs instead of four. The entire unit will be given over to the transposing or transferring of embryonic features from one group to another and from one individual to another in the salamander. It will show the embryo carrying over the pigmentation of the original animal to the second, and likewise developing organs of the original animal or animals in the new individual or species.

The second unit will reveal embryological features of the toad and the salamander particularly in regard to glandular control. The third unit will show embryological features of the tree frog or hyla and will be a study in the development of pigmentation. The embryological development of the chick and the rat, contrasting the bird and the animal, will next be shown with lantern slides detailing the technique of this experimentation and its results. The fifth unit will deal with the early embryology of the rabbit, showing changes that occur in the rabbit egg after fertilization.

Millions of visitors are expected to visit these displays during the 288 days of the World's Fair of the West.

Pneumonia is an important cause of deaths in infants. Out of 5,060 infant deaths in 1937, 745 were due to pneumonia and 685 to diarrhea and enteritis. Diseases peculiar to early infancy caused 2,256 deaths, and congenital malformation caused 476. More than half of all infant deaths last year were due to these two causes.

VEGEX

BREWERS YEAST EXTRACT

B VITAMIN COMPLEX

EXTRINSIC FACTOR

SPECIAL PURPOSE FOOD for the VITAMIN B COMPLEX (including antineuritic B_1; riboflavin B_2; antipellagric G; complete vitamin B complex growth factor); the EXTRINSIC FACTOR and available FOOD IRON.

INGREDIENTS

A brewers' yeast extract from a salt-enzyme autolyzing process—see analysis—with added pure vegetable flavor and added available iron salt—ferrous malate.

As used, a teaspoonful to a cup of liquid, the salt concentration is less than in toast. The vegetable flavor is of possibly no physiological significance. Meat like flavor, but entirely meat free. Starch and sugar free for restricted diets; easily borne by infants and patients on liquid diets.

VEGEX ANALYSIS

	Per Cent
Protein (N × 6.25)...	32.6
Fat	0.8
Calories per ounce....	40
Sodium Chloride......	11.1
Phosphorus as P......	2.62
Potassium as K.......	2.18
Calcium as Ca........	0.098
Iron as Fe...........	0.048
Magnesium as Mg....	0.13
Copper	0.00275
Manganese	Distinct Traces

B VITAMIN TEST

Average per Gram

Sherman-Chase B_1.....	45 units
International B_1........	25 units
Sherman-Bourquin riboflavin	35 plus units
B Complex full growth	2 to 3 units

Mass clinical use indicates one man unit each anti-beriberi, anti-pellagric and extrinsic factor (anemias) per ounce.

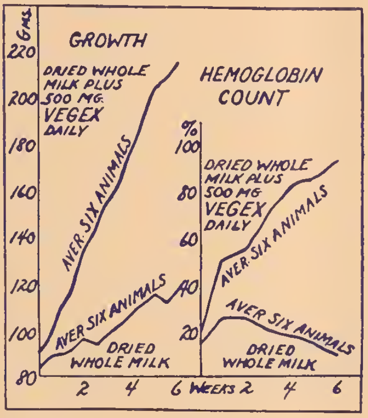
Adequate nutrition requires the whole of the vitamin B complex. Vegex supplies it.

VEGEX WITH EVERYDAY FOODS —MILK

In 1920 (Journal Biological Chemistry, Vol. 41, No. 4, April, 1920) Osborne and Mendel state:

> "The inferiority of 15 cc. of the fresh unpasteurized summer milk as a source of water soluble vitamin, in contrast with 0.2 gm. of dried brewers yeast is indicated by the more rapid gains made by all the animals. "The consequences of this relative poverty of milk soluble vitamin for the artificial feeding of infants have already been referred to by us."

Vegex, the condensed whole extract from enzymatic autolyzed yeast, supplies the vitamin B factors and water soluble minerals and proteins in more readily available, palatable and easily borne form. For this reason it has been widely chosen, and its name appears so much in the literature of medical and nutritional research.



In the Newer Knowledge of Nutrition, 1923, McCollum and Simmonds say:

> "Possibly milk is lacking in both quantity and quality in substances necessary for adolescent growth and reproduction. The growth of rats on this ration and also on 5 per cent of yeast was normal."

NOT "POSED MODELS"

Five per cent of Vegex with dried whole milk does this job. The animals shown here are not "posed models" but an actual photograph of a male and female taken from a litter in the third generation fed with dried whole milk, five per cent of Vegex and water as the sole diet.

Our laboratories have not had full growth, nor reproduction with dried whole milk as the sole diet and, in all cases, there is a low red blood cell count. Chart I shows the growth curves using dried whole milk with and without Vegex, and the red blood cell counts. These curves and photographs cannot but compel attention.

CHILD CLINICAL USE

Vegex has been widely used since the first reported use by Pritchard (Physiological Feeding of Infants and Children, 1922) in work to find the relation of the vitamin B complex to the appetite and growth of children and particularly to the promotion of lactation.

It would seem that Vegex not only makes the "quart of milk a day" into a better food, but the experience is that Vegex markedly helps to get the consumption of a "quart of milk a day."

Samples for clinical or professional use will be sent on request

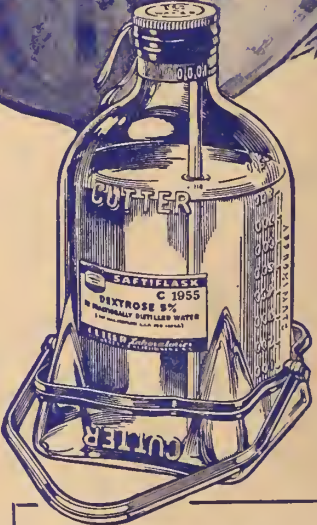
In Dextrose Solutions, Especially—
YOU NEED EVERY POSSIBLE SAFEGUARD

Mold Testing



ACCEPTED
AMERICAN MEDICAL ASSN.
Council on Pharmacy and Chemistry

The careful clinician knows that with dextrose solutions, the large volume injected multiplies the hazard of slight contamination or pyrogen content. Hence he appreciates that while such solutions are *not* government-licensed, they should be tested as exactingly as biologicals which *are* government-licensed.

Dextrose solutions *in Saftiflasks* are given rigid chemical, biological, and physiological tests. Tested by technicians wholly divorced from "production"—in a laboratory equipped for the production and meticulous testing of *biologicals.*

By prescribing solutions *in Saftiflasks* you avail yourself of the skill and experience of this government-licensed biological laboratory—one of the oldest biological laboratories in America.

Yet these ready-prepared solutions are no more costly to patient or hospital than solutions prepared in the hospital. To avoid the reaction "bugbear," use solutions *in Saftiflasks.* In two, one and half-liter sizes. Cutter Laboratories, Berkeley, California and 111 N. Canal Street, Chicago. (U. S. Government License No. 8)

DEXTROSE SOLUTIONS IN

Saftiflasks

SIMPLE!

Only one part required! —A connecting tube which is supplied with each case of Saftiflasks . . . Patented soft rubber stopper fits any connection tube . . . Connection tube becomes integral part of your injection outfit. No loose parts to wash, sterilize, and reassemble. No involved technique, with resultant multiple sterility hazards.

Communications for the Cancer Commission should be addressed to the Secretary, Otto H. Pflueger, M. D., Room 2004, 450 Sutter Street, San Francisco.

(Roster lists of officers of scientific section, component county societies, Woman's Auxiliary, A. M. A. delegates, special committees, etc., are continued on advertising pages 4 and 6.)

Decholin
REG. U.S. PAT. OFF.

In Chronic Cholecystitis

A True Choleretic
●
A Single Chemical Entity
●
Virtually Nontoxic

Through its intense choleretic influence, Decholin— c. p. dehydrocholic (triketocholanic) acid—steps up bile secretion by the liver cells as much as 200%. This intensified flow clears the biliary passages, lessens gallbladder tension, reduces absorption of toxic metabolites, improves gallbladder function, hastens recovery. To initiate choleresis more quickly, many physicians begin therapy with intravenous Decholin sodium (3 c.c. of the 20% solution), continuing therapy with Decholin 3¾ gr. tablets, one or two t. i. d. Physicians are invited to send for the second edition of the comprehensive brochure "Biliary Tract Disturbances."

ACCEPTED AMERICAN MEDICAL ASSN. Council on Pharmacy and Chemistry

Riedel-de Haen, Inc.
105 Hudson Street New York, N. Y.

Certification of Coal Tar Colors.—Secretary Henry A. Wallace recently announced that a hearing would be held February 6, 1939, on proposed regulations for the certification of coal-tar colors under the Federal Food, Drug, and Cosmetic Act. This newly enacted statute, which becomes effective June 25, 1939, prohibits the use of coal-tar colors in foods, drugs, and cosmetics unless the colors have been certified by the Department of Agriculture as harmless and suitable for use.

Listed in the proposed regulations are 132 coal-tar colors on which interested persons may submit testimony concerning harmlessness and suitability for use. Those who are unable to attend the hearing in person are invited to submit their testimony in affidavit form. The announcement points out, however, that the Secretary in the consideration of affidavits will be required to take into account the lack of opportunity for cross examination.

The list of 132 colors proposed includes the fifteen colors which have been certified for food use under the old Food and Drugs Act of 1906. The striking increase in the number of colors proposed is made necessary to meet the needs of drug and cosmetic manufacturers who have heretofore not required certified colors for use in their products.

The list of colors announced is not as comprehensive as manufacturers have requested. It has been impossible in the time available to make adequate investigations of the several hundred proposed. As investigations now under way are completed it is expected that additional colors will be proposed for listing.

A number of colors investigated were not included in the list because toxicological studies indicated that they are not harmless or because suitable methods of chemical analysis were not available. No color can be listed unless it can be analyzed for purity, Food and Drug officials explained.

The proposed regulations have been designed to offer consumers the greatest protection possible, within the authority of the statute, against harmful or unsuitable coal-tar colors. It is not proposed to certify any color for use in eyelash or eyebrow dyes.

ISOPHRIN
TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is ¼% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel's.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

ROSTER OF COUNTY MEDICAL SOCIETIES, CALIFORNIA MEDICAL ASSOCIATION

(County society secretaries are requested to promptly notify "California and Western Medicine" when changes are indicated in their roster information.)

Alameda County Medical Association
2404 Broadway, Oakland

President, Frank H. Bowles, 1624 Franklin Street, Oakland.

Secretary, Gertrude Moore, 2404 Broadway, Oakland.

Meeting, *Third Monday, 8:15 p. m., Hunter Hall, Oakland.*

Butte County Medical Society

President, E. L. Meyers, Fourth Street and Broadway, Chico.

Secretary, J. O. Chiapella, 131 Broadway, Chico.

Meeting, *Second Thursday.*

Contra Costa County Medical Society

President, Kaho Daily, 314 Tenth Street, Richmond.

Secretary, Clifford E. Dieterich, 1306 Pomona Avenue, Crockett.

Meeting, *Second Tuesday, 8 p. m.*

Fresno County Medical Society

President, Roland W. Dahlgren, 1006 Mattei Building, Fresno.

Secretary, Lester R. Nielson, 1006 Mattei Bldg., Fresno.

Meeting, *First Tuesday, University-Sequoia Club, Fresno.*

Humboldt County Medical Society

President, Samuel P. Burre, 507 F Street, Eureka.

Secretary, Joseph S. Woolford, 350 E Street, Eureka.

Meeting, *First Thursday.*

Imperial County Medical Society

President, Henry B. Graeser, 115 E. Fifth Street, Holtville.

Secretary, William A. Clarke, Holtville.

Meeting, *Third Tuesday, 7 p. m., Barbara Worth Hotel, El Centro.*

Kern County Medical Society

President, C. I. Mead, Haberfelde Building, Bakersfield.

Secretary, C. S. Compton, 428 C Street, Bakersfield.

Meeting, *Third Thursday, 8:00 p. m.*

Kings County Medical Society

President, P. K. Edmunds, Corcoran.

Secretary, William A. Johnstone, Hanford.

Meeting, *Second Monday, 8 p. m., Legion Hall, Hanford.*

Lassen-Plumas-Modoc County Medical Society

President, C. I. Burnett, Susanville.

Secretary, Fred J. Davis, Jr., Westwood.

Meeting, *On Call.*

Los Angeles County Medical Association
1925 Wilshire Boulevard, Los Angeles

President, William H. Daniel, 1930 Wilshire Boulevard, Los Angeles.

Secretary, George D. Maner, 1925 Wilshire Boulevard, Los Angeles.

Meetings, *First and Third Thursdays, 1925 Wilshire Boulevard, Los Angeles.*

Marin County Medical Society

President, Harry N. Hensler, Home Market Building, San Anselmo.

Secretary, Carl W. Clark, 510 B Street, San Rafael.

Meeting, *Fourth Thursday, 7:00 p. m., Marin Golf and Country Club.*

Mendocino-Lake County Medical Society

President, Robert B. Smalley, Willits.

Secretary, Dallas Wagner, Fort Bragg.

Meeting, *On Call.*

Merced County Medical Society

President, E. M. Soderstrom, Merced.

Secretary, Fred O. Lien, Shaffer Building, Merced.

Meeting, *Third Thursday, Hotel Tioga, Merced.*

Monterey County Medical Society

President, Walter P. Farr, 308 Main Street, Salinas.

Secretary, Herbert Archibald, Salinas National Bank Building, Salinas.

Meeting, *First Thursday.*

Napa County Medical Society

President, Alexander H. McLeish, Veterans Home Hospital, Yountville.

Secretary, M. M. Booth, Bruck Building, St. Helena.

Meeting, *First Wednesday.*

Orange County Medical Society

President, M. W. Hollingsworth, 1806 No. Main Street, Santa Ana.

Secretary, Glenn Curtis, 323 So. Pomona Street, Brea.

Meeting, *First Tuesday, 8 p. m., Chapel of the Orange County Hospital, Orange.*

Placer County Medical Society

President, William M. Miller, Auburn.

Secretary, Robert A. Peers, Colfax.

Meeting, *At Call of President.*

Riverside County Medical Society

President, N. K. Bear, 3655 Fourteenth Street, Riverside.

Secretary, Thomas A. Card, 3616 Main Street, Riverside.

Meeting, *Second Monday, 8 p. m., Library, Riverside Community Hospital.*

Sacramento Society for Medical Improvement

President, Manuel Azevedo, 1027 Tenth Street, Sacramento.

Secretary, Glenn E. Millar, 321 Physicians Building, Sacramento.

Meeting, *Third Tuesday, 8:30 p. m., Auditorium, Sacramento.*

San Benito County Medical Society

President, J. M. O'Donnell, Hollister.

Secretary, L. E. Smith, Hollister.

Meeting, *At Call of President.*

San Bernardino County Medical Society

President, Delbert B. Williams, 1151 D Street, San Bernardino.

Secretary, A. E. Varden, Medico-Dental Building, San Bernardino.

Meeting, *First Tuesday, 8 p. m., San Bernardino County Charity Hospital.*

San Diego County Medical Society
Fourteenth Floor, Medico-Dental Building, 233 A Street, San Diego

President, Hall G. Holder, 1109 Medico-Dental Building, San Diego.

Secretary, C. V. Bernardini, 1220 First National Bank Building, San Diego.

Meeting, *Second Tuesday, El Cortez Hotel.*

San Francisco County Medical Society
2180 Washington Street, San Francisco

President, Edwin L. Bruck, 384 Post Street, San Francisco.

Secretary, Stanley H. Mentzer, 2180 Washington Street, San Francisco.

Meetings, *Every Tuesday, 8:15 p. m., 2180 Washington Street, San Francisco.*

San Joaquin County Medical Society

President, N. P. Johnson, Medico-Dental Building, Stockton.

Secretary, George H. Rohrbacher, Medico-Dental Building, Stockton.

Meeting, *First Thursday, 8:15 p. m., Medico-Dental Club Rooms, Stockton.*

San Luis Obispo County Medical Society

President, J. B. V. Butler, 722 Marsh Street, San Luis Obispo.

Secretary, E. M. Bingham, County Health Department, San Luis Obispo.

Meeting, *Third Saturday, 6:30 p. m., Gold Dragon Cafe, San Luis Obispo.*

San Mateo County Medical Society

President, N. D. Morrison, 205 Third Avenue, San Mateo.

Secretary, J. Garwood Bridgman, 205 Third Avenue, San Mateo.

Meeting, *Fourth Wednesday, Benjamin Franklin Hotel, San Mateo.*

Santa Barbara County Medical Society

President, W. H. Johnston, 1515 State Street, Santa Barbara.

Secretary, D. H. McNamara, 317 W. Pueblo Street, Santa Barbara.

Meeting, *Second Monday, Cottage Hospital.*

Santa Clara County Medical Society

President, Cletus S. Sullivan, Bank of America Building, San Jose.

Secretary, Leslie B. Magoon, 652 East Santa Clara Street, San Jose.

Meeting, *Third Wednesday, 8 p. m., Medico-Dental Building, San Jose.*

Santa Cruz County Medical Society

President, John T. Harrington, 10 Cooper Street, Santa Cruz.

Secretary, Samuel B. Randall, 84 Walnut Avenue, Santa Cruz.

Meeting, *First Monday, 7:30 p. m., Club Rio del Mar, Aptos.*

Shasta County Medical Society

President, B. F. Saylor, Redding.

Secretary, Morton J. Murphy, 1542 Market Street, Redding.

Meeting, *Second Monday.*

Siskiyou County Medical Society

President, J. B. McGuire, Mt. Shasta.

Secretary, Victor W. Hart, 113 No. Oregon Street, Yreka.

Meeting, *Sunday on call.*

Solano County Medical Society

President, Ream S. Leachman, 727 Sonoma Street, Vallejo.

Secretary, John W. Green, Box 539, Vallejo.

Meeting, *Second Tuesday, 8 p. m., Casa de Vallejo Hotel, Vallejo.*

Sonoma County Medical Society

President, D. C. Oakleaf, 301A West Street, Healdsburg.

Secretary, T. E. Albers, 600 B Street, Santa Rosa.

Meeting, *Second Thursday.*

Stanislaus County Medical Society

President, John A. Cooper, 1024 J Street, Modesto.

Secretary, Hoyt R. Gant, 403 Beaty Building, Modesto.

Meeting, *Second Friday, 7:30 p. m., Hotel Hughson.*

Tehama County Medical Society

President, O. T. Wood, Red Bluff.

Secretary, R. G. Frey, Red Bluff.

Meeting, *At Call of President.*

Tulare County Medical Society

President, Newton Miller, 231 No. Main Street, Porterville.

Secretary, Ray Cronemiller, Exeter.

Meeting, *Sunday Evening once a month.*

Ventura County Medical Society

President, W. F. Mosher, 34 No. Ash Street, Ventura.

Secretary, A. A. Morrison, 625 Main Street, Santa Paula.

Meeting, *Second Tuesday, Ventura County Country Club.*

Yolo-Colusa-Glenn County Medical Society

President, H. G. Potter, Winters.

Secretary, W. J. Blevins, Jr., Woodland.

Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society

President, P. E. Thunen, I. O. O. F. Building, Marysville.

Secretary, Leon M. Swift, I. O. O. F. Building, Marysville.

Meeting, *First Tuesday.*

Public Attitudes Toward Automobile Driving*—Problem: To sample the opinions, practices, and attitudes of the driving and nondriving public with regard to automobile driving and the problem of traffic safety.

Method: Personal interviews were made by advanced students in applied psychology at the University of Southern California. Each interview was conducted in a private home or apartment according to a pretested and standardized procedure.

A total of 450 interviews were conducted in the Los Angeles metropolitan area. Of these, 267 were with holders of operator's licenses, and the remaining 183 with persons not holding operator's licenses.

The sample was selected to give a true cross-section of the total population and was controlled for age, sex, and economic status, 68 per cent of our group had driver's licenses, a figure which checks closely with the estimate of 70 per cent given me by the Department of Motor Vehicles. This close check indicates that a true cross-section was obtained.

The methods used were those developed by the members of the Psychological Corporation of New York during the past five or six years and have been made known to the public through the Fortune Surveys, the Gallup Polls of Opion, and others.

Results:

Question 1: Does the law state that if a driver hits a pedestrian crossing the street against the signal the driver is always blameless?

(Asked of 267 licensed drivers) Yes, 26 per cent; No, 58 per cent; don't know, 16 per cent. Comment: It is quite clear that more than a fourth of our drivers must be taught that there is no such thing as "open season" on pedestrians.

Question 2: Do you sometimes make a left turn on the warning signal which comes before the Go signal?

(Asked of 267 licensed drivers.) Yes, 41 per cent; no, 55 per cent; don't know, 4 per cent. Comment: Do they do it because they do not know better or because they are willing to take a chance on not being caught? See the next question.

Question 3: Does traffic law in Los Angeles permit a driver to make a left turn on the warning signal which comes before the Go signal?

(Asked of 267 licensed drivers.) Yes, 12 per cent; no, 71 per cent; don't know, 17 per cent. Comment: This question makes it clear that the majority of offenders know the law, i. e., are willful offenders. The results of the two preceding questions indicate that driving practice deviates greatly from that defined by the law. This is an unsatisfactory condition which should be cleared up by changing the law or by strict enforcement of the regulation as it now stands.

Question 4: Should drivers found guilty of reckless driving have their cars plainly marked with a sticker?

(Asked of total sample of 450.) Yes, 70 per cent; no, 22 per cent; don't know, 8 per cent. Comment: Now is the time to try this suggested curb on the reckless driver, since sentiment is so clearly in favor of the plan.

Question 5: Should 10 per cent of the gas tax in California be spent for traffic-safety education and other definite safety purposes?

(Asked of total sample of 450.) Yes, 60 per cent; no, 19 per cent; don't know, 21 per cent. Comment: You can't have foolproof highways as long as you have fools on the highways and the public knows it: Let us spend some money showing people how to avoid being fools on the highway, says John Public.

The first thing to do in the presence of frequent colds is to determine whether there is any physical cause for their occurrence.—*Hygeia.*

COÖPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY — FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

Syphilis Control in American Colleges.—Syphilis control and education in American colleges is a real problem, Dr. Raymond A. Vonderlehr, Assistant Surgeon General in charge of the Division of Venereal Diseases, United States Public Health Service, recently told the annual meeting of the American Student Health Association at the Hotel New Yorker in New York City. In Doctor Vonderlehr's opinion, this problem can best be solved by a concerted coöperative effort of college physicians, students, and the states.

"In large measure," Doctor Vonderlehr said, "college authorities realize that there is necessity for fighting syphilis on every front, including the college campus. . . ."

Doctor Vonderlehr drew attention to the recently published "Study of Syphilis in American Colleges" by staff members of the Division of Venereal Diseases of the United States Public Health Service, and pointed out that on the basis of 78,388 blood tests, the largest sample yet taken among college students, the prevalence of syphilis among white college students is 19.9 per 10,000, and is not significantly different from the rate for the comparable group in the general population. The rate for Negro students, 268 per 10,000, also is comparable with that for the general Negro population of a corresponding age-group and the slightly lower rate among college women is in line with the national figures. Size of enrollment, type of institution, or geographic location has no bearing on the rate of syphilis, which is constant at approximately two per 1,000 in all cases for white students.

Doctor Vonderlehr pointed out, however, that much syphilis among college students is not found by methods at present in use. "Failure to detect the hidden manifestations of syphilis is frequent," he said. "Many infected persons do not know that they have syphilis, and therefore they do not request examination. The consequence is that testing by selective (voluntary) methods results in failure frequently to detect syphilis among college students."

While Doctor Vonderlehr reported that 40 per cent of the 515 institutions surveyed have facilities already in operation, most of these test on clinical indication, or at the request of the student. Only twenty-three schools test routinely. . . .

Discussing the question of whether the college student, until now considered to be a minor factor in the syphilis control problem, should be offered anything more than an educational program, Doctor Vonderlehr said, "It is not to be denied that there are other youth groups in our population in which the problem is more serious, or to whom the means of combating the disease are not so easily available. . . . But, in fact, there exists a direct connection between the medical problem in the schools and colleges and in other youth groups. The connecting link is the educational and demonstrative value of college programs." . . .

Considering educational aspects of the syphilis problem in the colleges, Doctor Vonderlehr held that "no one will claim that matters of sex education, of the venereal diseases, of preparation for marriage and parenthood have been more than touched upon. In too many of these subjects there exists a yawning chasm in our curricula.

"For at least one of these subjects the reasons mitigating against a frontal attack have been largely removed. We now know syphilis to be a problem in the colleges. We know we can control it by applying modern public health principles. We know that if we do, public opinion will support that action, and we must realize that colleges have a responsibility to take the lead in the field of education. Certainly, until the colleges recognize subjects such as syphilis and other venereal diseases to be valid topics of instruction, we can hope for little advance in secondary schools."

Doctor Vonderlehr recommended that "instruction in the venereal diseases should be included in the usual course on the control of communicable diseases. It should also have a proper place in any course dealing with sex education, hygiene, and public health. Syphilis may well be used to illustrate a modern community health program with emphasis upon health education."

Medical control problems were outlined by Doctor Vonderlehr. The routine blood test, he pointed out, offers the

(Continued from Preceding Page)

most practicable method of finding syphilis quickly, easily, and cheaply. Little or no addition to personnel required for complete physical examinations of entering students is required, and coöperation with state or municipal laboratories will reduce costs to a negligible figure.

Once found, syphilis can be cured. In handling these positive cases, however, the Health Service official stressed three points:

"1. Obviously, it is of extreme importance to be sure the positive report is indicative of syphilis. Competent laboratories usually run several tests on blood specimens, but even their positive reports should be verified by physical examination and a second positive blood test in patients with latent syphilis.

"2. It is very important that the physician see to it that treatment is begun and carried through. By whom the treatment is to be given is a matter for individual decision. In many cases it may be possible for the student to take treatments from his own physician or pay for such treatments himself. If he cannot, however, the school must see that treatments from some source are forthcoming.

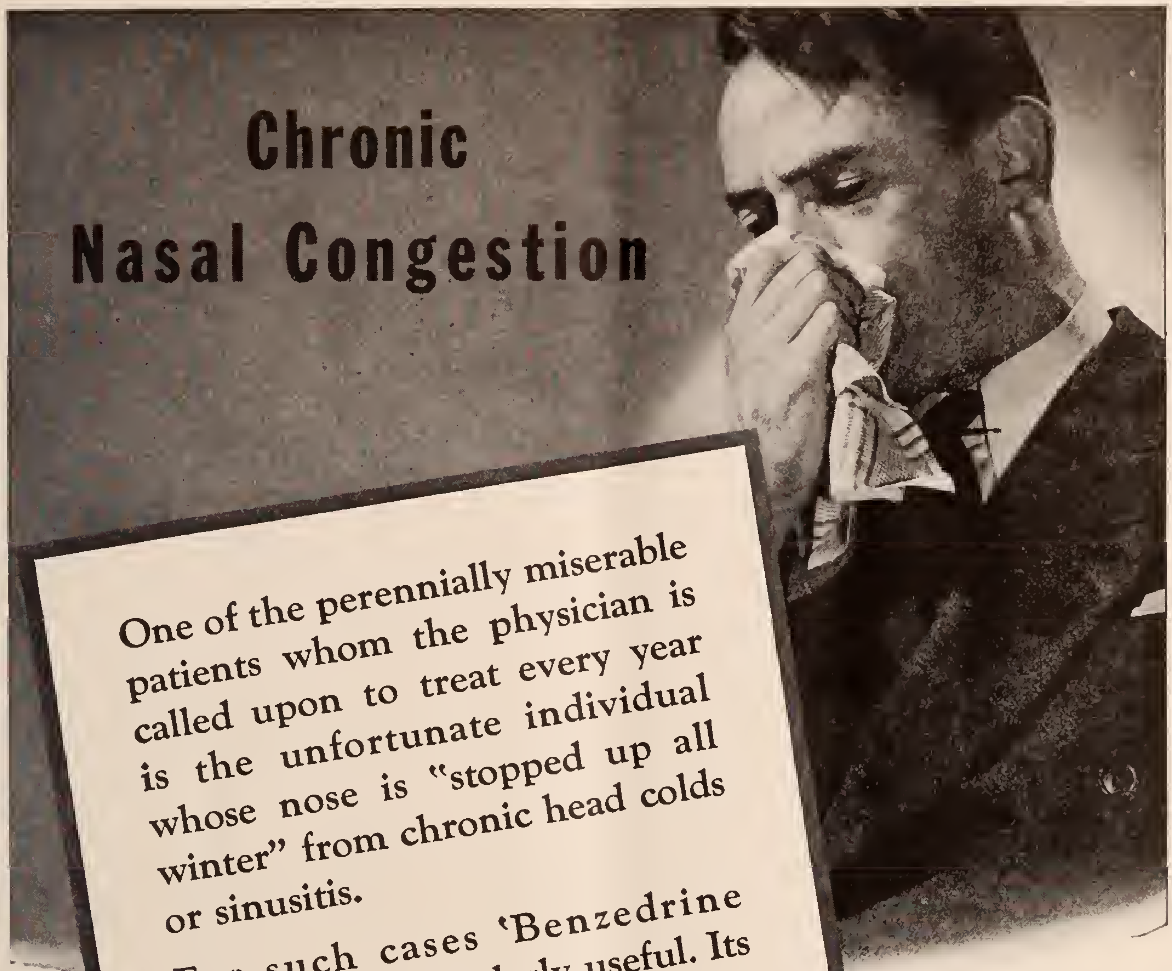
"3. Closely linked to this problem of treatment is a third point: Positive reactions must not be allowed to be the basis of expulsion or other disciplinary action unless the patient refuses to carry through adequate treatment or persists in activity conducive to the spread of the disease."

If one continues to ply one's mind, growth ensues, even in the years formerly supposed to be marked by stagnation and decay. To foster this growth one must not trust too much to the casual gains of every day work and experience. One must put forth well directed efforts. Merely to maintain one's status is not enough. He who is satisfied to stand still will soon slip backward. To grow one must go on learning. So it has come about that education, formerly thought to be an activity limited to the days of one's youth, is now seen in one form or another to be desirable in all periods of life. Thus one continues to improve; thus one keeps young.—Leon J. Richardson.

Art Tells History of American Medicine: "Beaumont and St. Martin."—"Beaumont and St. Martin" is the first of six large paintings in oil, memorializing "Pioneers of American Medicine," which artist Dean Cornwell will complete in the next few years. Others in the series are: Dr. Oliver Wendell Holmes, Dr. Ephraim McDowell, Dr. Crawford W. Long, Dr. William T. G. Morton, and Major Walter Reed, and one woman, Dorothea Lynde Dix, who, while not a physician, stimulated physicians to study insanity and feeble-mindedness.

Arrangements to supply physicians with free, full-color reproductions of "Beaumont and St. Martin" without advertising, and suitable for framing, have been made with the owners, John Wyeth & Brother, 1118 Washington Street, Philadelphia.

Sound, produced by the action of the breath on the vocal cords, is the raw material of speech.—*Hygeia.*



Chronic Nasal Congestion

One of the perennially miserable patients whom the physician is called upon to treat every year is the unfortunate individual whose nose is "stopped up all winter" from chronic head colds or sinusitis.

For such cases 'Benzedrine Inhaler' is particularly useful. Its vapor diffuses through the nasal cavity, relieves congestion and aids in establishing ventilation.

COACHING FOR STATE BOARDS — MEDICAL AND Dental. Arthur H. White, M. D., Suite 1005, Flood Building, San Francisco.

EYE, EAR, NOSE AND THROAT MAN, EXCELLENT education and preparation here and abroad, desires association with individual or group. Have license. Experienced and capable of major surgery in specialty, including bronchoscopy. At present in practice in large midwestern city. Gentile, Protestant; able to make moderate investment. Address Box 100, care of California and Western Medicine, 450 Sutter Street, San Francisco, California.

NORTHERN CALIFORNIA PRACTICE AND EQUIPMENT for sale. Here only one year but collections $5,600. Wish to take some postgraduate work. Invoice over $2,000. Fine climate and hunting and fishing. Will take $1,000. Write, Box 200, c/o California and Western Medicine, 450 Sutter Street, San Francisco, Calif.

WANTED, BY PHYSICIAN LICENSED IN CALIFORNIA— position as assistant or associate to general practitioner or institution, in out of town practice. Ten years' experience in Germany. Address Box 210, California and Western Medicine, 450 Sutter Street, San Francisco, California.

Golden Gate International Exposition: "Heart Glucosides in Medicine."—The Sandoz Chemical Works, Inc., Basle, New York, will show the results of the distinguished chemist, Prof. Dr. Arthur Stoll, and his collaborators, especially with reference to the isolation of the cardiac glucosides actually preëxisting in the fresh plant. This work made possible their individual study, and the elucidation of their relationships to previous isolated glucosides now shown to be degradation products.

These investigations cover different fields of chemical, pharmacological and medical research, and serve to illustrate the fact that chemical discoveries of theoretical interest may have important practical application in medicine. In addition, there will be shown the importance of the different classes of glucosides: the cardiac glucosides and the sugars; digitalis and squill glucosides; the strophanthins; the sapinin glucosides; the toad venoms; the glucosides of digitalis lanata; the isolation of digilanid and its separation into individual components; the graded hydrolysis of the digilanids; the genuine glucosides of digitalis purpurea and the results of the comparative pharmacological investigations of the glucosides.

There will be shown also the flowering plants of the various species of digitalis, squill, and strophanthus; chemically pure crystalline substances derived from these plants, and the finished products. These will be further illustrated by formulae, curves, and charts. During the entire duration of the exhibit, interesting films will be shown on various aspects of heart disease.

Exhibit material prepared through the resources of the California Heart Association will also be shown and it will include the significance of the heart and its diseases, diagnosis and treatment.

Exploitation of the Medical Profession.—Everywhere it is rampant—newspapers, magazines, billboards, radio. "Your doctor will tell you that. . . ." "Medical science has found that. . . ." "The greatest specialists in Timbuctoo say that. . . ." And the rest of the story is, of course, "Use our pills or our vitamins three times a day; ask your doctor."

You are forced to compete with those who offer your patients free advice regarding medical treatment. You deliver Mrs. Blank's baby today, and tomorrow she will receive by mail samples of baby foods with complete directions how to use them. Indeed, some physician representing a commercial organization and knowing that the case is in your hands may address a personal letter to your patient offering his services free.

It has been said that ten more years of the present trend of interference in medical practice will do away with the need for private practice of infant feeding and other branches of medicine.

Mead Johnson & Company have always believed that the feeding and care of babies and growing children is an individual problem that can best be controlled by the individual physician. For over twenty years and in dozens of ethical ways we have given practical effect to this creed. We hold the interest of the medical profession higher than our own, for we too, no doubt, could sell more of our products were we to advertise them directly to the public.

So long as medical men tacitly encourage the present trend, so long will serious inroads continue to be made into private medical practice. When more physicians specify Mead's Products when indicated, more babies will be fed by physicians because Mead Johnson & Company earnestly coöperate with the medical profession along strictly ethical lines and never exploit the medical profession.

Riboflavin (Vitamin B Group).—Recent experiments undertaken by the National Institute of Health of the United States Public Health Service indicate a suspected but hitherto unproved importance of riboflavin (one of the vitamin B group) in human diet.

Riboflavin is one of the vitamins which can be dissolved in water and is not destroyed by ordinary heating or cooking processes. It is considered one of the more important members of the vitamin B group although in the early days it was classified separately as vitamin G.

The vitamin riboflavin is widely distributed in nature in such foods as milk and other dairy products, meat, eggs, and green leafy vegetables. Liver and dried brewers' yeast are especially good sources of this important vitamin.

Riboflavin has an unusual history in that it was discovered quite accidentally and not during the course of feeding experiments. The first recognition of this vitamin came from chemical studies on tissue extracts and on enzymes. It was probably first recognized in 1879 as lactrochrome, or the water-soluble pigment in milk. The isolation, proof of structure, and synthesis, however, have all been done in the last eight years. The vitamin riboflavin has a structure which is probably rather difficult for the body to construct. It must, therefore, be present in our diet.

The daily human requirement of riboflavin may be estimated at one to two milligrams. It is not difficult to meet this requirement through the use of ordinary diets. Forty to eighty grams of fresh liver will supply the requirement as will one quart of milk. Vegetables also are high in riboflavin vitamin content.

One of a series of advertisements prepared and published by PARKE, DAVIS & Co. in behalf of the medical profession. This "See Your Doctor" campaign is running in the *Saturday Evening Post* and other leading magazines.

STORM WARNING FOR FEBRUARY: RISING MERCURY

THE YOUNGSTER in the picture isn't terribly sick.

He has come home from school with signs of nothing more than an ordinary cold. But his mother, sensible woman that she is, packs him off to bed at once.

For she knows that, at this time of year particularly, *any* cold may be the threshold of pneumonia. She knows that February shares with March the dubious honor of being a "pneumonia month;" that, together, they constitute the season of the year when pneumonia is most prevalent and most dangerous.

Throughout the next six or eight weeks especially, it will be wise to take every possible precaution against pneumonia. Get plenty of rest—for pneumonia's greatest ally is fatigue. Avoid any over-exposure, particularly to extreme cold and dampness.

But above all, if anyone in your family has a cold and his or her temperature rises above normal, don't delay! Call your physician at once. Watch out, too, for chills, pain in the side or chest, and a cough. They, also, are danger signals that should be heeded promptly.

If your doctor is called at once, there is less to fear from pneumonia than ever before. Medical science can offer pneumonia patients more help—can bring about more and quicker recoveries—than in any previous "pneumonia season."

But the pneumonia germ works fast, and every hour counts. If your doctor's treatment is to be most effective, he *must* be called early.

SEE YOUR DOCTOR

GENERAL
OPERATIVE SURGERY

A Continuous Course » Will Start April 6, 1939

SUBJECTS COVERED—The principal operations of general surgery will be included. The work will consist of the surgery of the stomach and gall-bladder, intestines and colon, urogenital organs, hernias, goiter, amputation of the breast, bone and tendon surgery, amputations, etc.

METHOD OF INSTRUCTION—Every part of the course will be preceded by a thorough foundation of the anatomy. This will consist of lectures, demonstrations and dissections. The principal operations will then be described by the instructors and performed by the students on fresh human material. Opportunity will be given to have demonstrations on the living.

MINOR SURGERY—Opportunity will be given to perform minor operations such as injections of varicose veins and hernia, blood transfusions, spinal and local anesthesia, injection of hemorrhoids, fissures and fistulas, repair and amputation of cervix, perineorrhaphy, hydrocele, varicocele, minor operations on nose, removal of tonsils (local and general).

CLINICAL WORK—Pelvic and rectal examinations, study of the optic disc and ear drum, paracentesis, cystoscopy.

HOURS, ETC.—The work will be done on Thursdays from 11 a.m. to 2 p.m.

The fee will be $15 per month

Applicants must be graduates of schools approved by the State Board of Medical Examiners

For descriptive circular and further information inquire of

TWENTY-FIVE YEARS AGO

(Continued from Text Page 168)

ago the secretary very thoughtfully printed in this announcement a list of laboratories and biological depots advertising in the State Journal. Will not every county society that issues a bulletin or prints an announcement, from time to time give a list of a number of different advertisers in some line of activity or another which advertise in the Journal? Will the editors of those bulletins be good enough to call attention to the fact that members may very often save money by buying what they need from our advertisers rather than by sending to some eastern house for the article? . . .

* * *

Where Does the Doctor Come In?—"To the Editor of the State Journal: Dear Sir:—At a meeting of the San Francisco County Medical Society, held January 6, 1914, the plans of the Industrial Accident Board of the State of California, were unfolded to the medical profession. . . .

"The only hope for the medical man who is not in the employ either of the state or an insurance company is lost. He is facing the problem his confrères have faced in Europe and his time for action is now. But if he applies to his county society, the one organized body to which he can appeal, what is the answer? Contract practice is not ethical.

"The time has come and the need is urgent that every medical man must join his county society and see that immediate action is taken for the protection of himself and those dependent on him."

* * *

The California Industrial Compensation Act.—The state law which went into effect January 1 [1914], and which provides for the care, treatment, and compensation of an injured employee, touches our profession immediately and in many essential ways, for, obviously, an injured person must be treated by a physician as soon as possible and thereafter attended by a doctor until he is well. Two quite interesting meetings were held—one in December in Oakland, the meeting of the Alameda County Medical Association, and the other in January at the San Francisco County Medical Society; the former was addressed by Mr. Pillsbury of the Commission, and the latter by Mr. French of the Commission, and by Dr. Morton Gibbons, who has been appointed the medical officer at the head of the insurance feature of the Act. A number of points of great interest were brought out at these meetings. . . .

* * *

Industrial Accident Law.—The New Law. The Boynton Workmen's Compensation, Insurance and Safety Act, Chapter 176 of the Laws of 1913, superseded the Roseberry law on January 1, 1914.

Compensation. The new way of computing compensation, which will be compulsory, excepting for agricultural pursuits and household domestic service, is based on the nature of the physical injury or disfigurement, the occupation of the employee and his age at the time of injury. This will give some men more money than other men, according to the schedule based on the three essentials referred to. In addition, there is provision for pensions, at a reduced rate, for those who are permanently and seriously hurt and who are unable to follow their vocations. In order to meet this extra cost, which affects very few men, the compensation payments will not begin until two weeks after disability. The Roseberry law provided for a waiting period of one week. It is believed the addition of the extra week will pay fully for the pensions of those who have been eliminated from the industrial field. . . .

From an Original Article on "A Plea for the Immediate Operation of Fractures," by Charles G. Levison, M.D., San Francisco.—That the open treatment of fractures is now an accepted procedure is no longer disputed, and it is being rapidly adopted by those surgeons who were formerly most violent in their opposition. One point of the contro-

versy as to whether fractures should be operated immediately or whether operation should be delayed, is still unsettled, and is the *raison d'être* of this paper.

Before entering upon the discussion of the operation, it must be emphasized that immediate operation should under no circumstances ever be attempted by anyone whose technique is not absolutely perfect, for the remarks that follow here are only intended for those operators whose surgical technique is above reproach. . . .

From an Original Article on "A New Treatment of Poliomyelitis," by D. H. Moulton, M. D., Chico.—We all know from our observation and from our readings what terrible afflictions the recent epidemic of poliomyelitis have wrought upon the babies and children, and even adults, of this and other countries. We see the effect of this dread disease all about us and, aside from plaster paris, braces, and operative procedure, we have been almost powerless to help the little ones and restore them to normal, so that they might take their respective places in the great caravan of life and be normal, useful men and women. . . .

From an Original Article on "Presentation of Patients." Congenital Dislocation of the Hip and Extensive Skeletal Tuberculosis. Radiogram. By Harry M. Sherman, M. D., San Francisco.—A. C., ætat. 3 years in 1897. Sent to me at that date by the late Dr. Henry Gibbons, Jr. The boy had a congenital dislocation of the right hip, with anterior location of the femoral head. A manipulative reduction was easily done, and proved to be stable. Eight months afterward, when the boy was up and about, I found a kyphos, evidence of a vertebral tuberculosis. He was put on a Bradford frame for a year, and then was gotten up in a jacket. Four months later he evidenced a tuberculosis of the left hip and went back on the frame, with traction on the hip added. . . .

From an Original Article on "The Epidemiology and Control of Rabies," by W. A. Sawyer, M. D., Director of the Hygienic Laboratory of the California State Board of Health.—Rabies is a serious and expensive disease which can easily be prevented by the communities involved. A knowledge of its epidemiology is the only reasonable basis for determining the necessary preventive measures. . . .

These three characteristics of rabies—the long incubation period, the short period of infectivity terminated by death, and the transmission by bites only—permit a rough prediction of the course of an epidemic and the formation of a reasonable plan for the control of the outbreak. A more accurate prediction, however, can be based on the study of previous epidemics as a whole. . . .

A few cases of the disease were reported in Southern California before the earliest dates shown by the laboratory records. The curve representing Southern California begins in September, 1909, and shows a sharp rise in November, representing chiefly cases in Pasadena. The next two peaks in the curve coincide with the prevalence of the disease in Los Angeles in 1910. The peak in January, 1911, was caused principally by cases in Riverside. Since then the disease in Southern California has apparently become endemic, with a decreased number of cases in animals and man. The moderate increase in February and March of 1912 occurred in Los Angeles.

The second curve represents the San Joaquin and Sacramento valleys. The first case shown occurred in December of 1909 in Stockton and represents a circumscribed outbreak which showed little tendency to spread. In January, 1911, cases were discovered in the southern end of the San Joaquin Valley. Apparently, the sparsely settled mountainous region between the San Joaquin Valley and Southern California had greatly retarded the extension of the disease northward in spite of the railroad traffic through this region. The disease spread rapidly through the thickly populated farming country on the east side of the valley. The summit of the curve in January, 1912, represents the height of the disease in Fresno, Kings, and Tulare counties.

NEO-SYNEPHRIN Hydrochloride EMULSION

allows a vasoconstricting film to be spread rapidly and uniformly over the nasal mucosa.

The low surface tension of Neo-Synephrin Hydrochloride Emulsion assures prompt distribution of this efficient vasoconstrictor, with resulting shrinkage of congested tissues.

Neo-Synephrin Hydrochloride relieves symptoms of nasal stuffiness quickly, yet rarely produces undesirable side reactions. Hence, it is a therapeutic agent of low toxicity and high efficiency for symptomatic relief of nasal congestion due to colds and sinusitis.

NEO-SYNEPHRIN Hydrochloride

(laevo-alpha-hydroxy-beta-methyl-amino-3-hydroxy ethylbenzene hydrochloride)

Three dosage forms for intranasal use:

SOLUTION	EMULSION	JELLY
¼% and 1% (1-oz. bottles)	¼% (1-oz. bottles)	½% (in collapsible tubes with nasal applicator)

Oxygen Service

Dependable and Speedy
Available Night or Day

Stuart service is geared to give you utmost speed—day or night or holidays. A telephone call to any of our four plants will speedily bring the most approved type of tent or catheter, oxygen to use in it, and a trained man to attend to installation.

As the largest independent producer of oxygen in California, you can depend on us for thorough, fast service in giving your patient the benefits of oxygen therapy *in time.*

Furthermore, you can depend on us to take the *lead* in lowering your patient's costs.

Our rental charges for tents now are lower than ever—they have been reduced $2.50 a day.

Manufacturers of a complete line of Medical Gases

TWENTY-FIVE YEARS AGO

(Continued from Page 16)

The increase in cases from August, 1912, to March, 1913, was in part due to cases in recently involved communities in the northern end of the San Joaquin Valley, but largely to the passage of the epidemic northward into the Sacramento Valley, involving many towns and the city of Sacramento. Now that the disease had invaded the most populous portions of both valleys, it began to decrease. This curve, representing many communities, is much more gradual in its changes than the curves representing single cities.

In October, 1911, the first case was discovered in San Francisco. In February of the following year the epidemic developed suddenly, and in April it reached its maximum. This is an excellent example of the rapid spread of a disease in a region previously uninvolved. The fall was almost equally rapid and was, undoubtedly, greatly influenced by the measures instituted by the city against the disease. A recrudescence occurred a year later. Since then the number of cases has been small compared with those in neighboring communities.

San Francisco is surrounded by cities and towns, and there is a great deal of travel between them. On all sides but one the traveling is done by ferry, and the egress of dogs in these directions is, therefore, less than if there were no water barrier. The fourth curve shows how the disease spread up the peninsula over the land boundary from San Francisco into San Mateo and Santa Clara counties: There was nothing to prevent dogs from traveling in this direction in considerable numbers, causing repeated invasions of the disease and a correspondingly early and sudden epidemic. The peak of the curve was reached in May, 1912, and was due to the involvement of South San Francisco, San Mateo, Palo Alto and the intervening country. The subsequent rises in the curve represent increases of the disease in the same region. . . .

From the Los Angeles County Medical Association, Annual Report for the Fiscal Year Ending December 18, 1913.—To the Members of the Los Angeles County Medical Association:

Your Secretary-Treasurer begs leave to submit the following report for the forty-third year of the Association, ending December 18, 1913:

Part I. Report of the Treasurer.—Financial report.

The financial report of the Association for the period, December 19, 1912 to December 18, 1913 (with the cancelled check stubs, receipted bills and ledgers, for the inspection of the Auditing Committee), is as follows:

A. Maintenance Income of 1913

Total first half-year dues	$3,672.00
Total second half-year dues	3,636.00
Special assessments	1,779.00
Miscellaneous	11.00
Total all income, 1913	$9,098.00
Carried over from 1912	156.61
Grand total all income during 1913	$9,254.61

B. Maintenance Expenses of 1913

1. Paid assessments to State Society	$2,508.00
2. Envelopes and postage	331.16

Petrolagar Plain

AN ADJUNCT TO THE RESTRICTED DIET

During a period of restricted diet, bowel regularity may be maintained with the aid of Petrolagar Plain. As an adjunct to the diet, Petrolagar induces a soft, well-formed stool and encourages a regular habit time for bowel movement.

If the case is severe, Petrolagar Plain may be given in alternate doses with Petrolagar with Cascara until proper elimination is established. Then Petrolagar Plain alone will assist in maintaining a regular, comfortable movement.

Petrolagar is issued in five types to suit the individual case.

Petrolagar—Liquid petrolatum 65 cc. emulsified with 0.4 Gm. agar in a menstruum to make 100 cc.

Petrolagar

Petrolagar Laboratories Inc. • 8134 McCormick Boulevard • Chicago, Illinois

WHAT!—ONLY 2 OZ. OF NUCOA ALONE SUPPLY ABOUT 15% OF A CHILD'S DAILY VITAMIN A REQUIREMENTS???
ABSOLUTELY! AS YOU KNOW, CHILDREN REQUIRE 6,000—8,000 UNITS A DAY AND SINCE EVERY POUND OF NUCOA CARRIES AT LEAST 7,500 U.S.P. UNITS OF VITAMIN A, 2 OZ. OF NUCOA SUPPLY ABOUT 1,000 UNITS—OR ABOUT 15% OF DAILY VITAMIN A REQUIREMENTS¹
IN ADDITION, NUCOA PROVIDES APPROXIMATELY 3,300 CALORIES PER POUND... AND EXPERIMENTS ON PEOPLE SHOW IT TO BE ABOUT 96% DIGESTIBLE²
WELL— IT CERTAINLY LOOKS LIKE NUCOA HAS MOVED TO THE FRONT IN THE FOOD FIELD
IT HAS! NUCOA IS A VERY NUTRITIOUS FOOD AND IN MY OPINION IT'S EXCELLENT FOR ACTIVE CHILDREN. I NEVER HESITATE TO RECOMMEND NUCOA TO MY PATIENTS
THESE FACTS ABOUT NUCOA ARE VERY INTERESTING. I'M GOING TO GET A POUND AND HAVE MY WIFE TRY IT!

Part II. Report of the Secretary.—General report of the state of the Association.

The year 1913 may be said to show a continuation of the progress which has marked the career of our society in recent years.

1. *Membership.* The total number of members for whom we paid assessments to the California State Society was 622. The figures show that the Los Angeles Society has doubled its membership in the last eight years. Our society continues in 1913 as the largest county medical unit in the State of California. . . .

10. *Our County Medical Association Telephone Exchange.* Quite the largest proposition that our society inaugurated during the last year is our County Medical Exchange and the work which it hopes to accomplish, and which, we believe, it will most splendidly carry out, have already been explained in some detail in the bulletins of the Society. It is not necessary, therefore, to go over this subject again. . . .

We make our usual apology to any whose feelings we may have hurt. If any such instances have occurred, it was against our wish and desire. Your secretary-treasurer, therefore, thanks you all for your kind coöperation and willingness to aid him in his duties. Respectfully submitted,

(Signed): George H. Kress,
Secretary-Treasurer.

San Francisco County Medical Society: From Presidential Address, by H. B. A. Kugeler, M. D.

Fellow Members of the San Francisco County Medical Society:

I desire to thank the Board of Directors for the honor of electing me their presiding officer and president of the Society.

For eighteen years I have taken an active interest in the affairs of this society, but even that did not bring to my personal knowledge the peculiar complaints of members and nonmembers as to what the Society should do and what it should not do. I desire to emphasize the fact that the most peculiar complaints came from those who were members and who never attended meetings. I have tried in every way possible to impress on the members that the only way that errors in the Society can be corrected is through the active participation of those members in the meetings and proceedings of the Society. To those members of the profession outside of the Society, I have taken every possible occasion to bring home the fact that they could not dream of correcting errors in the Society unless they were members, and by their participation in the discussions and meetings correct any deficiencies that they felt the profession of San Francisco was suffering from. . . .

* * *

Report of Secretary.—As secretary I beg leave to submit the following report for 1913, that is, from December 10, 1912 to December 8, 1913, inclusive.

Membership

The total number of members for whom we have paid assessments to the State Society is 589 as compared with 556 of last year, an increase of thirty-three members for

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

Information and circulars upon request

Address: CLIFFORD W. MACK, M. D.

the year (thirty-four were really admitted, of whom one came by transfer from Los Angeles, where his assessment was paid). Of this number there are:

Paid up with us		558
Dropped for nonpayment	5	
Died	2	
Transferred	1	
Delinquent	23	31
		589

It may be of interest, as a matter of record, to note the following:

In 1907 the membership was	498
1908	482
1909	482
1910	476
1911	548
1912	556
1913	589

It will thus be seen that, while so-called membership campaigns have not been productive of much good in the past, a steady, persistent effort on the part of this office has led to a gradual increase in our number. There is still considerable work, however, to be done along these lines and, hoping that this may be an incentive to our members to get busy, we wish to state that the membership of the Los Angeles County Society exceeds ours by a considerable number. We should not rest until every eligible physician and surgeon within the county has joined our society. Surely, a little persuasion on the part of a man's confrères should suffice to show him the benefits of membership. . . .

(This is the first time that the San Francisco County Medical Society's books have been so kept as to show the actual financial status were the Society to go out of business December 31. The showing, when one considers the large sums expended for library and the sums expended by the Building Committee and the Committee on Legislation,

TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

is a most creditable one and cannot be compared with that of last year, when no account was taken of outstanding bills, especially those of the library.) . . .

Respectfully submitted,
(Signed): RENÉ BINE.

From Report of the Milk Commission of the San Francisco County Medical Society.

Mr. President and Members of the Society:

The Milk Commission of the San Francisco County Medical Society has held fourteen meetings this year.

Two new dairies have been certified. . . .

The value of certified milk in infant feeding has again this year been proved on the foundling babies of the city. A death rate of 3.2 per cent is theirs against 9 plus for the city. These babies are uniformly fed on modified certified milk, and are all under two years of age. Two hundred and forty were cared for this past year. The Commission regards itself as peculiarly fortunate in having this practical demonstration of the advantage of clean milk as a basis for infant feeding, for the vital statistics of so large a group cannot be refuted.

In closing, your Commission wishes to urge your coöperation in its efforts to promote the understanding and appreciation of its work for public health in securing and upholding certified milk for our San Francisco market.

Respectfully submitted,
ADELAIDE BROWN, *President.*

From Alameda County Society Report.—The annual meeting of the Alameda County Medical Association was held at the Hotel Oakland on Tuesday evening, December 16, 1913. The meeting was called to order by the president, Dr. M. L. Emerson, at 8:30.

The minutes of the previous meeting were read and approved.

The members then listened to a very interesting address by Mr. A. J. Pillsbury of the California State Industrial Accident Board on the subject of the "Employees' Compensation, Insurance and Safety Act." Dr. Philip Mills Jones, Secretary of the State Medical Society, was present and also made a few remarks on the subject, calling particular attention to the efforts of insurance companies to make a schedule of fees for physicians called to attend cases under this Act which will be altogether too low.

Dr. Dudley Smith made a motion, seconded by Doctor Reinle, that the president appoint a committee of three to confer with the State Industrial Accident Board in regard to the schedule of fees to be paid physicians attending cases under this Act and to report to this Association before any definite action is taken in the matter. Carried. The president stated that he would leave the appointment of this

committee to the new president. The new president, Dr. Dudley Smith, later made the following appointments on this committee: Dr. G. G. Reinle (chairman), Dr. L. P. Adams, and Dr. Alvin Powell. . . .

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 168)

initiative measure. The plan, which would put the state's hospitals and medical men under control of a commission of nine members, was presented by Avery C. Moore of Berkeley, formerly associated with the Townsend pension plan.

Highlights of the proposed constitutional amendment:

Facilities of all hospitals now supported in whole or in part by the state would be made available immediately without cost.

Private hospitals would provide the same facilities, but would be compensated for their use.

All physicians, surgeons, osteopaths, chiropractors, and registered nurses would be under the regulation of the commission.

They would be under two classifications—full-time employees of the state with salaries ranging from $2,5000 to $7,500 a year, and those not employed by the state but who would be required to take any case assigned them by the commission, at a set fee.

The proposal did not provide for funds, but specified that they should be included by the Governor in the budget after a year's trial had determined how much money would be needed to carry it out. . . . Mr. Webb will be asked to prepare a title for the measure, which will appear on the state ballot if sufficient signatures are obtained." (San Francisco *News*, December 28, 1938.)

"Arrested by officers today, Jackson L. Martin of Fresno immediately went before Judge M. K. Gibbs and pleaded guilty to a charge of practicing medicine without a license.

BOARD OF MEDICAL EXAMINERS

(Continued from Preceding Page)

He was released under $250 bail until next Tuesday, when he is to appear for sentence. T. P. Hunter, agent for the Board of Medical Examiners, said Martin admitted his license to practice medicine had been revoked in 1928 for performing an illegal operation. Hunter said he went to Martin's office this morning and discussed plans for an illegal operation with the former physician." (San Francisco *Chronicle*, January 1, 1939.) On January 3, 1939, the sentence of 180 days' probation, conditions of which were that he pay a fine of $100 and abstain from further violations of the law, was imposed by Judge Gibbs.

"On the recommendation of the state medical board, two charges of violation of the business and professions code and one of violation of the chiropractor's code were dismissed today against 'Dr.' St. Louis Estes, Los Angeles raw-food advocate. . . ." (United Press Dispatch, dated Oakland, December 28, 1938, and printed in the San Bernardino *Sun*, December 29, 1938.) (Previous entries, November, 1930; January, 1936; December, 1938.)

"Through an inadvertent error, the *Tribune* mistakenly said Thursday that prosecution of St. Louis Estes, health food advocate, was dropped because he agreed to leave California. There was no such agreement; in fact, Estes plans to remain in the Bay region, his attorney, Alexander Mooslin, said yesterday. Mooslin explained that the prosecution of Estes, under the Business and Professional Code of the State (and) Chiropractic Act, was dropped in San Francisco and later in Oakland, because Mooslin informed authorities that Estes would cease using the prefix 'Dr.' with his name. The attorney said that Estes now will advertise as a 'Ph. D., formerly practicing dental surgery, osteopathy, chiropractic, and naturopathic.' He has practiced these in other states but never in California, the attorney said." (Oakland *Tribune*, January 1, 1939.)

"An echo of a case which attracted wide attention here about a year ago was heard today in Superior Court, as Deputy District Attorney William Mahedy presented an order asking for destruction of medical instruments confiscated from Mrs. Laura Miner prior to her trial on abortion charges. Mrs. Miner figured in a coast-wide abortion ring investigation and aided the prosecution in Los Angeles to convict several persons involved. In her trial here, she was acquitted by a jury in Superior Judge Arthur Mundo's court. Mahedy stated that Mrs. Miner gave the district attorney here an affidavit permitting destruction of the instruments. The prosecutor was to ask Mundo to sign the order and then, if the signature is obtained, to instruct Investigator Tom Frost to proceed with the breaking up of the instruments, said to have cost considerable money." (San Diego *Tribune*, December 29, 1938.) (Prior entries, July, September, October, December, 1936; August and November, 1937.)

"Application of the Los Angeles College of Chiropractic for allocation of sixty beds at the Los Angeles County Hospital for patients desiring chiropractic treatments today was referred by the Board of Supervisors to the hospital Advisory Committee and to the Los Angeles County Medical Advisory Board. The college stated that one hundred or more chiropractors would donate services in giving free treatment." (Press dispatch dated Los Angeles, December 24, and published in the Pasadena *Star-News*, same date.)

"Lester R. Daniels, Sacramento, was reappointed to the State Board of Osteopathic Examiners for the term ending December 21, 1941." (Pasadena *Star-News*, December 23, 1938.)

"A man who said he was Romano Nicholas Trotsky, 41-year-old nephew of Leon Trotsky, exiled Soviet leader, appeared in a Los Angeles federal court today and denied

"It has been estimated by Tisdall that more than half the foods in the ordinary American diet have no appreciable content of vitamin B_1."*

*Story of Vitamin B_1, Tisdall, JAMA (1935) 105-1583

Here's why

Ralston, the hot wheat cereal, is the easy economical answer to the problem of vitamin B_1 deficiency

Ralston is a delicious hot cereal made from premium whole wheat with coarsest bran removed. Then it is enriched with 2 times the amount of wheat germ found in whole wheat. Wheat germ, as every doctor knows, is the richest natural source of vitamin B_1.

Wheat Germ Contains

6 or 7 times as much vitamin B_1 as eggs or ordinary whole cereal.

16 times as much vitamin B_1 as spinach.

40 times as much vitamin B_1 as milk.

Ralston costs only 25¢ for a 24-ounce package. Supplies approximately 45 International Units of vitamin B_1 in each ordinary serving. It is available at grocery stores everywhere.

2 times richer in vitamin B_1 than natural whole wheat.

RALSTON Wheat Cereal

RALSTON PURINA COMPANY, Dept. CW, 3816 Checkerboard Square, St. Louis, Mo.

Please send me a copy of your Research Laboratory Report, and samples of Ralston, the Wheat Cereal which is "double-rich" in vitamin B_1.

BOARD OF MEDICAL EXAMINERS

(Continued from Page 24)

charges he made false statements in applying for American citizenship." (San Francisco *Call-Bulletin,* December 27, 1938.) (Previous entries, April, 1937; May, 1938; Board's annual report, 1937.)

"For years explorers have trodden British Guiana's dank forests with dread of the hollow pop of a blowgun, the whirr of a tiny arrow, and sudden death. The Macusi Indians of the country have the unpleasant habit of tipping their wasp-like missiles with snakes' needle-like fangs, then making matters worse by dipping the fangs in a potion of squashed ants and deadly curare, juice of a species of plant. Last week the curare part of the potion made news in San Francisco, not by getting under the skin of hardy explorers but because it had been penetrating the epidermis of chronic drunks. The California Board of Medical Examiners hailed a nonmedical man named Thomas F. H. Huston, his assistant, and two nurses into court on charges of practicing medicine without a license. While doctors sometimes use small amounts of curare in tetanus cases, the Board contended that Huston had no right to give it to the drunks taking his 'cure'—it contended he had no right to give them drugs of any type, for that matter. More than three years ago Huston, a former embalmer, had set up operations legally; he was licensed by the state to run a private sanatorium—called the Samaritan Treatment Institution—for alcoholics who needed a rest. But, so the charges declare, he did more than give his cases rest; he offered three Samaritan treatments, consisting of injections of drug mixtures known as No. 1, No. 2, and No. 3 (No. 2 was the curare-containing formula and was reserved for the most incorrigible drunkards). These shots, bringing on nausea, were employed in treatments costing about $150 and lasting two or three days, with the understanding that the patient was to come back for more if he was not cured. Whether it was the South American poison or just the treatment in general, many Samaritan-

Cosmetics and Your Patient's Morale

THE DOCTOR IS OF NECESSITY A STUDENT OF LIFE Each new patient presents a new study, a new problem. Psychology plays an important role in the course of treatment he prescribes With some patients he must be frank to a point of harshness, with others he must be gentle and coaxing. The nature of the illness and, more particularly, the nature of the patient determine his attitude He knows from experience the value of bolstering his patient's morale. As a student of psychology he knows that few things are more depressing to a woman than the fear that she is losing her charm, that when she no longer cares how she looks the chances are she has lost touch with a vital interest in life. And because he appreciates the importance of a sensible interest in personal appearance he quite rightly encourages his patients to look their best at all times. FINE COSMETICS appeal to that interest That is why they deserve to be recommended by doctors who are, after all, greatly concerned with their patient's morale.

treated alcoholics didn't like it. They started kicking to the State Board of Medical Examiners, and when complaints had accumulated the Board issued formal charges against the Huston group. . . . The case is expected to be tried next month." (*News Week*, December 12, 1938.) (Previous entry, January, 1939.)

"C. C. Chappelle, 66-year-old former San Jose physician whose license was revoked several months ago by the state medical board, was granted straight probation by Superior Judge William F. James today on a charge of performing an illegal operation. Probationary term was set at three years with the condition that Chappelle refrain from engaging in his profession for the rest of his life. . . . 'I am not sentencing you to jail because of your physical condition and also because I feel that you have already suffered as much as a man could suffer by losing your license to practice your profession,' Judge James told Chappelle. . . . (Probation Officer) Watson's report said that the district attorney's office have had numerous complaints of his asserted illegal medical practice here, but that this was the first time a complaint had been formally sworn in court. . . ." (San Jose *News*, December 9, 1938.)

"Preliminary hearing on charges of transportation and possession of narcotics will be held next week for Dr. Lee E. Smith, fifty-eight, of 1445 Sixty-eighth Avenue, and Dorothy Wakefield, alias Grace Moore, forty-two, nurse of 3241 Mountain Boulevard, State Division of Narcotic Enforcement, officers said. The couple were arrested by Agents Fred Stemm and L. E. Rice on November 17 on Mountain Boulevard, in the Wakefield woman's car. She is charged with transportation, he with possession. Morphin valued at $400 was seized, Stemm said. Both pleaded not guilty. Meanwhile, the State Attorney-General's office moved to seize the woman's automobile through civil proceedings." (Oakland *Tribune*, December 11, 1938.) (Previous entries, December, 1932; April, May, December, 1936.)

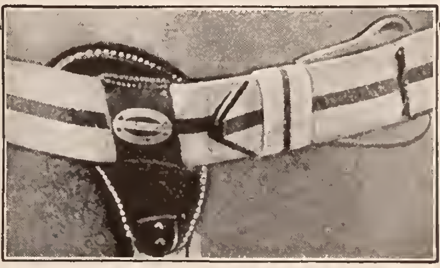
INJECTION TRUSS
DEVELOPED THROUGH
CLINICAL RESEARCH



1 Quickly applied, easily adjusted.
2 Treatment can be given without removal of truss.
3 Comfortable and non-irritating.
4 Constant retention day and night.
5 Correct anti-impulse retention in any body position.
6 Helps reduce number of injections required.
7 Covers both internal and external ring and collapses canal.

BOARD OF MEDICAL EXAMINERS

(Continued from Preceding Page)

"Dr. J. H. McMurtry, Clovis physician, was arrested late yesterday by an agent of the State Board of Medical Examiners on a charge of practicing medicine without a license. He was released on the posting of $500 cash bail. J. W. Williams, representing the State Board, said Doctor McMurtry continued his practice despite the revocation of his license in October, when the Board found him guilty of performing five abortions. Doctor McMurtry said today he had applied for a writ of review in the superior court, and had continued his practice on the advice of his attorney, who informed him the appeal would automatically stay the Board's order revoking his license." (Fresno *Bee and Republican,* December 9, 1938.) (Previous entry, December, 1938.)

"Where professional services are donated by a physician to county hospital in care of a patient later discovered to be a nonindigent, the physician should be entitled to require the patient to pay, according to an opinion given out today by the District Attorney. The District Attorney's inquiry indicated it has been the custom for physicians to request payment of such patients, but the county has taken no part except to collect for itself, the opinion stated. The study was made when Los Angeles County Hospital authorities inquired concerning the San Diego County method of handling such problems." (San Diego *Tribune,* November 30, 1938.)

"Charging a conspiracy to injure him in his profession as a metaphysician and doctor of psychology, Adolph Oosterveen filed suit in the Superior Court today against Ecquiel C. Montijo, Manuela Lopez and others for $52,000 damages. The defendants falsely accused Oosterveen of practicing medicine without a license and caused his arrest on that charge, but he was tried and acquitted in court, according to the complaint." (Los Angeles *Herald and Express,* December 7, 1938.)

"The last decision to be handed down by the late Superior Judge J. J. Trabucco, who died this morning, was the denial of a new trial to a physician and a former policeman, who had sued a widow for $9,875. The decision, mailed on Saturday from Dante Hospital, where he was ill, was received by the clerk of Superior Judge George J. Steiger's court this afternoon. The suit, filed by Dr. Nathan S. Housman and John C. Farrell against the widow of Lewis M. Baker, involved expenditures alleged to have been incurred during Baker's fatal illness." (San Francisco *Call-Bulletin,* December 13, 1938.) (Previous entries, November, December, 1932; July, 1933; January, 1937.)

"A criminal complaint, accusing Dr. T. Maude Ramer of performing an illegal operation was issued by the district attorney's office today. Doctor Ramer, sister of Dr. Blanche Ramer, found guilty of a similar charge last summer, is alleged to have performed the operation December 10 upon Mrs. Edith Monteith, thirty, of 1470 Second Avenue. Mrs. Monteith was in Mercy Hospital today in a serious condition as the result of the operation, the state contends. Investigators sought Doctor Ramer with a warrant." (San Diego *Sun,* December 17, 1938.)

"The Pacific Health Corporation, a San Francisco group health association, yesterday appealed to the United States Supreme Court from a State Supreme Court decision that it practiced without a license. By selecting physicians to administer to its members the health organization actually was practicing medicine in violation of the state's Medical Practice Act, the State Court held. In asking the high tribunal to void the decision, the corporation, according to Associated Press dispatches from Washington, D. C., did not question the validity of the California law in so far as it prohibited any unqualified or unlicensed physician from practicing medicine. The appeal was the second development in two days in the fight over group health. Tuesday the Department of Justice obtained indictments against the American Medical Association, three affiliated societies, and

twenty-one physicians on a charge of violating the anti-trust laws." (San Francisco *Chronicle*, December 22, 1938.)

"Dr. John A. Kelleher, 333 Monterey Boulevard, was arrested by State Narcotic Bureau agents last night on three charges of furnishing narcotics. The agents, accompanied by Police Officer Edward Oliva, took Kelleher into custody at his 10 Twenty-ninth Street offices." (San Francisco *Chronicle*, December 20, 1938.)

"A thief in search of narcotics was believed to have stolen an automobile belonging to Dr. C. B. Alexander, Alhambra physician, from a parking lot late Wednesday. The car was recovered by Radio Officers Buhman and Dixon in an alley south of Main near Almansor Street a few hours later. A medicine bag had been removed from the car." (Alhambra *Post-Advocate*, December 22, 1938.)

"Deputies of the sheriff's station at San Dimas today sought to locate the physician whose professional bag was found last night on Cienga Avenue in the Charter Oak district. The bag, empty, apparently had been thrown from an automobile, deputies said. It was a black, Boston-style bag, bearing the initials 'Dr. C. B. A.,' stamped on the side. The bag will be held at San Dimas station for a few days for possible identification, and then if unclaimed will be turned over to the sheriff's property department in Los Angeles." (Pomona *Progress-Bulletin*, December 22, 1938.)

"Comedian W. C. Fields, charged $12,000 for a month's medical treatment, doesn't have to pay because the amount 'shocks the conscience,' the State Appellate Court had ruled today in San Bernardino. The court reversed a $12,000 judgment granted by Superior Judge O. K. Morton of Riverside to Dr. Jesse Citron, who treated Fields when he was ill with pneumonia in 1936. Judge Morton erred, the Appellate Court said, when he refused to hear cross-examination as to the Hemet, California, physician's earnings and his usual charges in such cases. . . .· Doctor Citron had testified at the trial that Fields' illness was complicated by his habit of drinking 'from a quart to two quarts of whiskey daily,' and that his treatment sharply reduced the patient's appetite for liquor." (Los Angeles *Herald and Express*, December 21, 1938.)

"The Department of Professional and Vocational Standards as it is now set up in the state government appears to be one of the chief worries of the Democratic Administration, which will assume control in January. . . . Of particular interest to the Administration is the huge reserve fund which has been built up through the years from fees charged for licenses and examinations. That money has an untouchable status now, because it is collected for the sole purpose of maintaining the department and the particular bureau which collects it, and the surplus cannot be turned back into the general fund to be used for general governmental purposes. . . . A quiet investigation has already been started by H. Dewey Anderson, relief director, . . . to see if something cannot be done to consolidate many of the bureaus in the department. . . . Anderson would like to work out some amendment to the law which would permit the excess funds to be turned over to the general fund at the end of the year in order to meet the mounting cost of relief. Such a move would immediately arouse the antagonism of the professional and vocational groups affected, and it is doubtful that such legislation could be forced through either house of the legislature. . . ." (Oakland *Tribune*, December 22, 1938.)

"Two 'treasure hunt' asserted dope peddlers, who buried narcotics under bushes in Golden Gate Park, were arrested by federal narcotics agents here today. At the same time the agents nabbed a local chiropodist and booked him on charges of possessing more than two hundred tablets of morphin. The arrested men gave their names as Hugh Johnson and William Murphy and Dr. William A. Roberts.

When Steers Had Long Horns

THE medicinal value of the glands of internal secretion was not recognized.

But times have changed, as well as cattle. Now, the therapeutic value of certain gland products is definitely established and each year adds to our knowledge in this important field of therapeutics.

To the physician prescribing gland products we urge specification of "Wilson," because it connotes a product made at the source of supply from fresh glands, processed promptly, with the aim of conserving maximum hormone activity, in a laboratory devoted exclusively to the endocrine field.

BOARD OF MEDICAL EXAMINERS

(Continued from Page 29)

Johnson and Murphy resorted to a new trick, according to Major Joseph A. Manning, in charge of the federal agents, by hiding out morphin cubes in 'caches' in the park. When they made a sale, Major Manning said, they drove their customer to the park in an automobile, removing enough morphine from their open-air 'safes' to meet the customer's need. They were charged with possession, sale and transportation of morphin, and their automobile and a quantity of narcotics confiscated. In the other case, Doctor Roberts, who cannot have narcotics lawfully in his possession, according to Major Manning, was found with a large quantity of morphin in his office. He was charged merely with possession." (San Francisco *Call-Bulletin*, January 9, 1939.)

"Mrs. Zahda I. Duysen, 915 West Fourth Street, was found guilty on charges of violation of the State Medical Practice Act after a court trial yesterday by Municipal Judge Wilber F. Downs. . . . Several men and women testified that they bought courses of treatment from the defendant. The treatments, according to the testimony, consisted of several different kinds of medicine, including mineral liquids, snake oil, capsules, and tablets. . . . Attorney O. R. Young, counsel for Mrs. Duysen, contended that his client was not guilty of violating the medical practice law, as she was merely a peddler with a license from the State Board of Pharmacy as an itinerant drug peddler." (Long Beach *Sun*, January 6, 1939.)

If men gave three times as much attention as they now do to ventilation, ablution, and exercise in the open air, and only one-third as much to eating, luxury, and late hours, the number of doctors, dentists and apothecaries, and the amount of neuralgia, dyspepsia, gout, fever, and consumption, would be changed in a corresponding ratio.—J. F. Clerk.

Immediate Action Under New Food and Drug Act.—Action to enforce several sections of the new Food, Drug and Cosmetic Act were begun instantly, says the annual report of the Food and Drug Administration, although the new bill became law only five days before the close of the fiscal year which this report covers. The first enforcement of the new legislation dealt with dangerous cosmetics, in particular with poisonous eyelash dyes, reports W. G. Campbell, Chief.

Other provisions which went into effect immediately when President Roosevelt signed the act on June 25, 1938, dealt with dangerous drugs and with new and untried drugs. These two sections were an outgrowth of two of the more spectacular services by the Administration within the year covered by this report. These were the "Elixir of Sulfanilamide" catastrophe and the "cancer serum" episode.

A special report required by Congress covered the main points in the sulfanilamide tragedy, and the present report is limited to facts not available when the Secretary's report was submitted. The Administration emphasizes that the disastrous results came from the use of an untested and highly poisonous solvent, diethylene glycol, and not from the drug, sulfanilamide itself, which is recognized as a valuable curative agent when administered under competent medical advice. Diethylene glycol and several other glycol solvents have been used in certain flavoring extracts, against the advice of the Administration. The "elixir" disaster demonstrated clearly the dangerous possibilities of these solvents. In consequence inspectors seized many lots of extracts and flavors as well as of the solvents, and the distributors promptly recalled outstanding stocks so that the market was soon cleared of this menace.

As an indication of the thorough manner in which the Food and Drug Administration mobilized in the "Elixir" campaign, Mr. Campbell reports that a final check up accounted for 99.2 per cent of all the elixir that has been prepared. The "cancer serum" search was complicated by a mistake by the attending physician in reporting the source of the serum which was contaminated by tetanus toxin. Chiefly as the result of the "cancer serum" and "elixir"

(Continued on Page 34)

Painstaking laboratory investigation and thorough clinical study are the heritage of each Lilly Product. Such a background leaves but one obligation to be fulfilled. Carefully planned marketing must place control of the drug in the hands of the physician. ¶ Lilly Products are distributed only through ethical channels.

CALIFORNIA PHYSICIANS' SERVICE: A STATE-WIDE MEDICAL SERVICE BY THE CALIFORNIA MEDICAL PROFESSION

Action Taken by the California Medical Association House of Delegates.—Since December 17–18, 1938, when the House of Delegates of the California Medical Association met, responding to a call by the California Medical Association Council at its meeting of November 12, the citizenry of California and, in fact, of the United States, have been aware, through the press association dispatches, that a new form of medical service, on a state-wide plan, was about to be tried out in California. The text of the call for the special session of the Association's supreme legislative body—the House of Delegates—and the reasons for convening the delegates were given in the editorial and other departments of the December and January issues of CALIFORNIA AND WESTERN MEDICINE. The following comments, therefore, will deal more with subsequent events, such as the enabling resolutions of the Council, subsequently acted upon by the House of Delegates, which may be found on page 40 of the January issue of the OFFICIAL JOURNAL.

* * *

Steps in Further Organization.—In accordance with the instructions given by the House of Delegates on December 18, the Council, on Saturday, January 14, 1939, took steps to bring about the incorporation of the new organization—a nonprofit corporation, separate and distinct from the California Medical Association—and to indicate who among the members of the California Medical Association were to have the responsibility of serving as the first "administrative members" and the first "board of trustees."

The new organization, itself a corporation, naturally must have a governing body or board of directors; and this group is named the Board of Trustees. The trustees, in turn, must be elected by persons who possess voting qualifications as outlined in the Association's by-laws. These voters, who may or may not be doctors of medicine, are called administrative members, and the number of such is not to exceed seventy-five. Some of the initial administrative members will give up their positions later to physicians who will be elected as regional representatives (two from a district) in a set-up that contemplates about fifteen such districts, into which California will be divided.

[†] Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

* * *

Incorporation Plans.—When the House of Delegates met in Los Angeles on December 17, its members were given copies of the tentative drafts of the medical and hospitalization service plan as prepared by the Special Committee, and approved by the Council. The House, in turn, through its own Reference Committees, again as Committee of the Whole, and acting also as the House, considered and passed upon the plans proposed and submitted, and also gave instructions to the Council to proceed with the organization of the new nonprofit corporation. Some delay, as might be expected, is always encountered when an application for incorporation, needing signatures of incorporators residing in different parts of the State, is prepared for submittal to the State authorities. However, once the incorporation is completed, its Board of Trustees can begin to function officially, and further development of the plan should then proceed in an active manner. It is not possible to state definitely the period of time necessary to accomplish these ends, especially for an enterprise of such wide scope, for which, while it is important that no time be wasted, it is likewise equally desirable that no undue haste, likely to contribute to error, be evidenced.

* * *

Members of the First Board of Trustees.—The group of seven physicians who have been named for places on the first board of trustees of this California Physicians' Service include the following: Drs. Ray Lyman Wilbur, Stanford University; Lowell S. Goin, Los Angeles; T. Henshaw Kelly, San Francisco; C. Kelly Canelo, San Jose; W. Earl Mitchell, Berkeley; Samuel Ayres, Los Angeles; Alson R. Kilgore, San Francisco.

For additional information concerning these and other organization steps, readers are referred to the California Medical Association department in this issue, on page 132.

* * *

Some Basic Purposes.—It is well for all California physicians to keep in mind that the proposed medical-service plan is designed to operate on a nonprofit basis, and that it is to be a voluntary organization, both as regards the doctors of medicine, namely, the "professional members," who register to give service, and as pertains to citizens of certain income brackets who, through periodic payments, choose to avail themselves of the professional services so offered—this latter group to be known as "beneficiary members." The plan, it is equally well to observe, does not contemplate any essential interference with medical practice as it now exists. On the contrary, special efforts are and will continue to be made to maintain the standards of medical practice and of scientific medicine, as they now obtain, and to promote their continued and legitimate development.

Not an Insurance Plan.—The California Physicians' Service is not an insurance or similar health plan. Rather, it is a method which aims to make it possible for citizens of certain income classes, through periodic payments, to secure for themselves the professional services of physicians of their own choosing, exactly as they make such choice today, through payments rendered to the California Physicians' Service instead of to the doctors of medicine who gave the services. The California Physicians' Service, in turn, will then pay the physicians on what is called the unit basis.

The schedule of charges—or so-called fee table—to be used as the basis for payments will probably be one that is in accord with the averages in vogue for services rendered in California, and certainly not lower; and the payments to the physicians who have rendered service in a particular month will be on the "unit basis." Thus, to illustrate, if a certain service is rated as being entitled for remuneration, say, to the amount of five dollars, and the unit selected should be one dollar per unit, then the physician who had rendered and submitted a statement for five dollars would be credited as eligible for repayment on the basis of five units. Whether the unit would measure up to 100 per cent (one hundred cents on the dollar) would depend upon the amount of money remaining in the fund after administrative and hospitalization services had been covered.

* * *

Information Brochure in Preparation.—The foregoing statements are made in the OFFICIAL JOURNAL to acquaint the members of the California Medical Association, in a general way, with some of the basic provisions in the "California Physicians' Service." The Council, however, has instructed its Special Committee to prepare a brochure that will give more explicit information on many details in which all doctors of medicine in California have a very natural interest. The pamphlet so prepared will be placed in the mails as promptly as possible, and a copy will be sent to every Doctor of Medicine licensed in California. In the meantime, it is well to remember that the California Physicians' Service is an organization that has been brought into being through action, carefully considered, by the House of Delegates, the representative body of elected delegates in whom is vested the supreme authority to act for the members of the Association. That action having been taken, the responsibility for carrying the plan through to satisfactory end-results will be vested jointly in the officers of the new corporation and the members of the California Medical Association. With careful thinking and wholehearted coöperation, the plan should soon be put into successful operation.

DEL MONTE ANNUAL SESSION

This Year's Programs Have Exceptional Lure.—In all years, the advice to attend the annual session of the California Medical Association may be properly given; but this year the suggestion comes with special force to members of the

Association. Not only for the valuable scientific and other programs, but because of the widespread interest in the Medical Service plans, soon to be put into operation in California, this coming gathering should have particular appeal. At a recent meeting of the Committee on Scientific Work, the reports of the secretaries of the twelve scientific sections indicated more than ever that the time necessary for attendance may be put to most profitable use.

Several joint sessions will be held with symposia on topics such as sulfanilamid, chronic alcoholism, and poliomyelitis. The guest speakers include: Dr. Chester Keefer, Harvard University; Dr. Stuart Harrington, Mayo Clinics; and Dr. U. V. Portmann, Cleveland Clinics.

The clinical pathological conference, to be conducted by Dr. Chester Keefer, in coöperation with California colleagues, will undoubtedly measure up to the excellent standard of previous years.

The first general meeting on Monday morning, May 1, will be given over to the addresses of President W. W. Roblee of Riverside and other speakers, who will present, among other things, progress reports on the Association's plans for a statewide, voluntary medical service.

The programs of the scientific sections, the scientific exhibits and the technical-commercial booths, as outlined in the tentative plans, should all be of interest and value.

In the scientific exhibit section, it is proposed to present an almost continuous series of films on medical and surgical work.

* * *

Hotel Reservations Should Be Made.—Del Monte and the Monterey Peninsula are outstanding in possessing surroundings of never failing attraction to all who love the great out-of-doors or an environment of historical interest. Members who do not journey to Del Monte by automobile may use with equal convenience railroad transportation. A one and one-third round-trip rate will be secured for those who present travel certificate forms from county society secretaries, and, in due time, these will be forwarded. In the California Medical Association department* in this issue is given a list of the hotels, with rates, location, and other information. All members who contemplate attendance at the annual session, May 1-4, should promptly write for reservations. Why not lay plans now to attend the 1939 annual session?

PRESIDENT-ELECT CHARLES A. DUKES' VISITATIONS TO COUNTY SOCIETIES IN SOUTHERN CALIFORNIA

Visitation Itineraries of President Roblee and President-Elect Dukes.—Commencing on Monday, January 16 and ending on Wednesday, January 25, President-Elect Charles A. Dukes of Oakland, with the Association Secretary and District Councilors C. L. Emmons, Carl A. Howson and Louis A. Packard visited the following societies: Orange, Pasadena, Riverside, Los Angeles, San Diego, Imperial, Ventura, Santa Barbara and San Luis Obispo. At each meeting there was a full attendance. In Los Angeles the large auditorium was filled, with overflow attendance in the dining rooms, where loudspeakers had been installed.

In November last, President W. W. Roblee covered most of the northern and central counties in California. Since, in recent years, it has become evident that the demands upon the time of the presiding officers of the State Association for visitation work are so great, a plan has been devised whereby, annually, the President-Elect will take for visitation the county societies in one portion of the State, and the President, in the succeeding year will visit the county units in the other part of California.

* * *

Medical Service the Major Topic.—In President Roblee's tour in November the subject for discussion was "The Good of the Association," with emphasis on national and state trends in medical service. President-Elect Dukes, however, was called upon to speak on the plans for a special service recently formulated in California, and now being put into operation. At each meeting a full presentation of the plans was made, ending always with the request that questions be asked. The large attendance at the meetings and the numerous queries submitted are indications of the deep interest taken by members in the proposed "California Physicians' Service."

The California Medical Association is greatly indebted, therefore, to President W. W. Roblee and President-Elect Dukes for their more than generous donations of valuable time, and for the efficient services they have rendered to organized medicine in California in cordially meeting the members of the local societies and frankly and ably discussing with them some of the major problems now confronting the medical profession. Truly, officers of medical associations, in our present day, hold positions that no longer belong merely to the honorary class. An official position in a medical society, today, means work, and plenty of it!

POSTGRADUATE CLINICAL CONFERENCES

Clinical Conferences with Teams to Be Held in Northern, Central and Southern California. Component county medical societies will shortly be contacted concerning the holding of clinical conferences within their districts. The State Committee on Postgraduate Activities hopes to secure the coöperation everywhere of county society units for a series of spring and fall clinical conferences, designed respectively to carry the work to Northern, Central and Southern California. In each section it is planned to send out one or two teams, for several days at a time, each team covering a territory conveniently located. For this potential work the aid of faculty and nonfaculty teachers and demonstrators has been promised. Shortly, full information concerning these graduate conferences will be forwarded to each county society, with a request for coöperation from their angles.

---

* See page 137.

In several states, postgraduate activities have been put into operation on a statewide basis and with excellent, even astonishing results; and California should not be laggard in this important work. Officers and program committees of local societies are urged to arrange their meeting schedules so that the holding of clinical conferences in their districts may be promoted. Already, during the last several years, the San Joaquin County Medical Society, under the leadership of Dr. C. A. Broaddus, and his coworkers, has demonstrated the value of consistent postgraduate work, and last year the medical societies of Santa Barbara, Kern and Ventura counties held a two-day, Saturday-Sunday graduate session that met with excellent attendance and hearty approval. May not the example set by these societies be well followed by other county units?

PRESIDENT ROOSEVELT'S HEALTH PROGRAM

Presidential Message of January 23, 1939. As this February issue of California and Western Medicine goes to press, dispatches from Washington indicate that Congress will be urged by President Franklin D. Roosevelt to enact part of the health program put forward by the Technical Group appointed by President Roosevelt's Interdepartmental Committee; the report of the two committees having been presented at the National Health Conference which convened in Washington on July 17, 1939.

Recommendations of the Health Conference have already been commented upon in previous issues of the Official Journal. It may be recalled that in a five to ten year health-development program, as outlined by the lay technical experts, it was proposed to spend as much as eight hundred and fifty million dollars during the peak year of the effort! It is reassuring, therefore, to note that the present Congress will be called upon to appropriate no more than fifty million dollars for a beginning of the work, and this along lines of health conservation with which the American Medical Association and its constituent state organizations are in full accord.

As given in the preliminary newspaper reports, the present program should meet with the joint approval of citizens and members of the medical profession. (In this issue, see also pages 139-140.)

* * *

A Provision of Particular Interest.—Worthy of special mention is the inclusion of a provision mentioned in the statement:

"1. Pay physicians to care for those too poor to afford medical care."

This official recognition of the obligations of the public in the care of the indigent sick has been too long delayed, so far as it relates to official governmental announcements, and its promulgation at this time, therefore, is all the more welcome.

The Text of the Washington Announcement. For members of the California Medical Association who may have missed reading the item referred to, the first Associated Press dispatch on the subject is printed below:

> PRESIDENT ROOSEVELT URGES HEALTH PLANS TODAY
>
> *Special Message to Congress May Ask Eight Hundred and Fifty Millions Yearly for Big, Long-Range Program*
>
> Washington, January 22 (AP).—President Roosevelt is expected to urge Congress, in a special message tomorrow, to enact legislation for a huge, long-range health-improvement program.
>
> The health program, which would provide for expenditures of up to eight hundred and fifty million dollars annually from state and federal funds by 1949, has been a controversial issue since it was recommended to Roosevelt last July by his special Interdepartmental Committee on Health and Welfare.
>
> Wagner Has Bill
>
> Senator Wagner (Democrat), New York, has prepared a bill calling for a fifty-million-dollar appropriation to begin the proposed health program.
>
> While the proposal stirred up some opposition in medical circles, the American Medical Association agreed last September with the Interdepartmental Committee that there was a vital need for an extension of existing medical facilities.
>
> Dr. Irvin Abell of Louisville, Kentucky, President of the Association, conferred last week with President Roosevelt and said afterward that the Association was in full agreement with the Chief Executive on the need for the use of Government funds in promoting the health of the nation.
>
> Money Program
>
> *Money appropriated for the health program would, according to recommendations of the committee, be used to:*
>
> *1. Pay physicians to care for those too poor to afford medical care.*
>
> *2. Assist existing hospitals and build new ones where needed, particularly in rural areas.*
>
> *3. Establish clinics for quick diagnosis and treatment of disease.*
>
> *4. Encourage vaccination against preventable diseases.*
>
> *5. Develop maternal and child welfare facilities, including baby clinics, schools for expectant mothers, visiting nurses, and obstetrical care if needed.*
>
> *6. Stimulate public health service to control disease through such activities as controlling stream pollution, establishing more efficient quarantines, health instruction for both children and adults, and closer inspection of milk and water supplies.*
>
> *Funds would be allotted to states and communities under restrictions requiring that they do their part in health promotion.*

SCIENTIFIC MEDICINE AND WARS

Address of Dr. Edward M. Pallette.—At the Del Monte annual session of two years ago, the retiring president, Dr. Edward M. Pallette of Los Angeles, gave to his presidential address the title, "Human Betterment." In his discussion of organic evolution he called attention to the manner in which the advances in scientific medicine had in one sense created an imbalance, through making possible the accretion to our population of many individuals who in former centuries, under the rule of the survival of the fittest, would not have lived to adult life.

Several of Doctor Pallette's statements, to which exceptions were taken, are as follows:

> We are fast approaching a condition when we will be a nation of adolescents, governed by adolescents, for adoles-

cents. Or, if you will, a nation of subnormals, governed by subnormals, for subnormals. . . .

And morons all have large families of physically healthy little morons—always morons. . . .

* * *

Views of Major General William C. Rivers, U. S. A.—Along the line of Doctor Pallette's thought, but from a different angle and on a different subject, we find in an International News dispatch from New York, dated January 22, the following interesting item:

> MEDICINE AID TO WAR TOLD
>
> Medical science is responsible for the great wars of modern times because it provides warring nations with the necessary human "cannon fodder" by curing or preventing diseases which years ago wiped out whole armies.
>
> That charge was made tonight by Major General William C. Rivers, one of the most distinguished officers in the United States Army, now retired. He spoke with several other prominent Army and Navy officers at a forum, entitled "Has Science Made War More Terrible?" presented by the American Institute.
>
> Disease Conquered
>
> "If you had attempted thirty years ago or so to mobilize the fifty million men put into the field by only five nations of Europe for the World War, some twenty million of them would have died of disease in the training areas.
>
> "The remaining thirty million would have gone into the war itself weakened by diseases of the training camps—diseases like typhoid fever, which modern medicine now can control and prevent."

The above are given space because there is much room for thought on the points brought out, especially to doctors of medicine, who have had biologic training.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 132.

EDITORIAL COMMENT†

MICROBIC METAZOA

A revolutionary change is taking place in bacteriological theory as a result of the rapidly increasing evidence that certain bacterial colonies show specializations within the cell population, and integrations by means of a primordeal nervous or circulatory system. The initial observation suggesting this futuristic theory was the isolation by Muto [1] of a nonpathogenic microörganism from his own saliva that was capable of forming motile colonies on agar plates. Since these colonies crawl about in a manner suggesting the movement of snails or slugs, he named his buccal bacillus "Bacillus helixoides." About a year ago two similar microorganisms were isolated from the intestinal contents of worms by Smith and Clark [2] of the Bureau of Plant Industry, Washington, D. C. The American species were named "Bacillus alve" and "Bacillus circulans."

Cinematographic studies of B. helixoides (or B. alve) colonies are currently reported by Shinn [3] of the Western Pennsylvania Hospital, Pittsburgh, Pennsylvania. Moist agar plates were seeded with this microörganism and placed in a photographic apparatus, fifteen automatic exposures per hour being made over a period of two days. A study of the resultant films showed that there are at least four stages in the development of individual colonies. Maximum colony motility was noted in the initial stage of development, before the colonies had grown to more than 0.5 millimeter in diameter. Under low magnification the small colonies often shot across the field of view with bullet-like precision. The path was rarely linear for a considerable distance, but usually consisted of a series of wide circulating loops. The calculated average speed was about 14 millimeters per hour.

As soon as the growing colonies reached 0.5 millimeter in diameter, an abrupt stop of all forward movement was usually noted, the beginning of the second or dormant stage. Growth continued during this rest period. As soon as the dormant colonies reached about 1.0 millimeter in diameter, motility was resumed. Linear movements were never observed in these awakened colonies, motility taking the form of rapidly accelerating rotations of the cell mass. In 99 per cent of the 250 rotating colonies studied in the Pittsburgh laboratory, the direction of rotation was counterclockwise. The maximum speed of rotation was inversely proportional to the diameter of the colony, and averaged about 1.4 r. p. h. for the 250 colonies studied. "As the rate (of rotation) increases, spiral arms are extended from many colonies, so that they resemble spiral nebulae. Fragments are frequently detached to lead an independent existence, and may depart entirely or continue to circle the parent as a satellite. Some colonies will detach a complete ring of growth which continues to rotate about the center at some distance from it." As the colonies approach two millimeters in diameter, the rate of rotation gradually decreases, the colony eventually "freezing" into terminal senility.

Assuming that linear and rotary motions of these colonies are due to cilia, Doctor Shinn concludes that "it would be necessary to postulate some mechanism by means of which the individualists of the cell population are induced to submit to regimentation." In other words, there must be the physiological equivalent of a nervous system or of a circulatory system within the colony. Marked morphological differences have been noted [1] between the surface bacteria and those near the colony center. Both structural differentiation and neurohormonal regimentation, therefore, are thus suggested. This regimentation is of theoretical interest, since it conceivably duplicates the earliest stage in the evolution of our present metazoa.

THE PHRASE, "ART AND SCIENCE OF MEDICINE"

Recent interest in semantics, or a study of the meaning of words, suggests a consideration of that well-known phrase, "the art and science of medicine." In the light of what Castiglioni[1] calls "a more and more manifest unrest" with "new tendencies of studies, research and clinical speculation," two different meanings can be ascribed to the phrase. If these are not kept in mind, misunderstandings may develop.

In one sense the terminology, "art and science," is applied to characterize the difference between practicing and research medicine. As a man of research, the clinician is considered to be a scientist; as a practitioner, an artist. As a research clinician his task is considered to consist of "accumulating data"; as a practicing clinician it is considered to consist of "judging" to what extent the accumulated "facts" (i. e., generalizations) can be used for a special purpose, for determining, for instance, whether or not digitalis should be administered in a particular case. The term "art," as used in this sense, is applied synonymously with the terms "skilfulness" and "craftsmanship." The difference between medicine as art and medicine as science, as seen from this viewpoint, is primarily a quantitative difference of precision, a difference of perfection of one single method, namely, of the method of measuring as applied in two different fields. For, however different the two goals of practicing and research medicine may be, it is only the lack of development of the method of measuring in practicing medicine, the insufficient analysis of the individual, which makes the practice of medicine from this point of view an art.

In the second sense, the term "art and science of medicine" is not used to indicate a quantitative difference, but to point out the possibility and necessity of looking from two qualitatively different angles at patients, regardless of whether in the field of practicing or research medicine. In this use of the phrase, the term "scientific" connotes the aim to judge by measuring, regardless of the encountered difficulties, while the term "art" is used to indicate an attitude of the clinician toward nature and patient, which is quite similar to that of an artist toward nature and his creation.

In art, as understood by artists themselves, the quality of the achieved result cannot be measured. It cannot be determined by comparing it against some norm or transforming it into such neutral entities as quantities and figures. Only nonmathematical conceptions, such as consistency, can reveal the artistic quality of a product of art. The quality can only be determined by comparing the achieved result in itself, with its "idea." Likewise, as understood in this most specific sense of the term "art," the healthy state of the single individual patient, as encountered in practicing medicine, can only be determined by comparing the single individual with himself, with his "idea"; for (again as understood from the artistic point of view of this second differentiation) the single individual is in-dividual; it cannot be divided and transformed into quantities and figures. And the single individual is single in the sense of unique; it has no standard with which it can be compared. In other words, the single individual is, from this point of view, not accessible to the scientific method; not judgment, but intuition characterizes the term "art," as contemplated in this second sense of the phrase. Grote, in order to describe precisely from this standpoint the state of "individual" health, coined the term "responsivity" ("Responsivitaet"), *i. e.*, corresponding with oneself. As said above, the artistic and scientific viewpoint supplement each other in this differentiation; only their common use comprehends the individual completely.[2]

It is in relation to research medicine, however, and not in relation to the single individual, to practicing medicine, that Henle, in his "Handbuch der rationellen Pathologie," refers to the artistic side of medicine, and that Virchow, in the first volume of his "Archiv," distinguishes the artistic from the scientific part. It is a double character of research medicine, similar to that of practicing medicine, which they point out and denominate by the terminology "art and science," the two tasks of research medicine: on one hand, artistically to explore the patients and their cure, to draw clinical pictures and therapeutic entities; on the other, scientifically to explain the disease and drug action, and to transform the engendered creations into physical-chemical terms; on the one hand, to emphasize exhaustion in observation and evaluation in description, to specify the studied subject; on the other, to emphasize the mechanical sequence of the observed situation and to destroy any specificity; on the one hand to apply the measuring method in order to help characterize and visualize certain individuals as a constitutional type; on the other, to apply the measuring method in order to generalize, to specialize (but not to specify) the individuals completely; on the one hand, to be permanently conscious of ever new, ever creative nature (*natura naturans*); on the other, to consider the infinity factor as rather small in medical research (*natura naturata*).

Many other terms are used to characterize these two confronting attitudes: empirical and rational, realistic and theoretic, biologic and mechanic, Hippocratic and Galenic,[3] (more) idiographic and nomothetic (the last two terms were originally coined in order to differentiate the viewpoints of history and the exact natural sciences: "to describe what once (!) has been, and to state what always is").

---

[1] Neo-Hippocratic Tendencies of Modern Medical Thought. Med. Life, 41:115-146, 1934.

[2] Skillfulness and craftsmanship reveal according to this differentiation art insofar as they reveal the specificity of a given situation (as for instance, art in a performance of acrobats or art as manifested in a very thoroughly constructed machine).

[3] Hutchins' interpretation of Galenic (Surg. Gynec. & Obst., 58:420, 1934) seems rather isolated.

Comparing the two meanings which have been given to the phrase "art and science" of medicine, one will agree that the second offers several advantages over the first. It embraces the first without restricting it within itself in any way. It uses the term "art" in its most specific sense. It is also more precise from the philosophical standpoint. It realizes the philosophical consideration that the generalizations of the mechanical sciences are due to their character, insufficient to completely comprehend an experienced situation for human thinking. (Leibnitz, who assumed that all *verités de fait* have their sufficient reasons in the *verités éternelles*, postulated this assumption only for divine thinking). It calls attention to a field of research for which there is not much room in the first, and as Faber writes in his "Nosography in Modern Internal Medicine":[4] "Every time any important advance is made in this field it is considered in the clinic to be a great feat, and the description of a new disease is of extremely great importance in practical medicine. To the physiologist and the worker in the laboratory, morbid categories are subordinate concepts, but to the physician, to the clinician, the reverse is the case; he cannot live, cannot speak, cannot act without them." The second differentiation finally gives more shape to the historical aspect of medicine. The curves of the way of medical history do not seem to be so exclusively externally conditioned, so little developed by medicine itself, in the second as in the first differentiation. In the first differentiation, the way of medical history is ideally straight, and only in concrete reality bent off by more or less external obstacles; today by more than in the period just past. In the second differentiation, the way of medical history is ideally a spiral path, oscillating between art and science as it ascends, while reality only adds its deviations. And while the practicing clinician must always be equally both—and the individual research clinician usually is both—an artist and a scientist, research clinicians in general seem to prefer at given periods of history either the artistic or the scientific approach. Today we seem to be on a turning point from a scientific to an artistic period.

Peritonitis, Not Appendicitis, Causes Death.—Patients die of spreading peritonitis, *not* because of appendicitis, John O. Bower, M.D., Philadelphia, points out in *The Journal of the American Medical Association* for January 7.

The surest method of reducing the mortality of spreading peritonitis is to hospitalize patients before their appendixes have ruptured. Routine operation as it pertains to the management of acute appendicitis and its complications, usually peritonitis, should be limited to the appendix that has not perforated. When the serous coat—the covering of the appendix containing the serum—is intact, it makes no difference whether the inflammation in the tissue beneath is catarrhal, discharges pus or is gangrenous; one patient in 183 dies.

Scientific management based on the development and the preservation of local and general immunity should be carried out when the serous coat of the appendix is ruptured.

ORIGINAL ARTICLES

EXPERIENCES WITH COLECTOMY*

By G. D. Delprat, M.D.
and
Alanson Weeks, M.D.
San Francisco

Discussion *by Alfred C. Reed, M. D., San Francisco; Malcolm R. Hill. M. D., Los Angeles; William H. Daniel, M. D., Los Angeles.*

We wish to offer for consideration four cases of ulcerative, inflammatory, and stenosing lesions of the colon and terminal ileum. One of these patients has been reported previously. These patients present three different types of colitis or ileocolitis, and are, therefore, of interest.

The first two patients, E. H. and D. S., whose clinical record will be reviewed presently, suffered from what was apparently a spontaneous ulcerative colitis with symptoms of diarrhea, some tenesmus, bleeding from the bowel, anemia, lower abdominal pain, and progressive weight loss. The symptoms were classical and the diagnosis offered no particular difficulty. Cultures from the stool showed abundant hemolytic streptococci, so that we conclude that these organisms constituted the etiological agency. The treatment was at first that customarily given to patients with tubercular lesions of the bowel, supplemented with an ileostomy to divert the fecal stream from the involved intestine. In one patient, D. S., this was sufficient to prevent further toxic symptoms (that is, as long as the ileostomy functioned); in the other patient, E. H., this palliative treatment was insufficient, and was, therefore, followed by colectomy. The third patient, J. O'N., previously reported, suffered first from an amebic infestation of the colon. The ulceration caused by the ameba, together with the reparative efforts of the bowel, produced a combination of ulcerative colitis and pseudopolyposis. When, after proper treatment, the ameba were no longer present, ulceration of the bowel continued and streptococci were cultured from the stool. This patient represents a streptococcal invasion of previously produced ulcers. Palliative treatment, with ileostomy, was insufficient to produce clinical improvement, and colectomy was performed.

The fourth patient, K. D., represents a picture that is entirely different, undoubtedly belonging to that type of ulcerative, stenosing, fistula-forming group of patients that Crohn and Ginzberg, in 1932, defined as "regional ileitis." Since 1932 many other cases have been reported, from which it is apparent that the disease defined by Crohn is not confined to the terminal ileum (as is the thirteen cases they reported), but may involve almost any part of the small and large intestine. This patient's disease was progressive in severity, and involved widely separated areas of the intestine, namely, the terminal ileum, the sigmoid and the rectum, with apparently

Read before the General Surgery Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

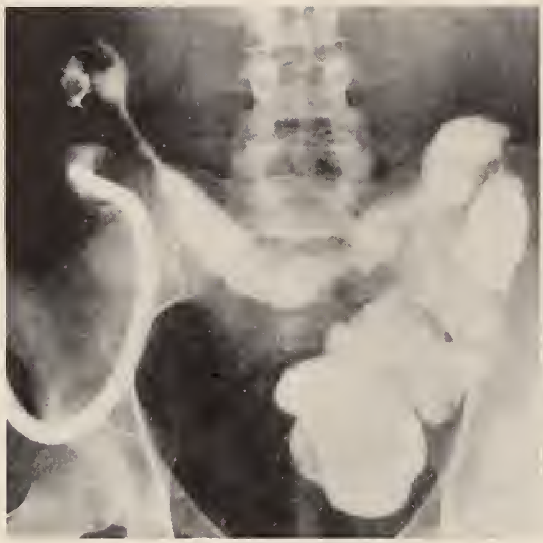

Fig. 1

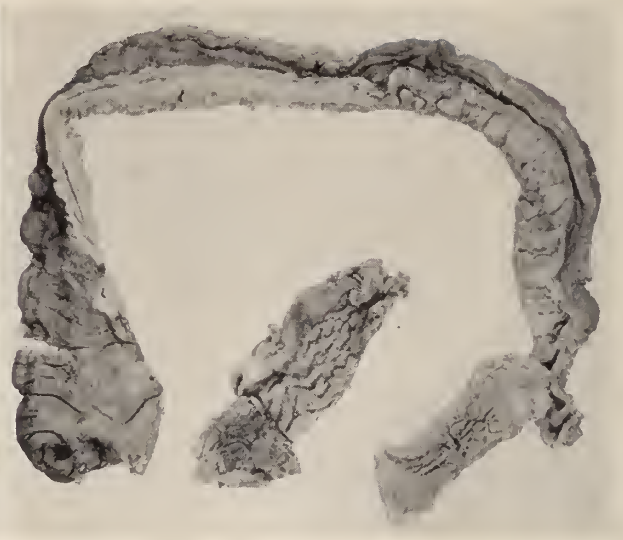

Fig. 2

Fig. 1 (Patient 2).—Barium enema was given through the colostomy opening outlining the proximal portion of the colon. The barium flows readily to the cecum without obstruction. The ascending colon and distal two-thirds of the transverse colon are somewhat spastic and smoothed out. There is a fine irregularity of this portion of the bowel, suggesting colitis. The ascending colon shows good haustral markings. The cecum is low in the pelvis, and is slightly movable and slightly tender. Conclusion: The x-ray appearance is that of ulcerative colitis of the transverse and descending colon.

Fig. 2 (Patient 2).—Specimen removed, including some portion of ileum, entire colon and anus. Rectum and anus constitute the separate portion in the center of the plate; the thickening of the colon is well illustrated.

normal areas between these lesions. After palliative measures had been performed, the disease continued to extend. First, a resection of a portion of involved ileum, then an ileotransverse colostomy, and later a complete colectomy (without the rectum), were performed. Even then the entire involved area of the terminal ileum was.not removed, and recurrence of the disease with fistula formation occurred proximal to the terminal ileostomy. Resection of another eight inches of ileum has apparently effected a cure; at least, the patient has had no symptoms of ulceration and no new fistulae in the last twelve months.

The fourth patient's history will be presented in some detail on account of unusual symptoms (tetany), which we have not noticed elsewhere in the literature.

COMMENT

In regard to colectomy, we shall state that it is an operation not to be considered lightly. Patients who need this operation for ulcerative colitis have suffered previously for a long period of time, are debilitated, anemic, and are poor operative risks. However, on the other hand, they have, to a certain extent, become immunized to the organisms that infect the bowel, and hence breaks in operative technique have not been as serious as might be expected. In all three patients upon whom colectomy was performed, soiling of the abdominal cavity undoubtedly occurred, and although the postoperative course was stormy, the patients did not develop peritonitis or abdominal abscesses. In all cases there was marked infection of the operative incision, but this apparently was confined to the subcutaneous tissues, since the fascias are firmly healed and there is no postoperative hernia.

For some months postoperatively there has been difficulty in controlling the discharges from the ileostomy. At first, these are very liquid, but in two of the patients, J. O'N. and E. H., they have become semisolid and quite intermittent. In the last patient the control of the fecal stream is still quite unsatisfactory. Discharges from the ileum are considerably more irritating to the skin surface than those from the sigmoid.

In removing the colon, in all cases care must be taken to preserve the omentum. (Presentation of slides by the authors.)

CONCLUSION

Ulcerative lesions of the ileum and colon should be treated by complete ileostomy. If the symptoms are not relieved by this procedure, complete colectomy is indicated.

REPORT OF CASES

Case 1.—D. S. Age, twelve.

1. Admitted on October 23, 1932—October 24, 1932. (Service of Best & Brooks.)

Diagnosis.—Anemia, dehydration.

Hemoglobin, 100 per cent; red blood cells, 5,800,000; white blood cells, 21,700; polymorphonuclears, 75 per cent; eosinophils, 3; basophils, 2.

2. Admitted on November 2, 1932—February 11, 1933. (Service of Weeks, Pflueger, and Delprat.)

Ulcerative colitis: secondary anemia.

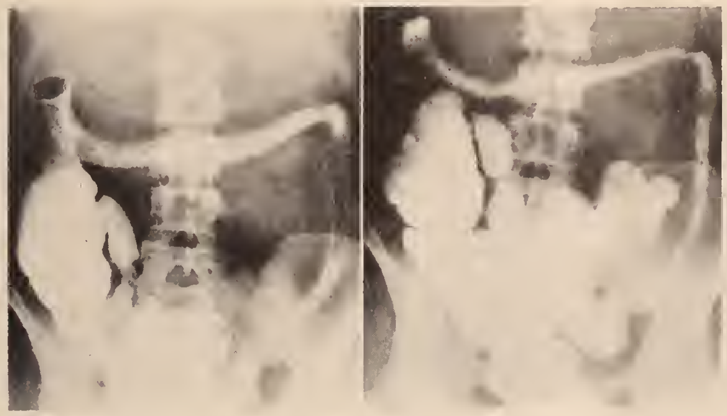
Operation: Ileostomy on December 16, 1932. Resection loop ileum projecting, February 4, 1933.

Complaint: Diarrhea since 1929.

Family History.—Negative.

Past History.—Birth and infancy normal. Normal development. Pertussis and mumps in 1925; measles and chickenpox in 1926. General health good until present illness, except for persistent constipation. Tonsillectomy in 1924. Last year (1931?) patient had an "attack of dysentery"; watery stools since. For the past few months, four to six watery stools daily, with some blood. No fever. Appetite poor. Losing weight last month.

Present Illness.—October, 1929. Two and one-half years ago patient suddenly had three liquid stools, chocolate-colored. Since that time has not had a normal movement.



Figs. 3 and 4

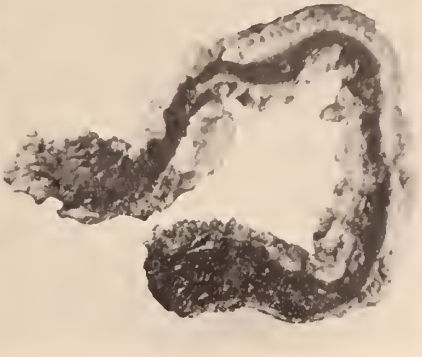


Fig. 5

Figs. 3 and 4 (Patient 3).—Heart and arch within normal limits. The lung fields are clear. The esophagus is normal. The stomach is of good tone and smooth in outline. The cap is smooth and fills well. There is no delay in the duodenum. At six hours the meal is in the terminal ileum and cecum. There is a trace of barium scattered through the cecum. The transverse and descending loops are smoothed out and narrowed suggesting colitis. At twenty-four hours there is a small amount of barium in the cecum and appendix. The remainder of the bowel is empty. The barium flows rapidly to the cecum without obstruction. The hepatic flexure, transverse and descending colon are spastic and smoothed out. There are haustral markings present. The posterior half of the ascending colon is of normal caliber. The barium runs back into the terminal ileum. The sigmoid does not appear to be involved, as it is of normal caliber. The appendix is partially filled. Conclusion: Colitis.

Fig. 5 (Patient 3).—Entire colon and cecum—on the right of the plate; rectum on the left.

Very frequently stools have had dark blood—never bright red blood. Occasionally, for a period of one or two months, she has had only one liquid movement a day. For the past few months she has had four to six movements daily. When diarrhea was bad, was much bloated and passed very foul gas. Stool also had foul odor. Had lost weight and tired easily. Easily upset, mentally. Had not had fever at any time. Had trouble keeping warm. Skin was dry, wrinkled, cracked easily during illness. Had nausea and vomiting when diarrhea was bad. Often soiled herself if unable to reach toilet in time. Never got up at night.

Physical Examination.—Fairly well developed and nourished. Appeared somewhat peaked. Nothing found except somewhat firm, slightly tender abdomen, especially along course of colon. Abdomen full, tympanitic with active peristalsis. Rectal tenderness in entire rectum.

Blood: Hemoglobin, 73 per cent; red blood cells, 4,500,000; white blood cells, 9,000; polymorphonuclears, 45 per cent.

Urine: Four to five white blood cells. Tuberculin, positive twenty-four to forty-eight hours.

Stool: Liquid, brown, some mucus, some flakes of blood. Occult blood positive; Gram-negative. Gram-positive bacteria and pus cells in smears. (*Stool culture:* Bacillus coli; moderate number of Streptococcus viridans.) Bleeding, coagulation times normal.

Proctoscopic Examination.—May 10, 1932. Mucosa pinkish, thickened with flakes of white mucus, purulent. No ulcers, but numerous pin-point hemorrhages scattered about uniformly from a depth of ten centimeters down to the columus of Morgagni.

Barium Enema.—May 12, 1932. Preliminary films of the abdomen showed some calcification in the right side of the pelvis. Colon was normal, as examined by the opaque enema. November 8, 1932. The barium flowed readily to the cecum without obstruction or defect. The bowel was quite irritable and the enema was retained with great difficulty. The haustral markings of the descending colon all smoothed out. There was some spasm of the descending colon. Conclusion: Colitis.

Course in Hospital.—The child continued with the symptom of diarrhea, abdominal cramps, occasional nausea and vomiting, from November 2, 1932 to December 16, 1932. During this period various forms of treatment were undertaken, with varying degrees of success. Diet: "Colitis diet"—cottage cheese, fermilac. Medication: Paregoric, intravenous glucose, calcium gluconate, viosterol, parathormone, liver, iron (Lilly), and sedatives. Other treatment: Diathermy to abdomen, vaccine (autogenous from bowel streptococci).

Blood Phosphorus.—November 29, 1932, 2.7 milligrams; December 12, 1932, 3.6 milligrams.

Blood Calcium.—November 29, 1932, 8.3 milligrams; December 12, 1932, 10.9 milligrams.

Bacteriological Examination of Stool.—Numerous Gram-positive diplococci with capsules, some Gram-negative cocci, few short streptococcal chains, moderate number of Gram-negative rods; no acid-fast bacteria, no cysts, ova, or parasites. Culture: No growth of lactose fermenting organisms, growth of lanceolate cocci (chained pairs, enterococci). Vaccine was made of latter.

During this period of treatment the patient's temperature, although said to be normal before entering the hospital, rarely was normal, fluctuating between 37 and 40. Pulse varied between 90 and 110. Following surgery on December 16, 1932, the temperature fell sharply to normal (without even the customary postoperative rise) and practically remained so until discharge from the hospital.

Since obviously the conservative type of treatment was hardly successful, diversion of the fecal stream from the colon was, therefore, considered.

Operation.—December 16, 1932. (Doctors Weeks and Pflueger.) Right rectus incision. There was considerable amount of clear fluid in the abdomen. The cecum was examined and, to appearance and palpation, was negative. Further exploration not done. Appendix removed. Loop of ileum just proximal to the cecum was drawn out of the lower angle of the wound. Abdomen was closed.

The projecting loop of ileum was opened the following day, and the redundant piece of ileum removed on February 4, 1933. Pathological examination of this tissue showed no abnormality.

The patient was readmitted to the hospital on April 8, 1935. During the past twenty-six months the rectal tenesmus had markedly improved. For a few weeks after discharge from the hospital there had been rectal bleeding and a foul mucopurulent discharge, but with occasional warm salt irrigations this had improved and the patient appeared to be practically well. Barium enema showed the colon to be small, somewhat spastic. It was thought that it would probably be safe to attempt to revert the fecal stream through the colon, and consequently, on May 24, 1935, closure of the "double-barrelled" ileostomy was undertaken with a right-angle clamp after the manner of Mikulicz.

As soon as the fecal stream entered the colon, however, all the old symptoms of cramps, blood diarrhea, and nausea returned. Fortunately, after a short time, the fecal stream practically all reverted to the ileostomy opening, and now the entire fecal stream passes through the ileum, which has prolapsed two or three inches through the abdominal wall.

As long as the ileostomy functions the patient is symptom free, and a colectomy is, therefore, not necessary at the present time.

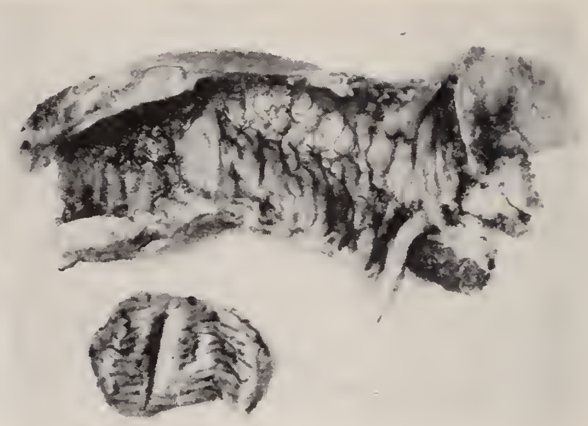

Fig. 7

Fig. 6 (Patient 4).—Specimen removed as illustrated in diagrammatic sketch.

Fig. 7 (Patient 4).—Portion of ileum removed May, 1937. Terminal ileum, showing thickening of the wall and inflammatory changes.

Case 2.—E. H. Female. Age, twenty-one.

First admission, May 2, 1933—June 18, 1933.

Complaint: Bleeding from rectum for four months. Loss of weight. Weakness.

Present Illness.—On last New Year's Day (January 1, 1933), noticed small amount oozing from rectum and anus, which occurred spontaneously and lasted a few minutes. Bleeding has continued at least once a day since, usually preceded by abdominal cramps that subside as the bleeding commences. More frequent in forenoon, after breakfast, but often also at other times. During last week, four or five times a day, and increasing amount, being about a cupful at each time. Passage consists of bright-red blood mixed with mucus. Also had a dull lower abdominal ache that was more or less persistent. No nausea or vomiting. No pain with defecation. Bowels always only moved with enemata. Loss of weight is ten pounds in last four months, and patient growing progressively weaker. She has always been well before onset of present illness.

Past History.—No familial diseases. Occupation, clerk. Weight, 130; present weight, 112. Menstruation began at the age of twelve, May, 1928.

Physical Examination. — Examination essentially negative, except for some tenderness in the lower abdomen.

Blood: May 2, 1933. Hemoglobin, 67 per cent; red blood cells, 3,840,000; white blood cells, 8,600; polymorphonuclears, 67 per cent.

Urine, negative. Wassermann and Kahn, negative.

Operation. — (Doctor Morgan.) Sigmoidostomy — right paramedian incision. Left colon edematous, injected, and showed evidence of acute visceral peritonitis. The wall was definitely thickened, although no tumors were felt. The colon just above the peritoneal reflection was smaller than normal, but the walls were thickened and the lumen definitely reduced in size. At this point a nodular gland was felt in the bowel wall. A few of the glands of the left mesentery were edematous. There was a small amount of free fluid in the abdominal cavity which suggested a streptococcal infection. The remaining colon was negative, except that the capillaries were injected. Sigmoidostomy was done through a high left inguinal incision.

Biopsy Report.—Small fragment of colon mucosa, hemorrhagic, covered with pus cells in ulcerated area. Glands slightly distorted by inflammatory reaction, but not malignant. Examination of stool showed purulent foul liquid. Occult blood three plus; mucus normal. Microscopic: Mass of red and white blood cells and bacteria. Negative for ova, cysts, or parasites. Negative for typhoid, paratyphoid, and dysentery groups.

The patient suffered a rather stormy postoperative period, during which temperature ranged between 39 and 40 for about three weeks, and then gradually reached normal at the end of the fourth week, with pulse ranging between 110 and 130. During this period blood cultures were negative, and the patient received three whole blood transfusions of 750 cubic centimeters each. On May 14, 1933, she developed a bilateral parotitis, which gradually subsided, and the patient left the hospital on June 18, 1933, against the advice of the attending staff.

An x-ray examination on May 3, 1933, concluded with the statement: "No evidence of tumor mass or obstruction. The irritable spastic appearance of the distal half of the colon suggests ulcerative colitis."

Second Admission.—August 4, 1933—October 3, 1933. Patient stated that since leaving the hospital, on June 18, 1933, she has been getting along splendidly; however, there has been some passage of blood and mucus from the rectum, but none from the colostomy wound. She has been receiving rectal instillations, and the blood is noticed only afterward. Three weeks ago, four days after the difficult extraction of an abscessed tooth, she noticed blood appearing from the colostomy. This bleeding has become more active and is now almost continuous. Hemoglobin, 63 per cent; red blood cells, 3,480,000; white blood cells, 7,700; polymorphonuclears, 50 per cent. Urine negative. Stool examinations (six specimens) negative for ova, cysts and parasites, typhoid or dysentery groups. Some 75 per cent of organisms Gram-negative. One specimen contained a budding and yeast-like branching fungus. During this period of hospitalization the patient had a fairly wide septic swing in her temperature chart, although the pulse usually remained about 90. Treatment consisted of tannic-acid instillations into the rectum, colitis diet, liver extract, carbarsone, visform, tincture of opium, and bacteriophage (prepared by Doctor Schultz of Stanford University).

Third Admission.—July 9, 1934—July 11, 1934, for treatment for anal fissure.

Fourth Admission.—June 6, 1935—June 22, 1935. Complaint of substernal pain. Treatment for colitis as above indicated.

Fifth Admission. — August 7, 1935—August 18, 1935. During interval had been treated by Dr. P. A. Taylor with barium, kaolin, dicalcium phosphate, and Haliver Oil, and has gained weight, now weighing 136 pounds. Hemoglobin, 84 per cent; red blood cells, 5,200,000; white blood cells, 15,300; polymorphonuclears, 51 per cent; eosinophils, 2; lymphocytes, 45; endothelial, 2.

Sixth Admission.—September 24, 1935—January 5, 1936. (Treatment: Ileostomy, appendectomy, September 27, 1935.) (Doctor Morgan.) Three transfusions.

Owing to the evident inflammatory lesion above the sigmoidostomy, Doctor Morgan performed an ileostomy about ten centimeters proximal to the ileocecal valve. The immediate postoperative course was good, but the patient required a great deal of intravenous therapy to offset the excessive loss of fluid from the ileostomy. Since the patient had poorly developed surface veins, continuous venoclysis was administered for several periods by means of an indwelling canula. During this time she suffered very severely with abdominal cramps, crying and writhing with pain unless given relief by opiates.

On about October 25, 1935, the patient apparently developed an acute ileitis, having elevated temperature, pulse, 13,300 white blood cells, 68 per cent polymorphonuclears, and marked vomiting, apparently of the obstructive type. Treatment consisted of continuous gastric lavage, intravenous therapy, compresses to the abdomen, and whole-blood transfusions. Under this treatment she gradually improved until her discharge on January 5, 1936.

Seventh Admission.—June 29, 1936—July 3, 1936. Felt well until one month ago, when she suffered from dull, aching pain in the upper abdomen, and the passage of more blood from the rectum and colostomy. Received 150 cubic centimeters of blood from brother, immunized with antigen.

Eighth Admission.—July 21, 1936—November 22, 1936. Operations: Transfusion, July 21, 1936; colectomy, resection rectum and anus, transfusion x 2, September 1, 1936; pyelography and kidney lavage x 6, October 20, 1936—November 18, 1936. Readmission, with same complaint of severe abdominal cramps, passage of blood through the colostomy and through the rectum. At this time the same general treatment was continued, but owing to lack of progress complete colectomy was advised.

Operation on September 1, 1936. Nitrous oxid, ether anesthesia. Operation, 8:53 to 10:25 a. m. Preoperative diagnosis: Ulcerative colitis. Postoperative diagnosis: Same. Procedure: A long, right rectus incision made to the left of the previous ileostomy, and at the lower end through the previous operative scar which was excised. The abdomen was opened cautiously, and the omentum was found adherent along the entire anterior abdominal wall beneath the incision; this was separated. The cecum was grasped and the proximal and distal loops of ileum at the ileostomy identified. The distal ileostomy loop of ileum was divided and the portion attached to the abdominal wall closed and invaginated. It was about one and one-half inch in length. This allowed some mobility of the head of the cecum, and by dividing its lateral and posterior attachments it was easily brought up into the wound. The omentum was very thin and poorly developed, but it could be separated from the transverse colon without difficulty. The lateral attachments of the peritoneum to the ascending and descending colon were divided, and the entire colon down to the point of the sigmoidostomy was resected without difficulty. At the region of the sigmoidostomy, adhesions from the previous operation, and the inaccessibility of the bowel, made this portion of the resection technically difficult. The opening in the bowel at the sigmoidostomy was suitably covered, and the resection carried down to the lower rectum. The rectum was divided with a cautery, the lower end closed with a suture, and the entire colon above removed *in toto*. Closure of the pelvic floor and immediate removal of the anus and lower rectum completed the operative procedure. The patient was transfused with 500 cubic centimeters of whole blood. Operation: Colectomy, complete; resection of anus. Transfusion—direct method.

Following the operation there was a sharp rise of pulse to 110, which slowly dropped to 90 in about eighteen days. The temperature rose to 38.5, where it remained for several days, becoming thereafter irregular—between 38 and 39.8—and again practically normal on October 1. On October 24 she began to show signs of cystitis and pyelitis, and was treated accordingly by Doctor Player, having to undergo several kidney lavage treatments.

Cultures from the left kidney urine showed, first, B. coli. and later nonhemolytic streptococci were obtained from each kidney urine. However, by November 22, 1936, she had been afebrile for over two weeks, and was discharged in good condition.

* * *

Case 3.—J. O'N. Age, thirty. (Previously reported in the *Journal of the American Medical Association*, Vol. 107, No. 26, p. 2121, December 26, 1936.) Infection with ameba in 1925. Subsequent treatment with disappearance of ameba, but continuation of diarrhea with progressive toxemia, dehydration, anemia, and weight loss. Seen by us in August, 1935, when ileostomy was done. Symptoms not relieved, and colectomy performed on January 21, 1936.

* * *

Case 4.—K. D. This patient first came under our care in October, 1930, at the age of twenty-two. She had been well until April, 1925, when she developed malaise, coryza, upper abdominal pain, and muscle-joint pains. These symptoms persisted for a week. She then commenced to have a diarrhea of four to five stools (sometimes more), and this has persisted with short intermissions until the present time, 1938. She was able, however, to continue at school and was graduated in 1930. Commencing about May, 1925, she suffered from cramps in the arms, thighs, calves, and feet. The cramps were extremely painful, knotting up the muscles and causing much distress; and although relieved somewhat by compresses, massage, and exercise, they have continued down to the present time.

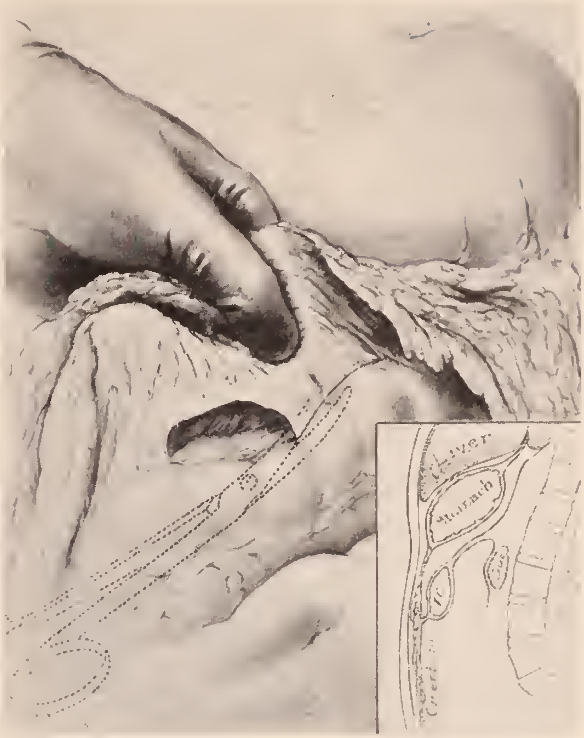

Fig. 8

Fig. 8 (Patient 4).—Separation of omentum from transverse colon.

In June, 1929, she suffered from a severe pain in the right lower quadrant, which led to the diagnosis of appendicitis for which she was operated. We have been unable to obtain the pathological findings of this operation, but the patient thinks the right tube and ovary were removed. A very stormy convalescence followed, with septicemia and abscess formation in the left buttock. Abscess was incised and drained three months. Hospitalization, two months.

On August, 1930, the patient reported to Doctor Coblentz with complaints of diarrhea, loss of five pounds in weight in a month, cramps in legs and feet. Complete physical examination was negative, except for right rectus scar, scar on left buttock, and tenderness in the right iliac fossa. No masses were felt. Pelvic examination showed virginal introitus, a fixed uterus, and fullness "like a mass" in the cul-de-sac. Rectal showed a relaxed sphincter and a few small polypi on the posterior rectal wall. Hemoglobin was 60 per cent. Urine was negative. Stool: Large amounts of mucus, few red blood cells, no ova or parasites. A diagnosis of colitis was made, and the patient was treated with kaolin and a diet.

In October, 1930, the patient developed a large, hard and tender mass beneath the right rectus scar, and was admitted to St. Luke's Hospital on our service. Bimanual palpation showed this to fill the pelvis with the consistency of a hard malignant tumor. With compressing, it seemed to soften, and in a few days a small nick at the lower end of the scar allowed about one ounce of yellow pus to escape, with much subjective relief to the patient, but with little decrease in the size of the mass. Pus culture yielded only B. coli, although smears showed a few cocci. Lipiodol injection showed by x-ray that a small sinus was present, confined to the abdominal wall. By November it appeared, from the nature of the discharge, that the sinus was connected with the small intestine, as was proved later by x-ray studies when a fistula of the lower ileum was demonstrated. Blood count at this time: Red blood cells, 4,180,000; hemoglobin, 56 per cent.

Operation.—On January 30, 1931, the patient was subjected to a laparotomy by Doctor Weeks.

Preoperative Diagnosis.—Fecal fistula.

Postoperative Diagnosis.—Fecal fistula.

Procedure.—Resection of portion of ileum, with end-to-end anastomosis.

Anesthesia.—Spinal (Doctor Lawrence), 10:47 a. m. to 12 noon.

Operation.—Incision surrounding the old scar carried down to the fascia on both sides of the fistula. Scar dissected back until only the small opening of the fistulous tract remained, and this was closed with a clamp. Clean abdominal cavity was entered through the old scar above and below this point. Thin, filmy, omental adhesions were separated, allowing the abdominal wall to be lifted from a mass of adherent loops of ileum covered with densely adherent omentum. This mass could be lifted out of the abdomen. The small intestine was very carefully separated, and a segment about 12 to 14 inches long was found to be very much thickened with old inflammation. This thickening extended well down into the mesentery. Above and below this area the intestine appeared normal. The abnormal portion was resected and an end-to-end anastomosis done, leaving about six inches of terminal ileum proximal to the ileocecal valve. The cecum and ascending colon appeared normal.

Pathological examination of the intestine showed only chronic inflammatory tissue, with no malignancy or tubercles.

The immediate postoperative condition was good, but at 4 p. m. the patient suddenly developed profound shock, the blood pressure falling in a very short time so that it no longer could be determined, the radial pulse became imperceptible, and the patient became comatose. Glucose intravenously, and a 750 cubic centimeter whole blood transfusion, however, worked a miraculous transformation, and the patient rallied as rapidly as she had failed. The following morning she felt fine, except for a backache. Convalescence was uneventful, with primary wound healing until February 10, when the temperature rose to 38, pulse to 140, white blood cells 22,000, polymorphonuclears 88 per cent, and the patient complained of pain beneath the incision. There seemed to be a fullness beneath the incision; and although a clamp was inserted beneath the wound, no abscess was encountered. A transfusion of whole blood, 500 cubic centimeters, was given. By February 16, the temperature and pulse had become normal, and on March 15, 1931, she was discharged from the hospital, with hemoglobin 49 per cent, red blood cells 3,730,000, white blood cells 5,100, polymorphonuclears 58 per cent. On April 22, 1931, the hemoglobin was 85 per cent. The abdomen was perfectly healed, felt fine, taking daily sun baths.

On April 26, 1932, the patient reported to the office, feeling listless and tired. Had noticed discharge of pus from rectum. No pain or discomfort. Examination is recorded as follows: "Mass, size of three fingers, reaching up into the perineal body within the wall of the vagina, mostly on the left side. The perineal body is tense and glassy looking, as hard as malignancy. There are two or three sinuses in it on both sides of the midline. Probe goes into the middle of the perineal body as if there were an abscess in the region. Stricture just within the anal canal. Tissues all around this very hard." Frei antigen test (lymphogranuloma inguinale) negative. Blood calcium (on account of cramp in legs and feet) normal, 9.7. Biopsy of tissue from perineum showed moderate pus and round-cell infiltration, chronic inflammation. No tuberculosis or malignancy. Treatment consisted of opening the sinuses and packing the inflamed area with gauze soaked with saturated solution of potassium permanganate, and x-ray treatment. It was soon apparent that no improvement would occur unless a colostomy was performed above the inflamed area, and on August 23, 1932, a sigmoidostomy was done. At this operation the abdomen was found free of adhesions, and inspection of the anastomosis of the ileum showed it to be in excellent condition. There were many adhesions, however, about the head of the cecum which were not disturbed. No enlarged lymph glands were noted in the mesentery. After operation, diarrhea persisted through the colostomy opening. The stool from the colostomy was thin, mucoid, and negative for blood, cysts, and pus. Bacteria nearly all Gram-negative bacilli with a few enterococci and a few staphylococci. Opiates, kaolin, bismuth and bowel irrigations did not help the diarrhea much. Probably the opiates were the most effective. Bacteriophage was prepared and given, with no improvement. Calcium in large doses did not improve the muscle cramps. For some time after the colostomy the patient was fairly comfortable. The cramps in the arms and legs were less frequent. However, after two or three months the cramps became worse, and the patient suffered severe pains in the right lower quadrant. The two complaints seemed to be related. Studies with x-ray showed partial obstruction at the ileocecal region, with distention of the ileum. (Blood chemistry studies were normal. Frei test was negative.)

Consequently, on December 30, 1933, operation was performed by Doctor Weeks, and a large inflammatory mass was found in the right iliac fossa which was very firmly attached. This was the cause of the obstruction. Many enlarged lymph nodes were noted. The inflammatory mass was not removed because of its acute character, and a ileocolostomy was performed between the normal ileum and the transverse colon. The anastomosis was technically perfect, without soiling, but within two weeks fistulae had formed leading through the recent abdominal wall, both to the cecum and to the new anastomosis. The patient was thus discharging from three places—the sigmoidostomy and these two fistulae. Biopsy from the ileum at operation on December 30, 1933, reads as follows: "Edematous wall with mucosa, showing infiltration of polynuclears and eosinophils between normal glands. Submucus coat edematous with diffuse eosinophils and round cells. Muscularis is invaded by eosinophil and round-cell infiltration along the lymphatics, and serosa contains round-cell foci. Picture is that of a nonspecific inflammatory condition without tubercles or malignancy."

In the meantime, however, the sigmoidostomy was giving trouble. The proximal loop had become hard and constricted for about three or four inches. The distal loop was large and patulous and soft. The constriction of the proximal loop continued until it would barely admit a lead pencil. Frequent x-ray studies were made, from which it appeared that the hepatic flexure, just to the right of the old ileocolostomy, would be most accessible for a temporary colostomy, which, accordingly, was done on September 21, 1935. This colostomy, however, never functioned satisfactorily, and the patient definitely was going downhill. The cramps in the legs were increasing in frequency and severity, and it was obvious the only corrective procedure that would have some fair prospect of relief was complete colectomy. Blood chemistry studies at this time were: calcium 11, phosphorus 2.8, cell diameter 6.1, volume index 65, red blood cells 5,000,000, hemoglobin 70 per cent, white blood cells 10,000, polymorphonuclears 82 per cent.

October 8, 1936—*Operation:* Gas, oxygen anesthesia. Two ounces ether. Operation, 8:43 to 9:25 a. m.

Preoperative Diagnosis.—Ulcerative colitis and ileitis.

Postoperative Diagnosis.—Same.

Procedure.—Long, left rectus incision close to the midline. There was a small amount of fat in the upper portion of the abdomen and about an inch at the lower portion. The rectus sheath was opened and the muscle displaced laterally. Peritoneum was incised and there were found to be no adhesions to the abdominal wall beneath the region of the incision. Abdominal wall was lifted up and the area inspected around the point of the sigmoidostomy, around the region of the colostomy of the hepatic flexure and in the ileocecal region, with the following findings: The terminal ileum for a distance of about two feet was dilated, and the wall was thickened, lacked tone and was indurated and grayish-pink in color, but proximal to this point it appeared to be reasonably good. The ileum was traced to the point of anastomosis to the transverse colon; from this point it was traced to the ileocecal region, but the portion of ileum between the ileocecal region and the ileocolostomy was very much more inflamed looking than in other portions. The head of the cecum and ascending colon were contracted and indurated, and formed a more or less solid mass which was adherent to the anterior abdominal wall over an area of about a half-dollar. At this point a fistula extended through the anterior abdominal wall, coming out at the lower end of the right rectus scar on the abdomen. The colon on either side of the colostomy in the region of the hepatic flexure looked reasonably normal for a short distance. The transverse colon appeared to be quite healthy-looking until one leads to a point about six inches proximal to the sigmoidostomy, and during these six inches the colon was thick, hard, contracted and rigid. The sigmoid distal to the sigmoidostomy appeared atrophic as if from disuse, but did not appear inflamed. The rectum was small, atrophic and shrunken, and the floor of the pelvis was hard, with scar-tissue formation. The uterus was in an anterior position, but was down low in the pelvis and appeared stuck in this scar tissue so that it could not be easily raised. The left ovary was down behind in the left fornix, where it was pretty well adherent. Commencing at the point where the ileum was still reasonably normal, two clamps were placed and the ileum divided by the cautery. The ileum was then dissected loose from its mesentery between ties. This portion of the mesentery of the terminal ileum was quite thick—being about three-eighths inch through—and contained numerous glands. However, ligation was undertaken across this region for fear that ligation in healthier-looking mesentery would jeopardize the circulation of the portion of ileum which was to be left in the abdomen. The lateral attachment of the cecum was divided, and the whole ileocecal region swung up out of the abdomen without much difficulty. The omentum was freed from the transverse colon and the mesentery of the transverse colon ligated. The colostomy at the hepatic flexure was cut loose from the abdominal wall and the transverse colon, and splenic flexure resected down to the sigmoidostomy. The distal loop of the sigmoidostomy was divided between clamps by a cautery, and the distal portion of this division closed over with chromic intestinal suture and dropped back into the abdomen. The sigmoidostomy was then cut loose from the abdominal wall, which therefore allowed the removal of the colon to this point and about two feet of ileum. Bleeding points were ligated. The two openings of the abdominal wall were closed, although not very effectively, because of the fact that the tissues were inflamed and extensive dissection in this area was undesirable. The abdomen was closed with continuous suture and retention sutures in the usual manner, bringing out the terminal ileum at the lower end of the wound, where it was held closed by clamps. Operation: Colectomy.

Subsequent to the colectomy the patient developed another fistula very close to the terminal ileostomy. X-ray studies showed that it communicated with the terminal ileum, very close to the ileostomy. On May 29, 1937, this condition was corrected by operation as follows:

Preoperative Diagnosis.—Ulcerative ileitis and fistula formation.

Postoperative Diagnosis.—Same.

Procedure.—Incision was made in the left abdomen, through the previous abdominal scar surrounding the fistula. By careful dissection the abdomen was opened—the fistula was found to enter into the ileum. The ileum was loosened from its attachment around, and the fistula was found entering one side of the ileum. From that point the ileum made a fairly short loop of about eight inches to the ileostomy stoma. The ileum was divided proximal to the fistula, and that portion distal to it was resected. Attached to the lateral side of the ileostomy fistula was a loop of jejunum which was densely adherent, and undoubtedly entered into the fistula. This portion of the jejunum was resected and and end-to-end anastomosis performed. The remainder of the abdomen was remarkably free of adhesions. The abdomen was closed in layers, drawing out a fairly long piece of ileum, and holding it with clamps. Operation: Resection of fistula. Ileostomy. End-to-end anastomosis.

Since May, 1937, the patient has very definitely improved in appearance, weight, and general well-being. The ileostomy has been difficult to control on account of the looseness of the movements, although paregoric, aluminum hydroxid and kaolin made some improvement. The cramps, however, have continued, although less troublesome, and we have been unable either to control these or ascertain why they occur.

Comment.—A virgin of twenty-two, after brief prodromal symptoms, develops an inflammatory lesion in the ileum with fistula formation. Resection of the apparently involved area does not cure, since the disease recurs in the perineum, cecum, and proximal loop of the sigmoid. These recurrences are not extensions of the disease from contiguous inflammatory lesions, but apparently new lesions of the same disease. Fistula formation is a striking feature of her disease. A more distressing feature of her disease is severe cramps in the legs, arms, and feet. These are unexplained. All blood-chemistry examinations have been normal. Vitamin C was found to be low quantitively at one time, but bringing this to normal did not affect the frequency of the cramps. Colectomy gave relief from sinus formation and improved the patient greatly clinically.

384 Post Street.

DISCUSSION

Alfred C. Reed, M. D. (350 Post Street, San Francisco). I have read with great interest the report of the cases herewith, which brings forcibly to notice once more the great importance of surgical treatment in chronic ulcerative colitis. It is possible that the authors have not sufficiently emphasized the point that the most difficult part of the whole procedure lies in knowing when to intervene surgically. Such intervention requires a definite idea as to prognosis, and this, in turn, depends upon exact diagnosis. Chronic ulcerative colitis is a ragbag of conditions undoubtedly very dissimilar in etiology, and from the whole group various small subdivisions are gradually being isolated. Not knowing the cause of the residual idiopathic type of ulcerative colitis, prognosis becomes most difficult and the time for surgical intervention becomes a matter of individual judgment in the individual patient.

So many cases recover completely with no treatment, and others under different types of treatment, that it seems somewhat extreme to advise complete ileostomy in all ulcerative lesions of the ileum and the colon. I wish the authors had developed this point considerably further.

It is to be remembered, also, that a complete ileostomy, just as a partial or complete colectomy, can be undertaken by skilled surgeons with successful results where under less favorable conditions operative and postoperative results are much less desirable.

I have enjoyed this presentation greatly because all possible points have been covered in it, and the results have certainly been excellent.

⁂

Malcolm R. Hill, M. D. (727 Roosevelt Building, Los Angeles).—The report of four cases of varied interest suffering from disease of terminal bowel has been aptly presented. The authors have presented their experiences in dealing with seemingly insurmountable problems in a unique way. This in itself demands worthy comment as well as the apparent success in applying surgical treatment.

Colectomy has been and still is considered a hazardous procedure. The systematic manner in which these cases with varied complications were handled not only gives hope, but a longer lease on life to these four individuals.

Preliminary functioning complete ileostomy together with the preservation of nature's protective apron, the omentum, have been very ably emphasized. These considerations, along with undoubtedly many other details which are probably ordinary routine to these skilled operators, cannot help but make other surgical specialists envy such ability.

Anus contra nature, whether it be in the form of permanent colostomy or ileostomy, is a worthy substitute for the normal in face of debilitating disease of this portion of the gastro-intestinal tract. This is so in the individual suffering a slow insidious death, as illustrated in the four cases presented, or in the case of the individual facing demise from malignant disease.

It is hoped that this paper will encourage those in the surgical specialty to salvage more of the "human wrecks" similarly afflicted. It is essential that we sell ourselves the idea that we would rather be alive with functioning ileostomy or colectomy than a long time dead. Along with this must come personal attention to the patient, not only during surgical convalescence but as counsel and guide to them in carrying out their program of altered intestinal hygiene.

⁂

William H. Daniel, M. D. (1930 Wilshire Boulevard, Los Angeles).—The history of chronic ulcerative colitis is one of prolonged medical treatment, with remissions and exacerbations. In cases in which medical treatment has no effect on the course of the disease, it is necessary to divert the fecal stream in order to allow the lesions in the colon a chance to heal. There is no doubt that in many of these cases the colon remains as a reservoir of infection which is inimical to the welfare of the patient, and this source of infection should be removed. There has been a tendency in the past few years to treat ulcerative lesions of the colon by ileostomy and colectomy. The operation is not without hazard because of this infection, and because the patient is in poor condition when the operation is attempted. Good results have been reported bv several authors. We are well aware of the fact that polyps form upon irritative lesions of the bowel and that these polyps are prone to undergo malignant degeneration. In the removal of the colon which is infected and predisposed to polyp formation, the possibility of cancer is eliminated. Doctors Delprat and Weeks have presented a very interesting discussion of the conditions which may result in colectomy. The case report that is here presented was complicated by regional ileitis, which made the operative procedure much more difficult. They are to be complimented upon the successful outcome of the four cases presented. This work should be a stimulus to further endeavor along the same lines.

MILIARY LESIONS OF THE LUNG, ROENTGENOGRAPHICALLY CONSIDERED*

By Ray A. Carter, M.D.
Los Angeles

Discussion *by Henry Snure, M.D., Los Angeles; Milton J. Geyman, M.D., Santa Barbara; M. L. Pindell, M.D., Los Angeles.*

MILIARY appearances on the roentgenogram of the lung are of grave importance. They most often represent either a rapidly fatal form of tuberculosis or a mild silicosis. They may be produced also by many less common diseases, benign or severe, which are often not even thought of, so strong is the tendency to diagnose tuberculosis. Such lesions are expected to appear as minute rounded spots of density on the film. We may consider the diseases which produce such lesions, the factors which influence their visibility and appearance on the roentgenogram, and the differential diagnosis so far as it is available.

Miliary pulmonary lesions may be defined as minute rounded densities up to three millimeters diameter disseminated more or less uniformly in both lungs. Strictly local involvements may be excluded for the present purpose. The common criteria of roentgen diagnosis are the size, density, discreteness, and distribution of the rounded miliary shadows themselves. Increasingly, attention is paid to a fine reticulum, or network of shadows, which may accompany the "miliary" spots. Nonmiliary telltale appearances on the film and associated clinical findings are also used.

Autopsies show us that miliary lesions may fail to register on the film and that their manifestations vary from case to case, as well as from disease to disease. The reasons for this are to be sought in the pathology present, the degree of aëration of the lung, the quality of the film, and the physical laws involved in depicting densities by means of the roentgen ray.

SUMMATION OF SHADOWS

The effect of summation of shadows on the visibility and appearance of structures of miliary size has been much discussed in recent literature. One may cite the work of H. Franke,[1] Heckmann and Barth,[2] and Heckmann,[3] and summarize such effects as follows:

1. Minute foci, like miliary tubercles, are of too low physical density to record singly on the film, and do so only by summation of the shadows of several or many such overlying lesions. If the lesions are too few, there is inadequate summation and no image; if too profuse, the shadows may merge into an almost structureless haze.

2. Such reinforcement cannot be produced by a uniform overlying density, such as the soft tissues of the thoracic wall, but requires structures themselves irregular in density. Deeper layers of miliary foci, and even the normal bronchovascular structures will serve. Heckmann and Barth[2] accomplished this experimentally, using the reticular structure of a piece of zweiback.

3. Miliary lesions, so reinforced, do not appear solely as rounded densities, but in part as a fine-meshed net, or reticulum. Further, the faint normal reticulum of the lung is, itself, a summation of the overlying fine interstitial pulmonary structures.

4. Uniform filtering by overlying soft tissues may aid summation indirectly by decreasing the general film blackness from one too intense for differentiation of slight variations in density to one so reduced that the eye can detect them. Conversely, it may carry the density too low for visualization. Thus the breast shadow may either bring out or obscure a miliary appearance locally.

5. The nodules seen by summation are usually those of a relatively thin layer nearest the film. The others add little to the apparent number, and exhaust themselves in reinforcing those seen. Thus, the real number of foci is far greater than the apparent.

6. The above summations are real images, since they represent actual structures in line with the images on the film. There are also unreal images dependent upon the fact that the focal spot of the x-ray tube is broader than the miliary lesion itself. This causes the direct shadow cast by the lesion to be a slender cone, apex toward the film, called by Bronkhorst the "Kernschatten."[2] If the lesion is so far from the film that this direct shadow does not reach it, a less dense spreading shadow, the "Pseudokernschatten," extends onward to reach the film. This is surrounded by a still vaguer halo, the "Halbschatten." Sufficient of these indefinite shadows may intersect by chance to produce miliary shadows, which represent no real underlying foci, and are termed by Heckmann[3] unreal images.

7. The direct shadows, for physical reasons not detailed here, are smaller in diameter than their

---

* Read before the Radiology Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9–12, 1938.

geometric projection would indicate, and the harder the ray the narrower the shadow cast. This explains how the same bronchovascular detail appears coarse on low kilovoltage films, slender and wiry on high kilovoltage ones.

These are basic reasons why miliary lesions produce such variable proportions of fine nodulations and reticula on the film. Under the terms "mottling," "granular density," "flaking," etc., we translate such appearances into a diagnosis of miliary involvement. Also, we see the lesions are not represented accurately as to size, number, or location. Stereoscopy helps little because the shifted focal spot of the tube changes the summations. Much that is far off the film is lost, even small cavities and confluent lesions. Snure and Maner [4] have described a comparable loss of detail in bone. The smaller apices with less summation appear poorly seeded though the insemination is uniform. Diagnosis based upon the size, density, discreteness or number of miliary spots, or on the presence, absence or character of a reticulum, must be made with caution, particularly as to associated interstitial fibrosis.

OTHER FACTORS

Air contrast provided by surrounding alveolar air is a factor, as discussed by Rappaport.[5] Detail is lost by either overaëration or underaëration. The normal adult lung in full inspiration appears to provide the optimum condition for fine delineation. The low air contrast of the normal infant lung and the high aëration of emphysema both diminish it.

Technical considerations are important. The miliary appearance may be obscured by movement, over or underexposure, excessive or insufficient contrast, an overlarge focal spot in the x-ray tube, inadequate tube-film distance, coarse-grained intensifying screens, poor screen contact, or improper darkroom handling. The portable film is particularly inadequate.

The histologic composition of the lesion was considered by Heckmann and Barth [2] to have no effect on the appearance of miliary lesions. Steiner [6] found that his cases of miliary tuberculosis having epithelioid tubercles failed to record on the film, while calcification or caseation added sharply to their visibility. Dunham and Skavlem [7] rated serous exudate, cellular exudate, fibrosis, caseation, and calcification, as progressive orders of density. Neoplastic nodes in the lung are of soft density, though sharply circumscribed.

SPECIAL DISEASES

Miliary tuberculosis was surveyed for the above points in fifty-nine autopsied cases. Twenty-nine cases were juveniles, the great majority in the first five years; thirty were adults, the majority under forty; while a few were of advanced age.

No nodulation was seen on the films of eleven juveniles and six adults. No abnormal reticulum was evident in nine juveniles and four adults. These findings so coincided that, roughly, 30 per cent of juveniles and 17 per cent adults had no direct demonstration of their miliary lesions. A few of these had seedings too sparse for summation. A few portable, or otherwise substandard films, were not calculated to reveal minute detail. Most had heavy inseminations and reasonably adequate films. Some had a vague blurriness or ground-glass appearance, which might be considered, at most, suggestive. The negative film does not exclude the disease.

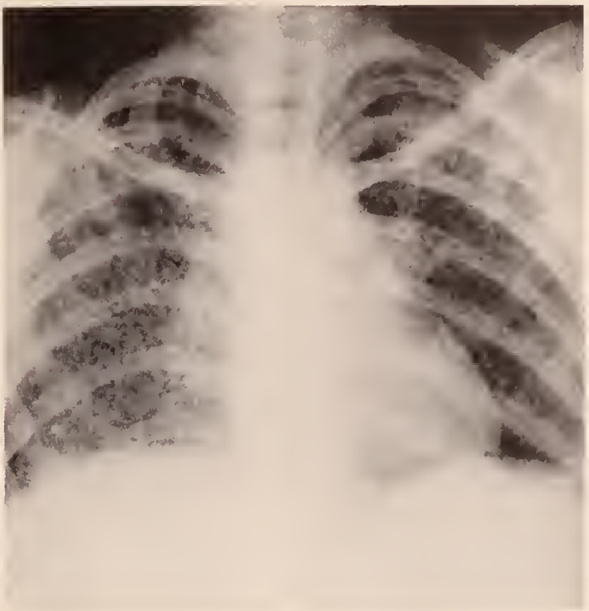

Fig. 1.—Coarse miliary tuberculosis in a child of thirteen. Nodular predominance. Obscure confluent lesions and cavities at the apices. Normal air-contrast and expansion.

Those showing real evidence of miliary involvement had varying proportions of nodular and reticular shadows. One only appeared almost wholly reticular, one almost wholly nodular. Juveniles had, on the whole, more nodular manifestations, adults more reticular. Nodulation might predominate in one part of the lung field, reticulation in another. Films viewed at some distance appeared more nodular, at reading distance they seemed more reticular. A "reticulum" was accepted only when definitely abnormally profuse. The reticulum tended to correspond to the nodules in coarseness.

There is, necessarily, a large personal factor in analyzing the characteristics of the nodulations. Our impressions were as follows. The radiographic density was low in most juveniles, high in a few. It averaged from moderate to high in the adults. Discreteness, or sharpness of outlining, was moderate to low. The size was almost evenly divided between fine (one to two millimeters diameter) and coarse (three millimeters diameter). The average profuseness of seeding was much higher than in comparable diseases. The distribution was uniform throughout the lung fields in the great majority. There were local accentuations in a few. One only was truly localized.

It was attempted to judge the air contrast by the blackening immediately about the lesions, ignoring the general impression of low contrast due to the profuse seeding. This contrast was normal in a great majority. A few had undercontrast with pleural thickening or scant fluid exudate. A few juveniles had overcontrast with seeding sufficiently profuse to imply a significant loss of respiratory

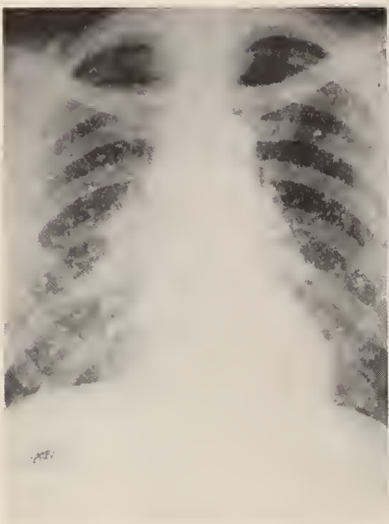

Fig. 2

Fig. 2.—Nodular silicosis with reticulation. Increased air contrast and overexpansion. Basal emphysema.

Fig. 3.—Sparse miliary calcifications. Calcification of hilar and peritracheal glands. No respiratory symptoms or tuberculous history.

Fig. 4.—Miliary carcinomatosis of bronchogenic origin. Right, basal fluid. Coarse reticulation predominates over the nodular appearances.

capacity. Pulmonary expansion corresponded to the air contrast.

Associated nonmiliary tuberculous lesions were evident in almost half the lungs. Hilar adenopathy, usually calcareous, was seen in 20 per cent of adults, and in over half of the juveniles, usually with enlargement. Enlargement of paratracheal glands was seen in 73 per cent of juveniles; paratracheal adenitis, usually calcareous, in 27 per cent of adults.

To correlate these findings: the average nodular manifestation was a uniform profuse seeding of low density and moderate to low discreteness, registering fairly clearly on a background of normal air contrast, by stippling so fine that a nodule three millimeters in diameter was coarse (Fig. 1). The smaller lesions were on the whole more profuse. These fine uniform inseminations on a background of normal or low air contrast appear unlike comparable diseases and quite characteristic, and were about half the series. Adding to these the paratracheal glandular enlargements of children and nonmiliary tuberculous appearances, the great majority would be considered tuberculous except by a real clinical discrepancy.

A minority of adults, having sparser, coarser seeding without other characteristic parenchymal lesions, have films most resembling other miliary diseases.

This series did not support the conception that acute generalized miliary tuberculosis is associated with fine profuse seeding, and less acute pulmonary involvement with the coarser lesions. Coarser lesions were seen in the acute generalized form. Very fine stippling might remain unenlarged for weeks or months. Particularly in children, small cavities, small acute "Ghons," or other small confluent lesions were often not visible, apparently lost in the miliary summations.

Chronic miliary tuberculosis, or granulie froide, occasionally occurs. It is seen, according to Saye,[8] most frequently between the ages of eighteen and thirty. It has remained quiescent as long as eleven years. It may end in resolution or in more acute disease. Minor symptoms, the miliary appearance with associated nonmiliary lesions, and enlarged paratracheal glands, may suggest the disease.

Miliary calcifications are usually thought to be healed miliary tuberculosis. Calcium metastasis has been considered. Sayers and Meriwether[9] reported 125 cases, mostly without clinical disease. They found Aspergillus in all sputa examined, but drew no final conclusion as to the origin of the involvement. The calcific seeding is so very sparse that healing would not be remarkable even though the lesions were tuberculous. The miliary calcifications are unmistakable roentgenographically, whatever their origin (Fig. 2).

Nodular silicosis may simulate miliary tuberculosis of coarse type (Fig. 3). By the time definite nodules or a sharp reticulum appears, there is usually an increased air contrast and early overexpansion of the lung unusual in tuberculosis. The bases and apices are relatively clear. The larger bronchovascular structures and hila are more thickened. The silicotic nodule is described as sharply discrete and dense. This may be partly due to heightened air contrast rather than to the intrinsic density of the nodule itself. Early silicosis may show an exceedingly fine nodulation and a reticulum more like that of fine miliary tuberculosis. Increased contrast and expansion have helped in differentiation. History is essential. In view of the known reticular summation effects, inferences of interstitial fibrosis must be made cautiously even though this is an essential part of the pathology of the disease. Silicosis also varies in manifestations from case to case. Pancoast and Pendergrass[10] comment that those seeing silicosis predominantly from one industrial source may be confused in encountering cases having a different type of silica exposure.

Silicosis with tuberculosis is usually identified by the character of the more massive nonmiliary manifestations of the two diseases. The determination from the film of how far either disease is responsible for the miliary lesions themselves is a severe and often impossible roentgen problem. Nodules with a discrete center and hazy border, extension of nodules to the apex, and lesions radiographically more advanced than the clinical disease would indicate, suggest a combined lesion.[11] Decisions in this field require close study of history and of the progress of the disease, and wide experience.

Miliary carcinomatosis may occur as metastasis from either bronchogenic or distant carcinoma. We may exclude cases in which larger nodes are scattered among those truly miliary. These larger nodes, circumscribed but not dense, are inconsistent with tuberculosis or silicosis. Those having uniform, coarse miliary nodulation may resemble either disease, particularly the coarser type of miliary tuberculosis (Fig. 4). Associated severe illness heightens the resemblance. Some of our cases have had an accompanying coarse hazy reticulum. Others have appeared almost purely nodular. The involvement tends to be basally accentuated. Hilar or mediastinal mass, atelectasis, suggestive symptoms, or a known distant primary may suggest the disease. Otherwise these cases have little to indicate their origin. Compared with nodular silicosis, the nodules are less dense and discrete, and are without surrounding increased air contrast.[12]

Coccidioidal granuloma has frequently shown profuse miliary involvement at autopsy. Usually this is represented on the film by a diffuse unorganized smearing of detail without discrete nodules or reticulum. One learns to infer the miliary involvement from this, knowing the disease to be present or seeing associated hilar and mediastinal glandular mass in the adult. Occasionally vague miliary nodulation is evident. Scattered cutaneous ulcers and/or scattered osseous lesions increase the chance of the disease in a region where it is frequently encountered. A terminal meningitis is common.

Other mycotic disease may cause miliary disease and the miliary appearance. Blastomycosis and torulosis among others may cause acute disease. Pencillium, Aspergillus, and others may produce more chronic illness.[13] It is more important to test the sputum for fungi than to attempt differentiation on the film. Terminal meningitis is common in acute mycoses and is not indicative of tuberculosis.

Miliary bronchopneumonia occasionally occurs. We have seen a few cases following measles in small children. The nodulation was coarse, uniformly distributed, hazy, sparser than the usual tuberculosis, and without evidence of hilar and paratracheal adenopathy. Post-measles miliary involvement should be given an opportunity to resolve before diagnosing it as tuberculosis, particularly in absence of adenopathy. We have seen a few adult miliary bronchopneumonias. Resolution within an appropriate period and the history made the diagnosis.

Miliary abscess of the lung in one of our cases produced a vague nodulation. Autopsy made the diagnosis.

Petechial pulmonary hemorrhage in infants producing a tuberculosis-like miliary appearance was reported by Anspach.[14] These patients had acute fatal ulcerative enteritis. Diagnosis will depend upon recognition of a clinical cause for such hemorrhage.

Periarteritis nodosa has been cited as a cause of miliary appearance.[15] This must occasionally occur, though most reported lesions appear to be of grosser type. Diagnosis depends upon prior recognition of the disease on clinical grounds.

General sarcoidosis may have miliary or larger pulmonary lesions. This or similar diseases under numerous names, such as Boeck's disease, Darier-Roussy's disease, lupus pernio, etc., may have epithelioid tubercles in almost any organ. There is considerable disagreement concerning their origin. Pinner [16] considers them tuberculous. Miliary or larger lesions are seen in the perihilar and adjacent regions of the film, not reaching to the periphery, and associated with hilar masses.[17, 18] Saacke [18] described an exceedingly fine reticular network in her case. These features, a benign course, and, if present, cutaneous nodules or cystic expanding lesions of bone, may permit recognition.

Incidental miliary appearances occur on the films of many normal chests, due to accidental miliary summations. They may be at the bifurcations of the fine vascular linear shadows, scattered sparsely, or in small clusters. Miliary disease should not be lightly assumed from such minor manifestations.

COMMENT

The miliary appearance is most frequently due to tuberculosis or nodular silicosis, occasionally to miliary carcinomatosis. Other occasional pathologic causes are so numerous that complete listing is almost impossible. Many are so rare that roentgen differentiation cannot be attempted. Even in the common ones, diagnosis from the film should be made with cautious regard for the limitations imposed by the similarity of different diseases, the variations in appearance in any one disease, and the vagaries of summation effects. History is essential. When inconsistency of symptoms or history arise, there are numerous possibilities requiring exhaustive use of all clinical and laboratory aids. Often the progress of the disease provides the clue.

DISCUSSION

Henry Snure, M. D. (1414 South Hope Street, Los Angeles).—Doctor Carter rightly stresses the vagaries of summation effects in his comments. Summation effects were known shortly after the discovery of the roentgen ray; but frequently they are forgotten or ignored. Particularly is this true of soft tissue densities. This is in spite of the fact that it is common knowledge that, while many small gall-stone shadows can be counted on a film, the actual number of stones found at operation is usually four or more times greater.

The soft miliary densities of tuberculosis visualized on the film constitute only a small percentage of the miliary lesions present. Some lesions will be too small to be visualized on the films under any circumstances. I recall three cousins, dying of miliary tuberculosis within a few days of each other, where I had an opportunity to study the lungs in varying degrees of inflation at autopsy, and no changes were noted on the film. These miliary lesions were about a millimeter in diameter and were easily seen macroscopically.

Today, with our fine focus rotating anode tubes, fine-grain screens and faster non-screen films, a larger percentage of these cases of miliary tuberculosis are being diagnosed. We shall always have a large personal factor to contend with in interpreting fine miliary shadows or linear markings on the film, as pointed out by Doctor Carter. One man may refer to a slight accentuation of linear markings as stage one of silicosis, while the other man may refer to it as "the stage of imagination." When one attempts to compare a series of chest films made at different institutions with different voltages, and in various stages of respiration, and perhaps with a few portable films thrown in for good measure, one realizes that illusions may not be confined to the mentally deficient alone. When the history and clinical findings do not corroborate the x-ray findings, it is best to minimize the x-ray findings.

⁂

Milton J. Geyman, M. D. (Cottage Hospital, Santa Barbara).—Doctor Carter has so thoroughly covered the subject of miliary lesions that further discussion seems superfluous. However, I should like briefly to mention two less commonly seen miliary pulmonary diseases.

While in Stockholm last year, an assistant of Lysholm, at the Royal Seraphimer Hospital, showed me an interesting group of cases of a condition which they called lymphogranuloma benignum, known here as Boeck's disease, or pulmonary sarcoid. The roentgen picture of these cases varies considerably as to the number, size, and distribution of the lesions. All of them show some degree of hilar adenopathy. The lesions in most cases show a tendency to disappear under treatment, their results being better with arsenic than with roentgen therapy.

Another lung involvement resembling miliary tuberculosis is seen in certain epidemics of measles. These lung changes disappear within eight or ten days. An embarrassing error may be avoided if this similarity is kept in mind.

I should like also to stress Doctor Carter's remarks as to technical considerations. The slightest deviation from accurate technique will preclude visualization of some miliary pulmonary diseases, and perfect films are a primary requisite in the study of obscure pulmonary conditions.

⁂

M. L. Pindell, M. D. (670 South Ferris Avenue, Los Angeles).—This is a very timely subject, and is discussed by Doctor Carter in his usual thorough manner. Miliary type of deposits in the lungs have caused me considerable trouble and embarrassment. Not long ago I was asked to render an opinion on a film taken of a ten-year-old girl in the hospital. It was the usual miliary seeding throughout both lung fields that we so commonly see in miliary tuberculosis. She was running a high temperature, and I told her uncle, a physician, that she undoubtedly had miliary tuberculosis and would probably die within a few days. In less than a week this little girl was perfectly well—and did my face get red. She apparently had a bronchopneumonia.

As Doctor Carter states, "the negative film does not exclude the disease." About two years ago a film was taken in our department of a seventeen-year-old female, and was reported as negative. In three weeks this patient died in the General Hospital of miliary tuberculosis. A film taken two days before death showed miliary dissemination with typical summation effect. Epithelioid tubercles may have been present when the first film was taken, as the patient was at that time quite ill.

I am glad Doctor Carter has stressed the technical difficulties involved. In addition to a regular postanterior view, an anteroposterior film is sometimes helpful. Doctor Carter's plea for exhaustive clinical aid should be heeded.

SUICIDE[*]

By F. G. Lindemulder, M.D.
and
F. E. Toomey, M.D.
San Diego

SUICIDE has been both condoned and condemned since earliest times. Only since the birth of modern psychiatry have any comprehensive attempts at its prevention been made. Nevertheless, self-destruction is not decreasing. Because San Diego County has the unenviable reputation of having one of the highest suicide rates in the country, a statistical study of its 533 cases occurring in the seven-year period between 1931 and 1938 has been made in the hope that its findings might shed some light on the causes and possible prevention of suicide.

We feel that the number of unsuccessful attempts far exceeds the actual number of suicides, although there are no accurate figures on this point. Our cases include all of those in which suicide was the probable cause of death. All unsuccessful attempts and undoubtedly many cases of indirect

suicide, without the active participation of the individual, which Menninger[1] has described, are excluded.

FACTUAL DATA IN TABLES

The methods of self-destruction are shown in Table 1. Shooting accounted for the greatest number—203—and asphyxiation for the next largest number—144. Gas was the means of asphyxiation in ninety-three cases and hanging in fifty-one cases. This order of frequency of method conforms with the figures of the United States as a whole, but is the reverse of the findings of Lendrum[2] in his study of one thousand unsuccessful suicide attempts. Also, in our as in other series of successful suicides, the number of male victims far exceeds the number of females (Table 3), whereas in Lendrum's study of unsuccessful attempts there were twice as many females as males. The fact that males predominate in the successful attempts may be due to the fact that they are more apt to choose firearms, in which they are more or less proficient, as a means. Drowning was fifth in the list of methods, an interesting observation in view of San Diego's location and resultant accessibility to water.

The apparent causes of suicide are given in Table 2. Ninety-five of these victims were known to have definite psychoses; 231 were despondent, and in 164 of these ill health was given as the cause of the despondency. Our list of causes includes many reasons given in death notes, such as financial difficulties, marital troubles, unemployment, etc., in addition to factors which might have played important rôles, such as mental illness. Many of these obviously played a minor environmental rôle, but all show social maladjustment. Mühl,[3] after reviewing five hundred cases of suicide in San Diego in 1927, felt that feelings of failure and frustration were always factors in suicide.

TABLE 2.—*Suicide—San Diego County, California: For Period 1931-1937 Inclusive As to Causes*

The tabulation of the marital status in our series showed that more than twice as many were married as were single—274 against 110 (Table 3). Lendrum[2] found that divorce, at least among females, was a predisposing factor in unsuccessful attempts. Our figures show that thirty-six individuals were divorced and fifty-nine were widowed.

An interesting fact to note was that, whereas there were 105 different occupations represented, the majority of the suicides were among those whose employment was of a sedentary nature, such as that of housewives, retired individuals, etc. Could this be because the occupation was not suited to their needs and personality; that they were deprived of means of self-expression? The fact that even in times of depression, suicide rates in general are lowest among priests, monks, and those having out-of-doors occupations, is significant.

Only forty-two of our entire series were native Californians; from ten to twenty years was the length of residence in California of the greatest number. This is an interesting observation, even in the face of the fact that San Diego's population as a whole includes many people, both young and old, from many other states and countries. Again our figures bear out the findings of other observers that suicide is more frequent among northern European and Germanic races than among the southern European.[4] Our greatest number of foreign-born suicides was among the Germans. Our series included no individuals below ten years of age. The greatest number occurred in the fifth decade of life and the next largest number in the sixth decade. Perhaps at this age the realization that their dreams of a successful life had not materialized, made life seem no longer worth living. Or was it that these people had reached their climacteric?

A study of suicides for one year might seem to show a definite seasonal variation, but a several-year review reveals such a conclusion as a fallacy. Over our seven-year period, December had the lowest number—thirty-two—and January and July the highest, with fifty each. The distribution throughout the year over this seven-year period showed little variation. (Table 5.)

QUERIES

Is San Diego's high suicide rate due to its geographic location, the extreme southwestern area of

the United States; to its equable climate, its sunshine, and high fogs; or to its large population of individuals who have come West because of ill health or because of a migrant nature, which does not permit them to adjust themselves to their environment?

Mühl[3] has given an interesting explanation of San Diego's high suicide rate in the symbolic significance of the Southwest and the attraction by the regression which it typifies, of the regressive. Mills[5] attempts to show that the suicide rate, like the morbidity rate, is influenced by various climatic factors. Although he concedes that "much of the storm effect probably works through increasing the tempo of life and economic competition," he concludes that "there probably remains a distinct disturbing action of the storm changes as they affect the body directly." However, San Diego's climate is one of the most equable in the country and is singularly free from storm changes. Whether or not more suicides occur during periods of high humidity or of certain barometric pressure levels, under the influence of storm conditions about us, our statistics do not show. Such a comparison might give us added information. On the other hand, perhaps the very equability of the climate with its enervating effect is in itself a factor.

The most logical and simple explanation of San Diego's high suicide rate seems to us to be found in the fact that a majority of the victims come to us from elsewhere. These people did not find the Utopia they expected and they were as unable to adjust themselves to their environment and circumstances here as they had been elsewhere.

AUTHORS' ANALYSIS

Our analysis of San Diego's suicide figures has perhaps shown us why its rate is higher than that of many other places in the United States. But it has added little to our understanding of suicide from a psychiatric point of view. It confirms the general opinion, especially that of the layman, that illness and feelings of failure and frustration play an active, inciting rôle; but if, with Lewis,[6] we believe that we should not assume the absence of a psychosis in any case of suicide even though there has been no evidence of frank mental disorder, and that the apparent causes are merely secondary influences, we must turn to psychiatry for the explanation and suggestion for treatment.

FREUD'S OBSERVATIONS

Freud has observed that there are two dominant tendencies in life: the instinct to self-preservation and the instinct to self-destruction. Lewis[6] carries the tenacity of the self-preservation instinct into the biological field when he says that "the many organic, including the vegetative processes of the body, judging from their struggles to maintain life after suicide becomes 'unconscious,' in general do not want to die any more than they do in organic disease situations where one part had regressed to the destructive breaking point." Self-destruction, on the other hand, is explained by the psychoanalysis school as a form of inverted sadism in which the individual who suffers from feelings of guilt and hate looks upon himself as the worst type of culprit or sinner. His attempts at violence on himself represent his feelings of the need of punishment.

ON THERAPY

Psychiatric treatment of the potential or attempted suicide victim deals with the correction of

the disturbing factor in the psychic and somatic realm, or in the patient's environment. Careful study through psychoanalysis, and this, as Lewis[6] has stated, should be directed more toward the bioanalytic fields, is needed. Since the individual directs toward himself the feelings that should be directed toward others—"narcissistic regression" is the term used by Jamieson and Wall[7]—"the aggression which might be lived out upon the external world (or another person) is blocked."[7] Many suicides may be delayed or prevented by a transference of the patient's suicidal motive to a thought or individual from which he may gain comfort or a sense of security. Withdrawal of this crutch, either voluntarily or involuntarily, may throw the patient back to his original intent, but the gradual substitution of a hobby or some other interest for this support may push this intent far enough into the background to make it an ineffective force in the patient's life. In any event, self-destruction may be indefinitely postponed. We believe that such transference forms the fundamental basis of treatment of these cases.

CONCLUSIONS

An analysis of the suicide figures of the past seven years for San Diego County conforms with similar analyses made in other localities and for the United States as a whole. The high rate of suicide in San Diego County seems to be due to the large number of migrant individuals who come here from elsewhere and find themselves no better able to adjust themselves to circumstances in San Diego than they had been in their original homes.

Since, psychiatrically speaking, suicide seems to be a result of a directing inward, rather than a directing outward, of the victim's psyche, a change in the individual's interests to outward-pointing media, by transference, would seem to be the fundamental step in the prevention of potential or attempted suicide.

AUSCULTATION OF THE ABDOMEN*

By John Homer Woolsey, M. D.
Woodland

Discussion *by Frank E. Wiebe, M. D., Salinas; John C. Ruddock, M. D., Los Angeles; H. Brodie Stephens, M. D., San Francisco.*

AUSCULTATION of the abdomen has been practiced too imperfectly and especially too irregularly up to the present, to be esteemed at its just value. It deserves an important place among the methods of examination, and has the advantage of being put into practice immediately at the bed of the patient with the aid only of the stethoscope. It is not intended that auscultation of the abdomen alone will establish the diagnosis, but that, employed in adjunct to our other means of examination, it will give additional pertinent information and at an earlier stage. This method is of especial value in the differential diagnosis of traumatism of the abdominal region, in following the evolution of acute abdominal disease, the evolution of the postoperative course, and formulating their prognosis.

In auscultation of the abdomen there are the variations in the transmission of extrinsic sounds that some, such as Claybrook,[1] Aschner[2] and others, believe are of value; some adventitious sounds, such as peritoneal friction in plastic peritonitis, tinkling of fluids with change of position in ascites, etc., that are rare and of questionable value; and the murmurs from normal peristalsis and modifications of it, chiefly a peristalsis and hyperperistalsis. This paper will deal only with those sounds relating to peristalsis, entering into a discussion of the anatomical background, the phylogenetic cause for the reflexes as they are, the findings as noted in the normal, in the postoperative period, and in the acute abdomen, and the interpretations of these findings.

ANATOMY AND PHYSIOLOGY

The gastro-intestinal tract has been shown by Bayliss and Starling,[3] Cannon,[4,5] Alvarez[6] and others, to be to a large extent autonomous. That is, it has within itself the mechanism essential to peristalsis.

The smooth muscle alone of the gastro-intestinal wall has the power of rhythmic contractions, as witness what happens when a single strip of such muscle, free from all nerve elements, is placed in a proper salt bath. It is necessary, however, to have coördination of these muscle contractions if an orderly sequential progressive action in the gastro-intestinal muscle tube is to be obtained.

The myenteric neuroplexus (Auerbach's), located between the longitudinal and circular intestinal muscle layers, serves for the conduction of the stimuli and the coördination of the peristaltic muscle movements. The myenteric plexus has, in addition, an inhibitive control upon the forceful muscle contractions, preventing thereby local muscle spasms or prolonged regional contractures from occurring. The submucous neuroplexus (Meissner's) located in the submucosa, has to do with reception of stimuli from within the bowel, and the conduction of those impulses to the coördinating myenteric plexus.

To summarize, the smooth muscle has the inherent power of rhythmic contraction; the submucosal plexus receives stimuli from within the bowel, and conducts impulses to the myenteric plexus, and the myenteric plexus conducts stimuli for inhibition of muscle contraction, and coördinates the muscle contractions to give thereby the waves of peristalsis.

The extrinsic nerve associations are through the sympathetic system, arising in the celiac superior plexus and passing to the intestine as the splanchnic nerves, and the parasympathetic arising in the cranial and sacral branches and passing to the intestine as the vagus and sacral nerves. Both sets of nerves pass along the mesenteric vessels, the sympathetic in the subserous coat of the blood vessel and then becoming associated with the muscle directly, while the parasympathetic branches connect directly with the myenteric plexus.

The sympathetic nervous system has an inhibiting effect, slowing the peristalsis and giving relaxation to the intestinal wall. The parasympathetic, on the other hand, has a stimulating effect. The neuro-arcs, through which the stimuli may be carried, giving a reflex action, are not definitely known. Kuntz[7] says "reflexes, mediated through the extrinsic nerves, play only a minor rôle in the control of intestinal activity, yet reflex inhibition of the movements of the small intestine may be brought about by stimulation of any afferent nerve. The reflexes involved are mediated through centers in the medulla and spinal cord, and are carried out through the splanchnic nerves. Inhibition is the only effect on the small intestine which can be brought about by stimulation of afferent nerves." He states further: "Gastro-intestinal motility of certain types probably is myogenic. Whether gastro-intestinal motility of certain other types is initiated in the enteric nervous system or in the enteric musculature must at present be regarded as an open question. Certain reactions, which are commonly recognized as reflexes, are quite certainly initiated in the enteric nervous system and carried out through it."

REFLEXES

On what are our body reflexes based? The theory that the experiences of the human race, from the very origin to the present, has developed certain reflexes of defense for the survival of the race, seems tenable. As Crile[8] has said, every adequate stimulus awakens an ontogenetic (his own personal experience), and phylogenetic (experience of his progenitors) memory or association, and the nerve mechanism evolved makes an appropriate response. Each part of the body has developed specific reactions; for example, burning of the end of the finger stimulates immediate withdrawal; a foreign body in the nostril stimulates a sneeze reflex; a foreign body in the larynx stimulates a cough reflex; and in a like manner the peritoneum, from phylogenetic experiences, has certain inherent reflexes of defense.

---

* Read before the General Surgery Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9–12, 1938.

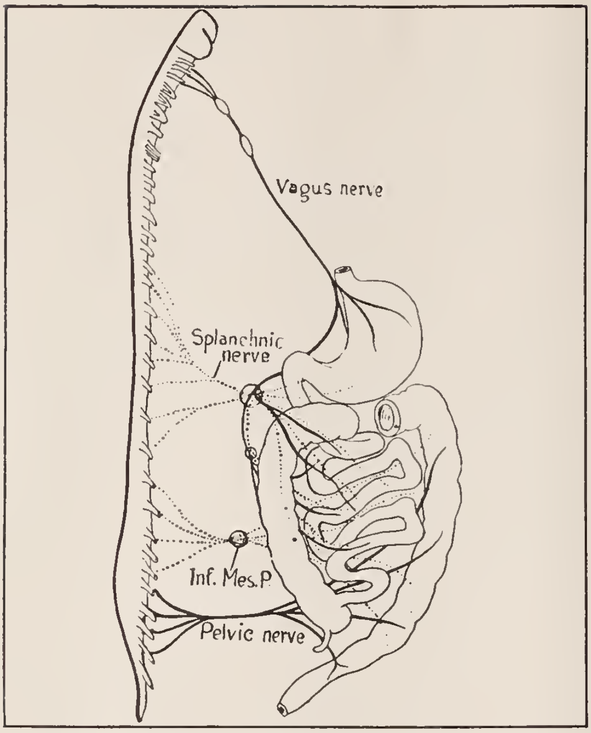

Fig. 1.—Diagram illustrating the distribution of sympathetic and parasympathetic nerves to the stomach and intestine. (Kuntz.)

The reflexes of defense on the part of the abdominal viscera and peritoneum are conditioned, as the others, on adaptation to the past environmental experience, when "man had to fight or flee." Therefore, we see these reflexes conditioned as to response, but not as to cause. The peritoneum has been endowed with powers to resist and overcome any harmful interference, such as trauma or infection, by localization. This is accomplished by reflex action where the abdominal wall is held still and rigid, the diaphragm held immobile, and the intestinal wall held still and rigid by a local inhibition of muscle contractions and intestinal distention. Now, whereas the invasion by infection or the incident of an open traumatic wound of the peritoneal cavity, or a perforation of an intra-abdominal viscus, originally was the stimulus to reaction, today modern aseptic surgery with the handling, the more or less chilling, or the use of chemicals of and upon the abdominal viscera and peritoneum, obtains the same response.

To recapitulate, there are definite defense reflexes of the peritoneum and abdominal viscera developed from phylogeny, not conditioned as to cause, but definite in response and characterized by immobilization in order to obtain localization.

One may go further and observe that, from stimuli within the gastro-intestinal tract, certain reflexes of defense for the same phylogenetic reason apparently occur, namely, any gastro-intestinal irritant, as a purge or poison, will stimulate more or less violent peristalsis in order to eliminate it. If an obstruction of the gastro-intestinal tract occurs, then a violent peristaltic action is set up. On the other hand, a foreign body in the gastro-intestinal tract will, if it tends to penetrate into the peritoneal cavity, be followed by a local quietude of that portion of bowel.

Therefore, the presence of a normal peristalsis or variation from it has a definite significance, and if by some study, such as auscultation of the abdomen, one can say as to the state of peristalsis, then more definite conclusions as to diagnosis and prognosis should follow.

PERISTALTIC SOUNDS

The peristaltic sounds as heard by the stethoscope are divided into three states:[9] (1) the state of normal peristalsis; (2) the state of aperistalsis, quietude, or absence of peristalsis; and (3) the state of abnormal or hyperperistalsis, or "rush peristalsis."

The state of normal peristalsis is recognized by the presence of normal intestinal segmental or mixing movements, myogenic in origin, characterized by soft purring, low-pitched gentle sounds, quite generally distributed over the entire abdomen, but best heard in the right lower quadrant, and more or less constant in action, dependent upon the degree of stimulation from the gastro-intestinal content. For example, after the taking of food, very active segmental motions are present for one to two hours; while, on the other hand, during the period of sleep some six hours posteating, only an occasional sound significant of motion is heard. There is also in this stage the normal peristaltic progressive movement characterized by a medium long higher-pitched gurgle, to a rumble, with occasional tinkles and gentle, squirting noises occurring at quite regular rate, and as frequently as once at least every three minutes.

The state of aperistalsis, quietude or absence of peristalsis, is as the terms denote. It is usually not complete, but may be so for brief periods dependent upon the exciting cause and its extent. One should always listen, however, for three minutes before concluding that there is a silent abdomen. It occurs definitely by an intrinsic reflex involving the peritoneum and the smooth muscle of the gastro-intestinal tract through the myenteric plexus, but may also occur through the extrinsic reflex arc. Aperistalsis is seen after abdominal surgery ordinarily up to twenty-four hours, dependent upon the degree of trauma, rough handling, chilling of tissue abnormally, injury from irritating solutions, etc., that may occur; in any instance, accompanied by irritation of the peritoneum, as peritonitis, intraperitoneal hemorrhage, intraperitoneal leakage from the gastro-intestinal tract, urinary tract or biliary tract; pancreatitis with intraperitoneal involvement and traumatic wounds rupturing into the peritoneal cavity.

Aperistalsis, on the basis of extrinsic causes, is thought to occur through a reflex that passes afferently via the splanchnics. Such extrinsic causes are postperitoneal hemorrhage; trauma, as traction or blows in the region of the solar plexus; sudden and permanent hyperextension of the spine in a body cast; sudden release of an accustomed, intra-abdominal pressure, as post-cesarean section or removal of a large intra-abdominal tumor; a crushing injury of the testis or a strangulation of the spermatic cord; torsion of an ovarian pedicle; injuries of the spine; and occasionally with ureteral calculus or subsequent to ureteral and kidney studies by cystoscopic examination.

A word should be said here as to the term "paralytic ileus." It is a term "ill chosen,"[10] probably never occurs, and is a relic term of the time when auscultation of the gastro-intestinal tract was not made. Inhibition of peristalsis or "splinting" of the bowels is the proper term, and is what actually occurs.

Abnormal peristalsis occurs in such conditions where intra-intestinal irritation is present, as from purges, ingested irritable material, poisons or foreign bodies; an intestinal obstruction from any cause; in intragastro-intestinal hemorrhage; occasionally in instances of achylia gastrica; normally in individuals of the hypertonic or vagotonic type; often accompanying the bite of the black spider; following the intravenous administration of hypertonic sodium chlorid solution; following the use of smooth muscle stimuli, as pitressin; and in instances of spinal anesthesia, where paralysis of the splanchnic nerves (sympathetic system) is obtained.

The sounds of hyperperistalsis are characterized by loud gutteral to high-pitched tones, squeaks, booms and hissing, musical sounds varying in degree, intensity and frequency, dependent upon the intestinal content of fluid and air and the cause of the irritation. For example, an acute intestinal obstruction gives at first a very vigorous hyperactive rapid peristalsis, and later, as the bowel becomes distended and fatigued, an infrequent sluggish peristalsis.

INTERPRETATION

Auscultation of the abdomen is of special value in peritonitis, acute abdominal conditions such as appendicitis, perforations of visci, intraperitoneal hemorrhage, intestinal obstruction, in differentiation in cases of traumatism about the abdomen, flanks, lumbar, and pelvic regions as to the presence or not of intraperitoneal injury, and of inestimable value in observation of the progress of the postoperative period.

In instances of irritation of the peritoneum, according to the reflexes of defense, one finds by auscultation a decrease to cessation of peristalsis. In peritonitis; appendicitis when there is neighborhood peritoneal involvement; in leakage from any viscus; from intraperitoneal hemorrhage or from external injury as an open wound, then immobilization of the intestine to protect occurs, and aperistalsis ensues. If there has been trauma in the vicinity of the abdomen, but no intraperitoneal injury, then peristalsis will be present. Active peristalsis under these circumstances would then be significant of no intraperitoneal injury and an exploratory celiotomy is avoided.

If, on the other hand, there is some intraintestinal irritant or an intestinal obstruction, then hyperperistalsis will be present. In intestinal obstruction, hyperperistalsis is at the start frequent, vigorous and loud, but at a later stage occurs at infrequent intervals, and is then of a lazy, slow, but loud type. Progressive movements are the type present, while segmental motions are usually absent.

Auscultation, in the postoperative course of an uncomplicated celiotomy, reveals most often only occasional peristaltic sounds up to twenty-four hours, and not infrequently no cessation of peristaltic sounds whatsoever. During this initial period of aperistalsis, fluids taken will remain in the upper gastro-intestinal tract and lead to gastric distention and regurgitation, and possibly vomiting. If, therefore, one listens and only when peristalsis has become relatively active, starts fluids by mouth, he will not have the frequent upper gastro-intestinal distress. Frequently enemata are given to relieve gas, believing there is some "paralytic ileus," whereas auscultation of the abdomen will usually reveal an active peristalsis and the enema as unnecessary. In addition, the enema frequently but temporarily upsets the returning smooth muscle coördination as well as the patient's morale, and besides creates unnecessary work for the nursing staff. Pitressin or other smooth muscle stimulants are given to provoke peristalsis when, if auscultation were employed, there would be revealed peristalsis already progressing satisfactorily and, therefore, no need for this whipping up of smooth muscle action guided by reflexes of phylogenetic development.

Auscultation of the abdomen gives us definite and earlier knowledge of the return of gastrointestinal function, when fluids and food by mouth may be started, and when the rectal tube to overcome anal sphincter tonicity is indicated. If there are complications occurring, as a local peritonitis or an unsuspected intestinal obstruction, then an inhibition of peristalsis or hyperperistalsis (as the case may be), will be present, the condition more promptly recognized, and the proper postoperative care adjusted.

REPORT OF CASES*

CASE 1.—W. C. H., No. 30781. This case is presented for the observance of a normal postoperative course. A female, age twenty-nine, with an apparent pregnancy of three months, accompanied by irregular cervical bleeding, "spotting," experienced, at two months, severe lower abdominal pain and an acute pelvic tenderness which persisted, although at a milder degree. Physical examination revealed a uterus of apparently two months' pregnancy, no uterine bleeding, and a retro-uterine firm, slightly tender, nonmobile mass filling the Douglas pouch. The Aschheim-Zondek test was positive at one and a half months of the pregnancy, and questionable at three months' period. The diagnosis was a tubal pregnancy complicated by probably nonviable fetus, and was so proved. Treatment consisted of celiotomy, left salpingectomy for an intratubal pregnancy, and appendectomy. There was no undue exposure of viscera. Recovery.

Comment.—This case record is illustrative of a celiotomy with considerable surgery and a smooth postoperative course. Twenty-four hours postoperatively there was beginning peristalsis, but not as frequent or sustained as normal, generally distributed, and unaccompanied by any nausea or vomiting. This signified that gastro-intestinal movements were present, and could carry gastro-intestinal content on to a partial degree only. Limited fluids were allowed, and during the next twelve hours the patient took by mouth 970 cubic centimeters. The second twenty-four hours was characterized by a decrease in peristaltic activity, and a coincidental occurrence of some nausea and slight distention. Fluids by mouth were, therefore, stopped and supplemented by intravenous glucose. The third twenty-four-hour period was characterized by a return to an active and normal peristalsis, no further nausea, and passage of flatus freely. This active peristalsis suggested that the "reflexes of defense" from whatever cause, presumably the trauma of surgery, were past. From then on the patient's convalescence was uneventful, peristalsis normal, and all fluids after the second day were taken entirely by mouth without distress.

---

* Only two of twelve case reports submitted with the author's paper are here given. Others will appear in the reprints.

Thus the observation of the presence and the type of peristalsis indicated when fluids could be taken by mouth, when they should be limited, and when they could again be started and continued.

* * *

Case 2.—W. C. H., No. 30780. This case is illustrative of an instance of peritonitis and the relation of peristalsis to this. A female, age twenty-two, experienced a gradual onset of a persistent, steady, nonradiating lower abdominal pain, worse with movement, accompanied by diarrhea at the start, vaginal discharge, marked general malaise, and nausea and vomiting. Physical examination revealed, at the start, lower abdominal general tenderness without any muscle guarding; bilateral pelvic masses with marked tenderness; and a temperature of 103 and pulse of 120. From the sixth to the tenth day there occurred some distention with lower abdominal muscle guarding. The final diagnosis, and so proved, was acute pelvic inflammatory disease with pelvic peritonitis. Treatment consisted of rest, Fowler position, ice bags to abdomen, long, hot vaginal douches, fluids intravenously and subcutaneously, especially during the sixth to tenth days of illness, celiotomy on the twenty-first day with bilateral salpingostomy and appendectomy. Recovery.

Comment.—Case 2 is illustrative of an occurrence of peritonitis and the corresponding defense reflexes. This patient's condition was considered to be an acute pelvic inflammatory disease and later, before surgery, as a probable pelvic appendicitis with abscess formation. At the start, for six days, there was active peristalsis, accompanied by no abdominal spasticity and only a low abdominal tenderness. Then the patient became more ill, had aperistalsis with accompanying moderate distention and tenderness of the lower abdomen. This condition continued for four days when, coincident with a return of peristalsis, to just over the pelvis, she showed general improvement and recession of the tenderness. By the twentieth day, postonset, normal peristalsis was well established and there was no further abdominal tenderness or spasticity, and only a remaining tender mass in the right pelvic adnexal region. Her temperature returned, likewise, to normal.

The peristalsis present and active during the first six days occurred while the findings were of an acute inflammatory process entirely limited to the pelvic cavity. On the sixth day, however, peristalsis suddenly ceased, and coincidentally there occurred abdominal distention, slight abdominal muscle guarding, and a general toxic state. This represents the occurrence of a spreading lower abdominal peritonitis, with demonstration of the defense reflex to wall off the spreading infection, namely, aperistalsis, distention and abdominal wall muscle rigidity. On the tenth day peristalsis began and, coincidentally, the abdominal distention decreased, the temperature lowered and the patient's general condition improved. This represents a conquering of the peritoneal invasion, no further stimulation of the defense reflexes, and a return to normal smooth muscle function.

The entire clinical course was followed by auscultation of the abdomen and treatment employed as indicated; that is, during the aperistaltic period fluids were withheld by mouth and given by the intravenous and subcutaneous methods, and a Levine gastric tube for gastric drainage employed for a brief period. When normal peristalsis returned, fluids, and later food, by mouth were gradually allowed.

Afterward the patient was operated upon, and the evidence found revealed the occurrence of a pelvic inflammatory disease with definite "walling off" by recent interintestinal and omental adhesions of the process to the pelvic cavity.

CONCLUSIONS

1. Auscultation of the abdomen is a method of examination of definite value and should be employed in adjunct to the other means of examination.

2. The presence and type of peristalsis, or the absence of peristalsis, is of significance in interpretation of any intraperitoneal irritation.

3. The inhibition of peristalsis is a reflex of defense on the part of the body to a peritoneal insult.

4. The application of the value of auscultation of the abdomen, as regards typical conditions directly or indirectly related to peritoneal injury, are given and discussed.

DISCUSSION

Frank E. Wiebe, M. D. (610 Salinas National Bank Building, Salinas).—Doctor Woolsey has, in his usual clear and direct way, presented to us the little-used method of abdominal examination. He has discussed the anatomy and physiology involved, and has pointed out the peritoneal reflex producing inhibition of peristalsis, this reflex being initiated by any irritation, which may be chemical, mechanical, or inflammatory.

Since it has been my privilege to review this paper previously, we have taken advantage of abdominal auscultation, both for diagnosis and for following our patients postoperatively. Our most unusual impressions have been in cases of acute appendicitis in which, as the author has stated, peristalsis is inhibited in the right lower quadrant, due to an inflammatory peritoneal reflex.

A case in which we felt the clinical and laboratory findings outweighed the findings of abdominal auscultation, and which was diagnosed as acute appendicitis, proved the value of this sign. A five-year-old child, ill about ten hours with abdominal pain localizing in the right lower quadrant with definite right lower quadrant tenderness and muscle protection and rebound tenderness. The white blood count of 20,000 with 82 per cent polymorphonuclears, but with peristalsis active over the entire abdomen including the right lower quadrant, was diagnosed as acute appendicitis. On operation, we found an appendix only slightly inflamed, but in the region of the terminal ileum were a number of large red glands.

Postoperatively, we have been impressed with the absence of distress in our patients since we have been permitting only minimal amounts of fluid by mouth until peristalsis had begun, food being withheld until peristalsis has become active.

I want to thank Doctor Woolsey for presenting this method, and feel that anyone who has not utilized it will find it a valuable addition to his method of examination.

⁂

John C. Ruddock, M. D. (1930 Wilshire Boulevard, Los Angeles).—The art of the practice of medicine which, in the absence of mechanical aids, was highly developed in our forebears, has been sadly neglected. Much dependence and finality is placed upon the findings of the roentgenologist, the hematologist, the chemist, and the bacteriologist to make the diagnosis. The five senses of man have been relegated to a minor position. Doctor Woolsey has called our attention again, and pointed out the value in diagnosis and the determination of course of treatment on the simple procedure of auscultation of the abdomen. No expensive equipment is necessary. No time is involved in the interpretation or decision. Every doctor has a stethoscope and is trained in its use. Interpretation of the intra-abdominal pathology is dependent on the physiological response to the reflex stimulated by the lesion, *i. e.*, peristalsis of the intestine. The art of the practice of medicine by applying one special sense—hearing.

Auscultation of the abdomen becomes of value in differential diagnosis in acute coronary thrombosis with abdominal splinting, or early lobar pneumonia and diaphragmatic pleurisy with reflex aperistalsis. Mesenteric thrombosis usually presents problems calling for all the skill and ancillary methods at the disposal of the clinician. Small amounts of ascites often give the patient a feeling of distention, but auscultation will reveal normal peristaltic sounds.

Many abdominal conditions when suspected are more clearly defined and localized if the simple procedure of auscultation is done. No abdominal examination is complete unless the stethoscope is used as a part of such examination.

⁂

H. Brodie Stephens, M. D. (384 Post Street, San Francisco).—Doctor Woolsey, in his customary manner, has presented to us a valuable contribution. He has called to our attention the many aids provided by the intelligent use of the stethoscope; he has particularly stressed the use of this instrument in helping the surgeon arrive at a correct diagnosis of various intra-abdominal diseases, as well as the successful management of the patient following operation.

While hearing Doctor Woolsey's presentation, the oft-time repeated words of the late John B. Deaver came back to me. When speaking of the silent abdomen, which follows the intraperitoneal rupture of an acute suppurative process within the appendix, Doctor Deaver would relate how the surgeon should frequently listen to the abdomen through the stethoscope. In his masterful and dramatic manner he would exclaim, "And now the tinkle of peristaltic waves becomes audible, which means the peritonitis is subsiding, and this indeed is music to the surgeon's ears!"

Doctor Woolsey has justly stressed the great value which lies in this simple method of physical examination. All of us, no doubt, tend to neglect the use of our eyes and ears when we have so many modern laboratory aids at hand. This neglect will certainly do the patient no good and may do him much harm.

It had not occurred to me before hearing Doctor Woolsey's paper how accurately one actually is able to follow his patient's postoperative course by the daily use of the stethoscope. Certainly, we have here an honest indication of what the gut is really doing. Doctor Woolsey is probably very correct in telling us we could dispense with much of our postoperative treatment if we would only use the stethoscope more frequently and intelligently.

A paper such as we have just heard seems to me to be a good one to keep close at hand, one to be read every six months or so. I feel certain that after each reading we shall be better doctors and less dependent on the laboratory.

In closing, I should like to congratulate the author for his excellent paper and to congratulate his patients, too. I believe them to be lucky people!

CALIFORNIA STATE HOSPITALS*

THE PROBLEM OF OVERCROWDING

By Aaron J. Rosanoff, M.D.
Sacramento

This meeting has been called mainly for the purpose of laying before you a plan of attack on the problem of overcrowding in State hospitals; for even a partial and hasty survey of the institutions in our Department has revealed this problem as the largest and most urgent one among those that present themselves at the present time. I need not cite the statistics, which are but too well known to you all. The great fact is that our overcrowding is so great as to be physically and mentally unhygienic, esthetically revolting, and altogether intolerable.

PROBLEM OF OVERCROWDING

This problem is neither new nor peculiar to the State of California. On the contrary, it has existed now for fully a century, in more or less marked degree, in practically every state in the Union. The obvious lesson to be learned, not only from our own experience, but also, and even more impressively, from that of older and more populous states, is that the building of new hospitals, or the enlargement of existing ones, or both, no matter on how large a scale, seems to afford but partial and temporary relief at best. Every state in the Union has had under way for many years an almost continuous program of hospital construction; and none has as yet gotten caught up with its overcrowding.

---

* From the office of the Director of Institutions, State of California.

Read at a special meeting of medical superintendents and social workers, held at the Stockton State Hospital on January 10, 1939.

Accordingly, the question arises, Is it possible to devise a new and more effective policy for dealing with this problem? The plan which I wish to lay before you today assumes that this question may be answered in the affirmative, and represents an attempt to outline such a policy.

AVAILABLE RESOURCES

To begin with, we have now available something over $4,300,000 for major construction in our California institutions; and in the Governor's budget for the next biennium $4,000,000 additional is requested, and will probably be appropriated by the Legislature. Out of this total something over $4,500,000 is to be used for buildings to house patients. In this way our institutional capacity is to be increased by about 3,000 beds, at an average cost of about $1,500 per bed. I believe that this money can be made to go farther in regard to increasing our bed capacity, namely, to gain 4,000, instead of 3,000 beds, without in the least compromising the principle of Class "A" construction. The changes in plans that will be necessary in order to accomplish this will, of course, be fully discussed both with the superintendents of the respective institutions and with the State Architect.

TWO ACUTE NEUROPSYCHIATRIC UNITS PROPOSED

The second feature of my plan consists in the establishment of a 200-bed acute neuropsychiatric unit in connection with the University of California Medical School and Hospital in San Francisco; also, later, a similar one in Los Angeles. The Governor has consented to include in his construction budget for the next biennium $500,000, over and above the proposed appropriations already mentioned, for this purpose; and the University of California has offered to grant to the Department of Institutions a 99-year lease on a part of its land, which is admirably suited for such a unit.

FUNCTIONS OF AN ACUTE NEUROPSYCHIATRIC UNIT

A detailed discussion of the many functions which might be performed to good purpose by an acute neuropsychiatric unit located in a metropolitan area would be irrelevant in this connection. Suffice it to say here that, with the aid of its outpatient department, such a unit would greatly facilitate the recognition of mental disorders in their incipiency, and the application of appropriate treatment at a time when it would often be effective. I have in mind especially the employment of insulin-shock therapy, or metrazol therapy, or combinations of both, in schizophrenic and manic-depressive cases; malarial inoculation or other forms of fever therapy in cases of asymptomatic neurosyphilis, and the like.

This, if carried out on an adequate scale, should have the effect of materially reducing the admission rates of the most important psychotic groups. The State will then no longer maintain its institutions as mere passive receptacles for end-products of psychotic disease committed to them for custodial care as a desperate measure of last resort.

EXTRAMURAL CARE OF MENTAL PATIENTS

The final feature of my plan calls for a large-scale extension of extramural care of mental patients. At the present time about 2,800—which is 11 per cent—of our State hospital patients are out on parole. These consist, for the most part, of patients who have recovered, or have improved sufficiently to be able to return to their homes and to their work. Experience has shown amply that in many chronic cases, too—cases in which recovery would be quite out of the question—the patients can be helped toward an adjustment on parole in self-sustaining employment. It may be estimated conservatively that in this way the percentage of cases on parole can be raised from 11 to 20, or, in actual numbers, from about 2,800 to about 5,000.

INSTITUTIONS FOR THE FEEBLE-MINDED

What has been said concerning the hospitals for psychotic patients applies, to at least an equal extent, to the institutions for the feeble-minded as well. Thus, the outstanding fact in the existing situation is that the daily average of patients on parole can be increased from a total of about 3,500 to one of about 6,000.

SOCIAL SERVICE PERSONNEL

There is, however, but one way of doing this satisfactorily, namely, by greatly increasing our social service personnel. We would require for this purpose, I believe, not only highly qualified and technically trained senior social workers, to have charge of this activity, and junior social workers to assist them, but also large numbers of field workers to be placed under their direction. The field workers for the extramural work would correspond in rank, perhaps, to the attendants whom we employ for our intramural work.

We have now, altogether, sixteen social workers in our service. I am happy to be able to report to you that I have obtained the Governor's consent to include an item of $160,000 in our budget for the next biennium for the employment of thirty-six field workers in the social service departments of our institutions. It is estimated that this should result in a net saving of $940,000 in maintenance cost of patients during the biennium.

But the benefits of such an activity would be not only of a financial character. Generally, in properly organized and supervised extramural care, the patients are happier, the people with whom they live and work are pleased, and the institutions gain something more than relief of their overcrowding.

AUTHOR'S EXPERIENCE WITH PLAN

In an experience of this kind, had a number of years ago in a large State hospital in New York, I personally selected, by a fine-combing of all the wards of the hospital, the best working patients in an intensive drive for extending extramural care. There was much grumbling on the part of some supervisors, attendants, cooks, dining-room employees, shop foremen, farmers, and others, who depended so much on the labor of these patients. Nevertheless, the plan was carried out; and pretty soon a situation arose wherein the employees were confronted with the alternative of either themselves undertaking the work previously done by patients, or breaking in other patients to do it—patients who had previously been idle and perhaps even untidy and destructive to boot.

In the face of this tragic alternative, all our employees, including the most untutored, soon became practical experts in occupational therapy and quickly rehabilitated large numbers of previously idle patients, converting them into excellent workers. That they did it by dint of bribery with tobacco, candy, extra helpings of food, special privileges, money, etc., and even by stooping to gentle diplomacy, is perhaps a sad commentary on the sordidness of human nature, as it manifested itself, in this instance, in both the employees and the patients. As for me, I had not the slightest compunctions; I felt that the end justified the means; and I have never offered an apology to anyone when it turned out, eventually, that a second crop of patients suitable for parole had been found among the newly trained workers.

FIELD WORKERS AND FAMILY CARE

An increase of our social service personnel, particularly by the addition of a large rank-and-file group to which I have referred as field workers, will, I trust, lead to another type of development of extramural care of mental patients, namely, the so-called family care. This consists in boarding out from one to five or six patients for care in private homes by an arrangement whereby the State pays a rate approximately corresponding to the per capita cost of maintenance in the institutions. The patients selected for such care are from amongst those who are too disabled physically, mentally, or both, to earn their board and room. On many farmsteads the cash income from such a source is greatly appreciated.

NEW YORK'S EXPERIENCE

A full discussion of the important and complicated subject of family care of mental patients could hardly be undertaken here. I would recommend for your careful perusal a very practical book on this subject recently published by Horatio M. Pollock, the statistician of the New York State Department of Mental Hygiene.

Over a thousand patients now receive such care in the State of New York, although this system has but recently been started there. It has been in operation for many decades in Massachusetts and in Scotland; and in the famous village of Gheel, Belgium, it constitutes the main industry of the community.

REIMBURSING PATIENTS

A point of some importance, in more respects than one, that should be considered in connection with the general subject of extramural care, is that of the possibility of arranging for the parole of certain reimbursing patients with a view to transferring them from the State hospitals to licensed private institutions. At the present time, for example, the total bed capacity of the private institutions is 3,120; the census of patients in them is 2,213; leaving 907 available vacant beds. The total number of reimbursing patients now in the State hospitals is 3,258. Of them, nearly 600 are paying more than $20 per month, which is the standard reimbursing rate, over 200 paying $40, which is the maximum that the State is permitted to charge under the law. No doubt, some could pay more.

In many of these cases, although probably not in all, an advantage would be gained all around, *i. e.,* for the patients, the State hospitals, the private institutions, and others concerned, if such a transfer were effected.

IN CONCLUSION

This concludes, in general outline, my statement of the proposed policy for dealing with our problem of overcrowding in the institutions of the Department. I should like to have you note especially that none of the features of my plan is new, or experimental, or conjectural. All of them have been thoroughly tried out in various places in this country and throughout the world over periods of years or even decades. What is new is the proposition to organize their operation in the State of California in a fully comprehensive manner.

For this purpose, each of us gathered here today, and each of those who are working under us, should act not so much as an independent unit, or one representing merely a local interest, but rather as a smoothly and effectively functioning element of a larger, more complex, and more important entity—a closely integrated Department of Institutions.

It goes without saying that such a plan as I am proposing cannot be put in operation all at once. I am sure it will require years for its full development. But it will not take care of itself. It will require harmonious coöperation, unity of purpose, and continuous effort on the part of each one of us. You will understand, therefore, my reason for taking it up with you at the very beginning of my service in office.

In so far as there may be differences of opinion among us concerning the fundamental features of the proposed plan, this is the time to have a free and full discussion of them; for at this meeting I should like very much, if possible, that we reach a decision on them by at least a majority of the executive officers of our institutions. When such a decision has been reached and recorded, I feel that any controversy which may have existed concerning the issues involved should henceforth be stilled. Every individual and every institution should then closely and loyally adhere to the policy thus adopted. In the future, any modification of policy, if found necessary, should be permissible only by a decision of a majority of the executive officers of our institutions, arrived at in a manner similar to that which we are pursuing today.

Department of Institutions.

IMMUNIZATION PROCEDURES*

REPORT OF THE COMMITTEE

By E. B. SHAW, M.D.
San Francisco
PAUL HAMILTON, M.D.
Alhambra
AND
H. E. STAFFORD, M.D.
Oakland

YOUR committee, in formulating this report, has restricted itself to a consideration of active immunization; those methods which are utilized in health for the production of a permanent or semipermanent resistence to a specific infection. These procedures have been divided into (1) those of proven value which should routinely be done; (2) those which may be done for special indication; (3) those in which available evidence indicates that they should not be used.

I. PROCEDURES WHICH SHOULD ROUTINELY BE PERFORMED

Every child should be vaccinated against smallpox and immunized to diphtheria.

Smallpox Vaccination.—Smallpox vaccination should be performed at an early age and is ideal at six months. Between six months and two years of age, reactions to vaccination are minimal, and there is practically no danger of postvaccinal encephalitis. Vaccination should preferably be performed on the arm after thorough cleansing of the skin. There is less risk of infection in arm vaccinations, and if the site chosen is the posterior medial aspect of the upper arm, the resultant scar is extremely inconspicuous. In girls, great care should be taken to place the vaccination well out of sight under the arm. There are several methods of vaccination, but the best consists of placing a drop of glycerinized virus at the prepared site, and making several tangential strokes into the skin through the drop of virus. A single puncture will often produce a successful vaccination, and no more than ten strokes is necessary for first vaccination. It is permissible, perhaps preferable, to apply no dressing whatever; but the vaccination may be very lightly covered by several thicknesses of gauze which are loosely affixed to protect against scratching by the child. The vaccination should be inspected and dressed in one week, at which time the application of a mild antiseptic, such as tincture of merthiolate, helps to cut down subsequent infection. It is important that tight dressings of any kind be absolutely avoided.

Revaccination should commonly be done when the child first attends school, or when epidemics occur, and at intervals thereafter of from five to seven years. Revaccinations should be inspected in forty-eight hours in order to observe the accelerated take which is evidence of immunity. A vaccination which shows no reaction of any kind, either at forty-eight hours or at one week, does not indicate that the patient is immune to smallpox. All considerations of safety indicate that first vaccinations should be done in infancy, and not be deferred until school attendance.

Diphtheria. There are several satisfactory methods of producing immunity, but three injections of formolized toxoid give such excellent immunity that it is the method of choice. Two injections of ½ and 1 cubic centimeters, at three or four-week intervals, give nearly as good results. As a public health procedure, the percentage of immunity is so high it is not necessary to confirm it by the performance of a Schick test; but in private practice it is better to demonstrate immunity by a Schick test done three to six months after immunization.

Alum toxoid, in a single dose, does not give a corresponding degree of immunity, and repeated doses of alum toxoid have no advantage over formolized toxoid. A single dose of alum toxoid, followed by a dose of formolized toxoid in three or four weeks, is an acceptable procedure, and has some advantage in the speed with which some degree of immunity is produced. Toxin-antitoxin mixture is much less effective, but may be used in adults or older children who react to ordinary toxoid. The preferable method, however, of immunizing older children and adults is by the use of a series of smaller doses, beginning with 0.1 cubic centimeter, avoiding severe reactions and cautiously increasing the dosage. Three injections of 0.1, 0.2, 0.2 will frequently produce immunity, but the average adult may have the dosage increased, with an eye to the resultant reactions, and be given 0.1, 0.25, 0.5, and a final dose of 1 cubic centimeter, with the production of a high degree of immunity and no severe reaction.

Diphtheria immunization should routinely be done near the end of the first year of infancy, and should not be deferred until first school attendance. In infancy the immunity response is excellent and is better maintained; reactions are slight or nil, and protection is thereby secured through the early years of life when the hazard of the infection is greatest.

Schick Test. The Schick test is performed by injecting 0.1 cubic centimeter of a ready diluted toxin in peptone buffer intradermally into the skin of the forearm. The test is read in forty-eight to seventy-two hours; an area of redness greater than 0.5 centimeter in diameter denotes susceptibility. In small children, pseudoreactions are encountered very infrequently.

Diphtheria immunity is a relative, and not a "solid" immunity; but the universal performance of immunization affords tremendous protection against diphtheria.

II. PROCEDURES WHICH SHOULD BE DONE FOR SPECIAL INDICATIONS

1. *Typhoid Vaccination.* The injection of typhoid vaccine, in the usual series of three doses of the available vaccine, produces an active immunity which is fairly reliable for one to three years. The

---

* Report submitted by Special Committee to the Pediatric Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9–12, 1938.

dosage need not be much reduced for small children, and reactions in the young are minimal. In the average urban community public health safeguards afford sufficient protection against typhoid. Immunization should be practiced in any community in which the hazard of typhoid exists, or among those entering such a district.

It is impossible to make any test of the immunity conferred against typhoid.

2. *Whooping Cough.* There is evidence that some degree of protection is conferred against whooping cough by the injection of properly prepared Phase I vaccine. The degree, duration, and potential value of this method have not as yet been definitely demonstrated, and the occurrence of known occasional failures indicates the necessity for a critical point of view, and renders it unfair and unwise to promise too much to the parents regarding the immunity produced. Immunization, in order to be useful, must be given early in life, may be begun as early as the third month of life, and, if used as a routine, should not be deferred later than the fifth to seventh month, so that protection may be secured during the time of greatest hazard. There are several preparations of whooping cough vaccine which may be used, but injections should be given at weekly intervals with the administration of a total dosage of 80 to 100 billion organisms.

3. *Scarlet Fever.* Opinion varies regarding the precise value of this immunization. Reactions to the injections are sometimes unpleasant and the necessity for five doses is disadvantageous. The procedure is somewhat more unpleasant, and somewhat less effective, than diphtheria immunization, and the degree and duration of immunity are less certain.

Susceptibility to scarlet fever is in general indicated by a positive Dick reaction. This test is performed by the intradermal injection of 0.1 cubic centimeter of Dick test toxin, prepared for this purpose; an area of redness of 0.5 centimeter or larger at the end of twenty-four hours indicates susceptibility. After immunization, the presence of a negative Dick test should always be ascertained.

The immunizing dosage consists of five weekly doses of scarlet fever toxin, prepared for this purpose and consisting of 500, 800, 2,000, 8,000, 80,000 units.

The committee feels that scarlet immunization should especially be used for the protection of nurses and attendants in hospitals, or for other conditions where unusual hazard of infection exists. It does not recommend that scarlet immunization be generally employed as a public health or school health procedure, or used routinely in private practice.

4. *Tetanus.* A degree of immunity against tetanus is produced by the injection of 0.5, 1, and 1 cubic centimeter of tetanus toxoid at weekly intervals. This is not recommended as a routine procedure, but only under special conditions of exposure. This method should not be instituted under conditions which call for the prophylactic use of tetanus antitoxin.

5. *Rabies.* Active immunization should be attempted only following known or suspicious exposure by dog bite. Either Semple or Cummings vaccine may be used in fourteen or twenty-one doses, but in all suspicious bites about the head and face, or in young children, twenty-one injections should invariably be employed. One per cent procain or novocain, intradermally and subcutaneously at the site of injection, does much to reduce the resultant discomfort.

It is important to mention that cauterization with fuming nitric acid is by far the most effective agent which can be used in addition to active immunization.

III. METHODS WHICH SHOULD NOT BE EMPLOYED

The committee is of the opinion that methods proposed for the production of active immunity against poliomyelitis and tuberculosis contain potential dangers and experimental pitfalls which contraindicate their routine use in private practice.

IV. ADDITIONAL COMMENTS

The committee considers there is no proven agent for the production of active immunity against epidemic encephalitis, erysipelas, epidemic meningitis, epidemic parotitis, pneumonia, measles, or varicella.

The precise utility of respiratory vaccine for the prevention of the common cold, recurrent sinus and upper respiratory infections defies precise scientific definition. The immune response which follows the injection of respiratory vaccine cannot be demonstrated in the test tube, and has not conclusively been proved by controlled clinical experiments. The use of this vaccine is widely, and at least harmlessly, employed, and by men of unquestioned scientific attainments. The committee feels that the demonstrable utility is likely to be limited to the treatment of the allergic individual whose "colds" are on an allergic background.

CONCLUSIONS

There are a limited number of things which should be done to the average well child. Only those things which are unfailingly useful, safe, and effective should be advocated routinely. Those whose status is less conclusively proven should not be employed without their limitations being carefully explained. Most "immunization campaigns" undesirably emphasize the performance of immunization at school age. The importance of smallpox and diphtheria immunization in infancy should constantly be emphasized, and if anything is to be accomplished by whooping-cough immunization this should also be done in early infancy.

Your committee has made free use of a similar report recently issued by a committee of the American Academy of Pediatrics.

BLIND LAWS OF CALIFORNIA: SOME COMMENTS*

By John P. Lordan, M.D.
Los Angeles

In the State of California, during the year 1937, $2,309,726 was spent on aid to the needy blind. About one-third was furnished by the Federal Government through its Social Security Act, one-third provided by the State of California, and the remaining one-third by the counties.

In December, 1937, the State Social Welfare Board appointed an Advisory Committee of Ophthalmologists. Dr. Percival Dolman (chairman), Dr. Joseph McCool, and Dr. Joseph William Crawford made up the committee in Northern California, while Dr. George H. Kress (chairman), Dr. A. Ray Irvine, and Dr. John P. Lordan were the members for Southern California.

These two boards have met separately and in joint conference and have considered some of the problems confronting the State Social Welfare Board, Division of the Blind. Of paramount importance is the selection of a state ophthalmologist to work with the Blind Division on the advice of the consulting committees. At the time of this annual session this matter is still pending before the Social Welfare Board.†

COMMITTEE'S REVISED REPORT CARD ON BLIND APPLICANTS

Everyone has realized that the physician's report blank on blindness in use up to the present was unsatisfactory. This was taken up by the committees, the result being that a new form is now available. The confusion resulting from the placing of the left eye column before the right eye has been eliminated. There has been more room for the description of the findings made at the examination. A most important addition has been made to the bottom of the physician's report regarding the Social Security Board's instructions in determining blindness. The visual acuity is plainly stated, along with the amount of peripheral field contraction, to qualify the applicant as blind. It is probably well to emphasize here that all the physician is now asked to certify is "that he is a duly licensed practicing physician, skilled in treating diseases of the eyes, and that the applicant comes within the classification of blindness as stated at the bottom of the physician's report." In the event that a case is certified as blind by a physician, even though the degree of blindness stated is clearly not within the classification, such a case will not be reimbursed by the Social Security Board. This will leave the burden of care entirely upon the state and county.

EXAMINATION FEES

Where the applicant for blind aid desires to challenge the examining doctor's report that he is not blind, the Social Welfare Department is handling such individuals as they are now handled by the State Compensation Insurance Fund, *i. e.*, the second examination is paid for by the applicant, and the third by the state, the recommendations being made on the basis of the two agreeing reports.

Physicians' fees for examination are past due and unpaid owing to the influx of applications and renewals from all the counties. At this writing, a total of $3,601.50 has been paid by the Comptroller, indicating 720 examinations at $5 each. Two hundred seventy-one more invoices are pending in the Comptroller's office; two hundred more have been signed and in about a month the checks will be issued.

The Social Security Board requires that certain social data be obtained regarding all cases open or closed for aid to the blind. The following tables have been compiled from the more elaborate federal form. These tables give some indication of the type of information available.

ANALYSIS OF TABULAR DATA

Table 1.—Individuals receiving aid to the blind in California from August, 1929, to February,

Table 1.—*Individuals Receiving Aid to the Blind in California August, 1929, to February, 1938, by Months*

	Year									
Month	1929	1930	1931	1932	1933	1934	1935	1936	1937	1938
January		491	1,076	1,472	1,996	2,296	3,216	3,936	4,542	5,324

---

* Read before the Eye, Ear, Nose and Throat Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9–12, 1938.

† A part-time state ophthalmologist was appointed in the month of June, 1938.

TABLE 2.—*Cost of Aid to the Blind in California*

	Total	Federal Funds	State Funds	County Funds
Actual expenditures for aid before federal funds became available; August 14, 1929, through June 30, 1936 (almost seven years)	$6.409,364		$3,204,682	$3,204,682
Actual expenditures from time federal funds were first received through the last fiscal year; July 1, 1936, through December 31, 1937 (one and one-half years)	$3,223,655	$1,191,345	$1,016,156	$1,016,154
Two and one-quarter million a year; increase two and one-quarter times in past one and one-half years since federal funds became available.				
Estimated expenditures for next five years under present laws	$17.280,000	$5,363,712	$5,958,144	$5,958,144
Estimated expenditures for next five years if federal funds are withdrawn	$17,280,000		$8,640,000	$8,640,000

1938, by months. You will notice that the cases have increased at the rate of about five hundred a year until there were, in February, 1938, 5,451 individuals receiving aid.

TABLE 3.—*Report for Month of November, 1937*

	Individuals	Amount	Average
State of California	5,100	$245,117.84	$48.06
Los Angeles County	2,572	$124,164.47	$48.28

Table 2 reveals that the cost of aid in the seven years prior to federal participation averaged about a million dollars a year, which was borne by the state and county funds. Since federal participation, the amount has increased to two and one-quarter million a year, or an increase of two and one-quarter times what it had been in the past. The estimated expenditures for the next five years under the present laws are $17,280,000.

TABLE 4.—*Aid to Blind: For Certain States*

California is second in total number receiving aid with 5,100.
Pennsylvania first with 10,932.
Ohio third with 3,747.
California is second in total payments with $245,118.
Pennsylvania first with $327,081.
Ohio third with $69,185.
California is first in average amount paid of $48.06.
Washington second with $34.46.
Wyoming third with $30.34.

Table 3 shows that over half the blind in the State of California are living in Los Angeles County, and that the monthly expenses run about $125,000, or $48.25 per person per month.

Table 4—One might well ask what is California's position with relation to other states, with plans approved by the Social Security Board. As of November, 1937, the data incorporated in Table 4 reveals some interesting contrasts.

TABLE 6.—*Individuals Accepted for Aid to the Blind: Classified by Age*

Age Groupings	Number	Per Cent
Total	1,534	100.0
16 and under 18	9	0.6
18 and under 25	50	3.2
25 and under 45	228	14.9
45 and under 60	363	23.7
60 and under 65—81 per cent	194	12.6
65 and over	690	45.0

The average grant for thirty-seven states was $25.58. Arkansas was lowest with $9.08, and Alabama second with $10.10. Only Maine and Pennsylvania are ahead of California in the number of recipients per 100,000 population.

Table 5 lists the expenditures for public assistance for the year 1937, the blind aid being the least in amount of the various types of public assistance. However, considering the limited number of individuals on blind aid as compared, for instance, with

TABLE 5.—*Expenditures for Public Assistance in California, January 1, 1937, to December 31, 1937*

	Total	Federal	State	County
Total	$148,807,279	$97,589,022	$31,513,438	$19,704,819
Works Progress Administration	81,834,000	81,834,000		
Old-age assistance	30,859,524	13,766,166	8,546,679	8,546,679
State Relief Administration	19,853,227		19,853,227	
County indigent aid	9,222,871			9,222,871
Children's aid	4,727,931	1,157,148	2,374,523	1,196,260
Blind aid	2,309,726	831,708	739,009	739,009

TABLE 7.—*Individuals Accepted for Aid to the Blind During Period November 1, 1936, Through June 30, 1937. Classified by Living Arrangements*

	Number	Per Cent
Total	964	100.0
Alone	168	17.4
In household group with relatives	624	64.7
In household group not with relatives	80	8.3
In voluntary institution, incorporated not for profit	24	2.5
In boarding home or lodging house	39	4.1
Other arrangement	26	2.7
Unknown	3	0.3

the county indigent, it is obvious that the blind aid is relatively high per person.

OTHER FACTUAL DATA CONCERNING BLINDNESS

Tables 6 to 11 elicit some interesting facts concerning the individuals receiving blind aid. It is shown that 81 per cent are over forty-five years of age, with more than half of them over sixty years.

TABLE 8.— *Individuals Accepted for Aid to the Blind During Period November 1, 1936, Through June 30, 1937. Classified by Number of Types and Other Assistance Received Simultaneously With Aid to the Blind in Households Having at Least One Person Accepted for Aid to the Blind.*

	Number	Per Cent
Total	964	100.0
No other type of public assistance	710	73.7
One additional type of public assistance	248	25.7
Aid to dependent children	18	1.8
Old-age assistance	54	5.6
Other public assistance (county, SRA, etc.)	176	18.3
Two additional types of public assistance	6	0.6
Aid to dependent children and other public assistance	5	0.5
Two types of other public assistance	1	0.1

The information given in Table 7 is further borne out when we see, in Table 8, that three-fourths of these households are receiving no other type of public assistance other than blind aid.

TABLE 9.—*Individuals Accepted for Aid to the Blind During the Period November 1, 1936, Through June 30, 1937. Classified by Race and Sex*

	Total		Male		Female	
	Number	Per Cent	Number	Per Cent	Number	Per Cent
All races	964	100.0	540	100.0	424	100.0
White	805	83.5	445	82.4	360	84.9
Negro	77	8.0	46	8.5	31	7.3
Other	82	8.5	49	9.1	33	7.8

Table 7 shows that two-thirds are living with relatives, who claim they are unable to provide for the blind one, and are more than likely deriving some support from him.

In *Table 9* is pointed out that 83 per cent of the cases were of the white race, and in the next that three-fourths are native and one-fourth foreign-born.

TABLE 10.—*Individuals Accepted for Aid to the Blind During Period November 1, 1936, Through June 30, 1937. Classified by Nativity and Race*

	All Races		White		Negro		Mexican		Other	
	Number	Per Cent	Number	Per Cent	Number	Per Cent	Number	Per Cent	Number	Per Cent
Total	964	100.0	805	100.0	77	100.0	42	100.0	40	100.0
Native-born	711	73.8	603	74.9	65	84.4	12	28.6	31	77.5
Foreign-born	238	24.7	193	24.0	11	14.3	27	64.3	7	17.5
Europe	159	16.5	148	18.4	11	14.3				
Asia	12	1.3	5	0.6					7	17.5
America (not United States)	64	6.6	37	4.6			27	64.3		
Other	3	0.3	3	0.4						
Unknown	15	1.5	9	1.1	1	1.3	3	7.1	2	5.0

Table 11.—*Native-Born Individuals Accepted for Aid to the Blind During the Period November 1, 1936, Through June 30, 1937. Classified by Section of Country.*

	Number	Per Cent
Total	711	100.0
New England	20	2.8
Middle Atlantic	68	9.5
East North Central—42 per cent	157	22.1
West North Central	138	19.4
South Atlantic	19	2.7
East South Central	39	5.5
West South Central	68	9.6
Mountain	37	5.2
Pacific	161	22.6
Washington or Oregon	32	4.5
California	129	18.1
Outlying possessions	4	0.6

From where the blind come to California is well indicated in Table 11. Forty-two per cent come from the east and west north central states, and there is the equally significant figure of only 18 per cent being native Californians.

Table 12 classifies the 25 per cent that are foreign-born, emphasizing that nearly half are aliens who represent about 12 per cent of the total receiving blind aid.

COMMENT

Statistics as to where the blindness was contracted are as yet not available. This certainly should be incorporated in the social history of the patient. It would then be possible to determine how much of the "blind load of the United States was being dumped into California."

There are no figures obtainable on causes of blindness in this state. This table represents the causes as ascertained by several thousand applicants for aid from 1922 to 1936, in Missouri, Illinois, and Pennsylvania. For comparison, the amount of blindness from the same diseases appearing in students in schools for blind children appears in the last column. Of especial interest is the high figure—about 20 per cent in each group—due to cataract. Whether of unoperated, or the end-results of unsuccessful surgery, is not stated. Glaucoma contributes about 10 per cent, and the amount of congenital hereditary blindness is striking. Trachoma as a cause of blindness in Missouri, while almost nonexistent as a cause in Pennsylvania, is most interesting.

Now that the Federal Government has begun its fight against syphilis, we can expect the 15 per cent of blindness due to this disease to be reduced. In considering prevention of blindness it is probably known to all that smallpox was the greatest single cause of blindness many years ago.

Table 12.—*Foreign-Born Individuals Accepted for Aid to the Blind During Period November 1, 1936, Through June 30, 1937, Classified by Citizenship and Sex*

	Total		Men		Women	
	Number	Per Cent	Number	Per Cent	Number	Per Cent
Total foreign born 24 per cent of all cases	247	100.0	144	100.0	103	100.0
Citizen	123	49.8	73	50.7	50	48.5
First papers	9	3.6	8	5.6	1	1.0
Alien	115	46.6	63	43.7	52	50.5

Twelve per cent of total cases on blind rolls are aliens.

Table 13.—*Causes of Blindness: Period 1922-1936*

	Illinois [1] Per Cent	Missouri [2] Per Cent	Pennsylvania [3] Per Cent	Children [4] Per Cent
Cataract	20.0	15.0	22.0	15

[1] Illinois—3,517 blind pensioners.

[2] Missouri—7,126 blind eyes.

[3] Pennsylvania—11,852 blind eyes.

[4] Children—2,702 children.

TABLE 14.—*Cases Closed for Aid to the Blind During the Period November 1, 1936, Through June 30, 1937, Classified by Reason, for Closing Case.*

	Number	Per Cent
Total	564	100.0
Death largest cause for closing case	292	51.8
Vision wholly or partially restored	6	1.1
Admitted to public institution	58	10.3
Became self-supporting for reasons other than restoration of sight	30	5.3
Relatives became able to support	46	8.1
Moved out of district	37	6.6
Not eligible for original grant	74	13.1
Other reason	21	3.7

HOW CASES ARE "CLOSED"

Table 14 gives the reason for closing cases. It is instantly obvious that the only way that over half the cases can be removed from the blind rolls is by the death of the recipient. Two other classifications, one not originally being eligible for the grant in 13 per cent, the other having vision restored in one per cent, afford other possible means of closing cases. The Social Security Board feels that about 10 per cent could be closed if surgery were mandatory where it is clearly indicated. This is already the law in the states of Oregon and Washington.

COMMENT

Oregon, with thirty-six counties, has 405 needy blind receiving an average of $25.03 a month.

Oregon has thirty-six counties. Capital, Salem.

Four hundred and five blind persons were receiving assistance as of June 30, 1937.

Average amount of aid, $25.03.

Maximum amount of aid allowable per month. $30.

This state has an Advisory Board of three ophthalmologists.

HISTORY OF CALIFORNIA LAWS FOR BLIND

The law granting state and county aid to the needy blind in California was enacted by the Legislature in 1929. Prior to the enactment of this legislation the needy blind were granted $15 a month by the counties. Amendments to the law were enacted in the regular legislative sessions of 1931, 1935, 1937, and the extraordinary session of 1936. The aid is administered in California by the counties under the direction and supervision of the State Department of Social Welfare. Provision for this supervision was included with legislation enacted in 1929. Since July 1, 1936, the Federal Government has been participating in aid to the blind in California under the Social Security Act by a grant of one-half of whatever amount of aid is allowed, up to $30 a month. Amendments passed in the legislative session of 1937 have liberalized the provision for the state's needy blind.

At present the amount of aid the individual can receive is $50 a month, with the privilege of increasing this to $83.33 per month from other sources, *i. e.*, income from real and personal property owned by applicant, gifts, or applicant's own labor. A wife living separate from her spouse may receive separate aid to the same amount, or a maximum aid possible for the two of $166.66 per month.

In conclusion, the members of the Advisory Committees hope that these comments on the needy blind and the blind aid law will make all ophthalmologists, all doctors of medicine, and all citizens of the State of California, more familiar with this worthy cause in which we are all so vitally interested. It is our wish that you register your opinions before your local medical societies, and that out of your discussions may come helpful suggestions in this problem.

2007 Wilshire Boulevard.

A PLEA FOR CONSERVATIVE OBSTETRICS *

By ABRAHAM BERNSTEIN, M.D.
San Francisco

DISCUSSION *by Robert D. Dunn, M.D., Palo Alto.*

STATISTICS show that of every two hundred women who become pregnant, at least one dies. Seven per cent of the deaths of women between the ages of twenty and forty years are due to puerperal infection. Conservatively estimated, twenty-three thousand women die every year in the United States from the immediate and remote effects of childbirth. Tuberculosis is first, childbirth is second, in the number of deaths in women from fifteen to forty years of age. One hundred thousand babies die every year in the United States during delivery, and another one hundred thousand die in the first four weeks thereafter. This is three times as many men's lives as were lost in the World War, and these mothers' and babies' deaths were from causes largely due to the process of childbirth itself, and largely preventable.

What are the causes of these evils? The standard of obstetric practice is low. People are allowed to believe that labor is a natural process and requires no special care. Therefore, men with the best minds and with the greatest skill find their endeavors better rewarded in other specialties of medicine.

The Scandinavian countries show a 4 per cent operative obstetrics against our 10 to 30 per cent. Sweden, Norway, Denmark, and Holland have the lowest rate. Scotland's mortality is as high as that of the United States.

MATERNAL MORTALITY RATE

	Per 10,000 Live Births
Sweden	27
Scotland	59
United States	67
Italy	26
Japan	35

There is no question that better conservation of mother's strength during labor and better trained obstetricians would result in fewer indications for forceps, and consequently we would have less sepsis, hemorrhage and shock, and, naturally, better results.

---

* From the Department of Obstetrics and Gynecology, Franklin Hospital, and the University of California Medical School.

For the past decade the infant mortality rate in San Francisco has steadily declined. Doctor Geiger showed that, in 1934, the rate dropped to an all-low of thirty-three per one thousand live births; in 1935, rose to thirty-five; and in 1936 to forty-two per one thousand. In San Francisco, as in other cities, the majority of infant deaths occur in the neonatal period.

CAUSES OF MATERNAL DEATHS

The causes of maternal deaths are criminal abortion, drugs used to bring on abortion, and high forceps, or even low forceps. Cesarean section also takes its toll, especially when done after the patient is infected or has been in labor a long time. In potentially infected cases, where a patient has been examined vaginally and forceps attempted with poor results, the Latzko or extraperitoneal cesarean section should be performed; this would decrease our mortality rate for cesarean section to some extent.

FORCEPS DELIVERIES

As far as forceps delivery is concerned, the advantages occurring largely benefit the mother, since there is little acceptable evidence that instrumentation is advantageous to the child. I make this statement despite the fact that three-fourths of all forceps deliveries are undertaken because of so-called fetal distress, as indicated by variations in the rate and rhythm of the fetal heart tones. On the assumption that compression of the head and congestion of the cerebral vessels produce the fetal cardiac variations, the birth of a live child after further compression by forceps would seem to constitute *prima facie* evidence that the hurried delivery was not necessary; as a matter of fact, failure to utilize this excuse for the application of instruments does not disturb the fetal mortality rate. Moreover, there is no good reason to believe that forceps delivery in the course of a slow labor diminishes the risk to the child, in spite of numerous recent warnings that the infant's head may be injured by pounding against the pelvic floor.

Rapid birth, whether preceding naturally or developed artificially by the injudicious use of pituitrin, is far more dangerous to the child, because of the increased likelihood of intracranial hemorrhage. However, there are rare conditions which arise, such as prolapsed cord with the head well down in the canal, in which rapid forceps extraction may be life-saving.

Excluding the large number of "convenience forceps" deliveries done under the name of prophylaxis to save the child or mother from varied and sundry difficulties, the generally recognized indications are eclampsia, placenta previa, heart decompensation, and abruptio placenta. There really is no place in obstetrics for the so-called "convenience forceps." Figures on both the immediate and late injuries to the child show beyond a doubt that the higher the station of the fetal head at the time of delivery the more damage is done. Novey, of the University of Maryland, reports 5 per cent forceps deliveries in a series of 16,442 cases covering a ten-year period and delivered on the clinic service. The number of forceps deliveries was one in twenty-nine. The total mortality was 1.76 per cent and the corrected infant mortality was 9.4 per cent. From the figures which Novey presents, one can with assurance draw the conclusion that forceps is a dangerous instrument and should only be used upon suitable indications, and only by one skilled in its application.

Plass, in his report in 40,143 births in Iowa, shows a forceps incidence of 7.1 per cent. In the hospital deliveries, the forceps incidence was 13.8 per cent, while in the home the incidence was 4.5 per cent.

The lower operative incidence in home practice was associated with a stillbirth rate 2.45 per cent lower than that obtained in the hospital, 3.61 per cent.

At the Franklin Hospital, in a series of 2,608 deliveries, there was a forceps incidence of 14.6 per cent and a fetal mortality rate of 2.2 per cent.

In the late Doctor Breitstein's practice, in 8,850 deliveries there was a forceps incidence of 12.8 per cent and a fetal mortality of 3.8 per cent.

In my own practice, up to the present time, I have a forceps incidence of 14 per cent and a fetal mortality of 2.5 per cent.

Difficulties in forceps delivery usually appear because the physician has not demanded fulfillment of the classic conditions for the safe application of instruments, namely, that the cervix must be fully dilated or easily dilatable; there must be no disproportion between the head and the pelvis; position of the head must be accurately known so that the blades may be applied in the biparietal diameter and rotation effected in the proper direction, and the bag of water must be ruptured.

The application of forceps through a partially dilated cervix is dangerous, because further dilatation under such circumstances is often accomplished at the expense of lacerations, which may extend up into the lower uterine segment and cause severe bleeding.

Manual dilatation or radial incisions, according to the technique of Duhrssen, offers a more satisfactory solution when immediate delivery is necessary for a cervix that is not fully dilated.

The danger to fetus and mother in forceps delivery depends largely on the indication under which the procedure is undertaken. It also depends on the skill of the operator, but especially on the station of the head. Obviously, there is less danger on a low or perineal forceps than on a mid- or high-forceps delivery.

Cervical lacerations occur with forceps deliveries many times, and immediate repair of such cervical tears has considerable support in many clinics.

CONCLUSION

In conclusion, I wish to emphasize that women are no different today than they were a thousand years ago. They should be given every chance in the world to have their babies naturally. More conservative obstetrics, and less hurry, will certainly give us better results and help decrease our high maternal mortality rate.

350 Post Street.

DISCUSSION

Robert D. Dunn, M. D. (300 Hamilton Avenue, Palo Alto).—There is no doubt that the high fetal and maternal morbidity and mortality in this country are due in part to untimely interference by the obstetrician. This morbidity and mortality usually occur when interference is attempted with the head at too high a station and the cervix not fully dilated. If patience could be the watchword when the fetal heart shows no embarrassment to the child and the maternal pulse indicates no deleterious effect on the mother, labor would often advance surprisingly normally. This patience, of course, is difficult to practice even in moderately long labors, when one has the family of the patient constantly demanding that the doctor "do something."

In modern obstetrics this situation is most easily handled by the use of analgesia. The patients under influence of medication do not suffer, and thus permit more prolonged labor. This added time will decrease the incidence of mid-forceps considerably, but will increase the use of outlet forceps. The latter, however, in trained hands, cannot be considered a factor in increasing either maternal or fetal mortality.

High forceps should have no place in modern obstetrics. Although the mortality of cesarean section is high, that of high forceps is greater. If a patient is infected, with the head still not engaged, either a Latzko extraperitoneal cesarean section or a uterine marsupialization is safer than a high forceps procedure.

Conservatism does not imply a strictly *laissez faire* policy. It is most essential that the actual condition of the case at hand be understood. Then, if necessary, skillful and timely intervention is just as much a part of conservative treatment as the nonoperative approach to normally advancing cases.

If the author's plea for conservative obstetrics is to be effective, it is important for us to teach our medical students that interference in an obstetrical case is as serious as undertaking a major surgical operation. Thus, it should be attempted only after careful consideration, and if there is any question as to the advisability of such a procedure, consultation is often a help and always a protection.

THE LURE OF MEDICAL HISTORY†

TRUTH OVERTAKES "DOCTOR HUNTER"

By A. W. Meyer, M.D.
Stanford University

PART I

"Whatever the truth may be, it is best that we should know it; and for truth of any kind we should keep our heads and hearts as cool as we can." Thus wisely counseled James Anthony Froude, in his admirable essay on the science of history. Since the two great Scotsmen, John and William Hunter, have been dead so long, it should not be difficult for anyone to keep his head and heart cool, with respect to the controversy between them. And, as for the truth in the matter, it has been available though apparently unrevealed ever since 1762. It is found in the apparently forgotten though crucial words of William himself. Although we had tried to learn the facts regarding the bitter controversy, this damaging footnote was not mentioned in the biographies, essays, addresses, Hunterian lectures and orations consulted. And, although Paget severely characterized the *Medical Commentaries* which contain it, and discussed the well-known estrangement, this footnote apparently had no special significance for him.

AUTHOR'S FORMER REFERENCES

In a footnote to Essays on the History of Embryology,[1] I incidentally expressed sympathy with John in his quarrel with William. I felt prompted to do so after carefully reading John's contribution, of 1780, to the Royal Society of London, entitled "On the Structure of the Placenta," and pondering the letters written by these gifted men regarding it. A few years later, when considering the work of John in embryology, I further stated:

> It is difficult to contemplate the splendid royal folio on the gravid uterus[2] by William without sympathy for John. It does not seem possible that the latter could have said what he did, and taken the steps he did more than a generation afterward, if he himself had not made the discovery he claimed, regarding the uteroplacental circulation; and surely nothing could be more evasive than the rejoinder of William. John was very specific and said that William received his conclusion with raillery at the time.[3]

When discussing the contributions to embryology of the Hunters, I reverted to the subject, adding:

> It may have been fortunate that John was probably unaware of the views of "eminent anatomists" referred to by Haller on this matter, unless he could also have known what Aranzi and others had thought, and what Falconnet and others [especially Monro, Sr.] had done, in order to solve the vexed problem of the uteroplacental circulation. Concerning the controversy between the two, Teacher regarded the account of William more probable than that of John. [However], one cannot contemplate the rejoinder of William to John, made to the Royal Society on February 3, 1780, without noting its evasion and ambiguity. It must be wholly unconvincing except to those to whom the possession of stolen goods is conclusive proof of their rightful ownership, for that is a form of reasoning resorted to by William. Moreover, one cannot help wondering what experience William had that caused him to declare to his students that ". . . most philosophers, most great men, most anatomists, and most other men of eminence lie like the devil." . . . it is well to recall William's words regarding the fetal and maternal portions of the decidua as quoted by Teacher (p. lvi), which are to the effect that the vessels of these two parts are separate because "those of the umbilical always 'remained uninjected.' 'It was this appearance,' he says (in his lectures of 1775), 'in the cat and bitch that first led me into the apprehension that the human placenta was the same. I thought this for a long time, but I never cared to assert it openly till within these few years.' "[4]

COMMENT

Since John claimed that he discovered the independence of the uteroplacental circulations in 1754, the last sentence in the above quotation alone would seem sufficient to dispose of William's claim. But, had he really thought so "a long time," that is, before 1754?

This [1755] was within a year of the time when he [John] had the exceptional opportunity to study and dissect a human uterus with fetus near term, injected by McKenzie, and the occasion on which John apparently rediscovered the independence of the maternal and fetal circulations. It seems that the cadaver had been injected through the uterine, and the unborn child through the umbilical vessels, and John said that he conceived the idea of the independence of the circulations while dissecting the placenta. Although he later wrote that his elder brother received the idea with "raillery," when he broached it to him at the time, it is a well-known fact that William maintained that it was his own discovery, and that he always had incorporated the idea in the first and only public lecture in the fall of every year. [But] had William sponsored the idea of the independence of the two circulations before 1754, it is extremely unlikely that John would have remained unaware of it, and he, hence, would have had no occasion to think that he had made a discovery when dissecting the female body injected by McKenzie, and so report to William. Moreover, according to Paget, the manuscript notes taken by one who attended William's lectures in 1755–1756 show "that William Hunter, even then, a year after the discovery of the placental structures, neither spoke of it nor understood the meaning of it"—the uteroplacental circulation. These words also are in complete accord with those quoted above from Teacher, and also [with] those from the anonymous auditor apparently written after the death of William, and, if true, fully confirm John's statement regarding William's reaction to the idea. Moreover, careful scrutiny of the text written by William himself for his famous folio, published in 1774, twenty years after John's rediscovery, confirms Paget's view completely, for the independence of the two circulations is only implied, not represented or asserted there.[5]

---

† A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

[2] Hunter, William: Anatomia uteri gravidæ. Birmingham, 1774.

[3] California and West. Med., Vol. 43, No. 5, p. 362, col. 1, par. 2 (Nov.), 1935.

[4] California and West. Med., Vol. 46, No. 1, p. 38, par. 2 (Jan.), 1937.

When considering the controversy further, I wrote:

> ". . . it may be recalled that William said that his 'discovery' of the independence of the fetal and maternal circulations had been acknowledged by Haller thirteen or fourteen years before the disagreement with his brother John in 1780, in Haller's *Elementa physiologiæ corporis humani*,[6] Vol. 8, p. 220, which appeared in 1766. However, instead of having credited William with the discovery, Haller merely gave a brief summary of William's ideas in an addendum, retaining the contrary idea in the text and saying that Hunter's ideas regarding the decidua have been 'partly corrected and partly confirmed.' According to Haller's statement in this addendum, William believed that a liquid injected into the vessels of the uterus 'pours into every cellular part of the placenta, and from these cells returns into the broader veins of the uterus. None of it passes into the branches of the umbilical vessels. When the umbilical artery is filled with a colored liquid, while the placenta still adheres to the uterus, the branches of the umbilical arteries and veins are all completely and readily filled; yet nothing passes into the vessels of the uterus, unless the liquid has poured into the cells of the placenta.' Haller, hence, merely stated that William believed that the two circulations were independent without characterizing the idea as a discovery. Since this was written in connection with a historical summary of the idea, it is not without significance."

What is of special significance, however, is the fact that it was in this connection that Haller referred to page 52 of the *Medical Commentaries*[7] of 1762 where William stoutly maintained the opposite view.

OTHER COMMENT

Teacher (1900) concluded that ". . . it is unreasonable to suppose that they [the injections] were figured then [1750], yet only understood in 1754." (p. lvi.) But it seems equally strange that William should have remained silent in 1774 in regard to what he said, in 1780, he so firmly believed and thought he had discovered [before] 1754. I do not know upon what grounds Teacher (1899) stated that William's conclusion regarding the distinctness of the maternal and fetal circulations "was, as Hunter was aware, strictly speaking, not a new discovery" (p. 32), but if justified it robs William of his claim and reveals him in disparaging light. It may well be true, as Teacher held, that William Hunter presented the anatomical proof that the two circulations do not mingle, yet the real question is not whether he presented this proof, but whether he fully accepted it for man, before John, and that does not seem to have been the case. This point is referred to by an anonymous auditor of William's lectures, who recorded him as saying that

> These appearances I first saw in a cat that was pregnant, which I injected from the uterine vessels, after which I injected by the navel string. The injection was distinct; I afterwards saw the same in a bitch. These discoveries were early in life, and taught me to believe that the same course of things existed in the human species, though I could not demonstrate it, not having had an opportunity to inject a pregnant uterus; but soon after I did meet an opportunity, & the appearances staggered me. For after injection of the parts, I found the uterine injection filled up a great part of the placenta &c., which on examination proved to be spongy & cellular. (p. 82.)

Hunter no doubt was "staggered," as well he might have been, because the injections of pregnant human uteri, instead of being unequivocal as in the cat and dog, were confused and seemed to controvert the conclusion reached from injections of the carnivora mentioned. However, according to Needham, "His [William's] injections left no shadow of doubt about the matter, and the way was clearly opened up for the study of the properties of the capillary endothelial membranes separating the bloods . . ." (p. 201.)

BUBONIC PLAGUE OUTBREAK IN SAN FRANCISCO—YEAR 1900[*]

THE first severe test of the competency of United States Public Health Service bacteriologists may be said to have occurred in 1900, when suspected cases of bubonic plague began to come to the attention of the local sanitary authorities in San Francisco. Dr. Joseph J. Kinyoun, formerly the director of the Hygienic Laboratory, was then assigned to quarantine duty at that port. It was his duty to be informed of local health conditions, and he obtained materials from some of these cases and reported that he had confirmed them bacteriologically as plague. The same confirmation followed at the Hygienic Laboratory on specimens which he sent there. There followed one of the most sordid and distressing stories of sanitary annals, lasting over many months, extending to the city and state governments, into local politics, the press, the agencies of the law, and even threatening international complications. It is within the power of a few microscopic plants on a glass slide, granted certain antecedents, to cause such upheavals in the affairs of man. The health agencies appear, from the record, to have come through the mêlée with at least honor unimpaired, but the political agencies and the press made but a poor showing in the cause of public service. Even the law, which we must not criticize, gave an example of how decisions arrived at, presumably in accordance with its rules and traditions, may protect undeserving persons and do the public an enormous disservice.

---

[*] CALIFORNIA AND WESTERN MEDICINE, in the Lure of Medical History department (issues of November, 1938; December, 1938, and January, 1939), presented the story of the San Francisco Bubonic Plague outbreak in a series of articles by George H. Evans, M. D., who was president of the State Medical Association at the time. To supplement Doctor Evans' account, the comments of Medical Director A. M. Stimson of the United States Public Health Service, Washington, D. C., as recently given in Supplement 141 to the United States Public Health Reports, are given place in this February issue.

* * *

To shorten a long and unsavory story and get at the moral quickly, we shall simply give examples of what happened and not attempt a chronological account. The press presented a solid front not only in denying the existence of plague in San Francisco, but in belittling and hamperinng all those who entertained the opposite and true opinion. The City Fathers seconded and inspired the press in its efforts. The commercial powers, including the great Chinese Six Companies, resorted to almost all conceiveable tricks of intrigue, and even violence, to suppress knowledge of the true state of things. Doctor Kinyoun was alternately threatened and offered large bribes to recede from his position. Plots were made to destroy the patrol boats under his jurisdiction which attempted to prevent the smuggling of Chinese—well, sick, and dead—out of the city. The Navy had to be called in to give them protection. An injunction against sanitary interference in Chinatown was granted by a circuit judge. Doctor Kinyoun was cited in contempt of court on trumped-up charges. The Governor of the State accused the health authorities, local and federal, of incompetence and the use of illegal and unfair methods, and denied absolutely the existence of plague. And all this and much more because of the fear that if plague were publicly acknowledged, business prosperity would suffer. And what were the actual conditions? Some 25,000 Chinese lived in the section known as Chinatown. A few of them were wealthy and lived in sumptuous surroundings, but the majority lived under conditions which should never have been permitted on American soil, conditions of overcrowding, squalor, and degradation almost incredible to the eyes of the sanitary squads, when, after many months, they were finally permitted to go in and clean up. In this population, plague had doubtless been smoldering for weeks before the first case came to light; but with all the oriental arts of craft and ingenuity, the prying eyes of the health authorities were kept from seeing what was going on. Sick and dead Chinese were smuggled out of the city or otherwise disposed of so as to keep them from inspection. Persons sick for a day or two with buboes were represented as having been sick for a month with some chronic disease. This was the population which the press and the politicians, the law and business, arose in sanctimonious wrath to protect in its inalienable civil and legal rights. It was estimated that during the period of the injunction some one thousand Chinese left the city in one week, seeking refuge in the surrounding cities, villages, and countryside, from the pestilence which they recognized only too well. Does the chronic infection with plague among ground squirrels involving a large area in California, a constant menace and already the cause of many human deaths, date from this exodus?

* * *

As a final measure to meet this apparently hopeless situation, the Secretary of the Treasury, at the suggestion of the Surgeon-General, appointed a commission of impartial experts—Flexner, Novy, and Barker—to make an independent investigation. Although snubbed by the university where they sought laboratory space, and browbeaten by the Governor, they persisted, and in a short time brought in a verdict of plague (PHB 8, *1901*). Of thirteen deaths investigated, six were found bacteriologically to have been due to bubonic plague. After this, opposition smouldered and finally died out. The Public Health Service was asked to clean up Chinatown, and actually performed this herculean feat, and for the time San Francisco was free from plague.

Of course plague came back to San Francisco. The history of many a progressive and prosperous city, such, for example, as Liverpool, has shown that the infection, once established in the rat population, is difficult to eradicate. During the years, first of desolation and then of recuperation, cleaning up, and rebuilding which followed the San Francisco earthquake and fire of 1906, plague quite naturally reappeared with redoubled vigor. The wreckage of the buildings and sewers, the accumulation of vast amounts of rubbish, the flimsy construction of temporary abodes, the disorganization of food handling and garbage disposal, afforded ideal conditions for rat multiplication. It is instructive to reflect that under such conditions, and in the presence of an abundance of fleas, one old rat with chronic plague could start an epidemic.

* * *

At the time of the earlier epidemic, the Hygienic Laboratory was turning out large quantities of Haffkine prophylactic for use in the plague-threatened areas, this rather than the control of the rat population being considered at that time the chief reliance (AR *1900,* p. 676), and experiments were conducted to determine the viability of the bacillus on various objects (*ibid.,* p. 603).

* * *

During this epidemic a plague laboratory was set up by the Service in San Francisco, which, with the exception of about three years of quiescence, has been maintained in various quarters up to the present time. Here Currie, in 1903, described chronic plague in the rat, since recognized as an important factor in maintaining infection. In the following years, under the direction of McCoy, a great many studies pertaining to the disease were made, dealing with such subjects as the infectibility or resistance of various species of small animals, the pathology of rodents with plague, bacteriological methods, the rôle of various fleas, and the bionomics of rodents. In the latter connection it was found that when *Rattus norvegicus* had been significantly reduced in numbers by the campaign, the other varieties, *R. rattus* and *R. alexandrinus,* rapidly increased, introducing new factors in the control program because of their different habits (AR *1912,* p. 152). It seems unnecessary to refer to these contributions categorically. They were very useful to Service officers in following plague campaigns (New Orleans, Hawaii) and played their part in building up the present-day conception of the disease and its bacteriology. During the New Orleans campaign C. L. Williams showed that routine microscopic examination of rat spleens and livers reveals infection in some cases (35 per cent of total plague rats) not discoverable macroscopically (RPHR 357, *1916*). It is, perhaps, worth recording that in this outbreak, plague rats were not discovered until several thousands of them had been examined, showing how focal the infection may be in such cases. The remarkable retention of viability and virulence of nontransferred agar cultures of the plague organism (nine years) and of the organism in guinea-pig spleens in glycerin at minus 15 degrees Fahrenheit (seven years) is reported by Francis (RPHR 1535, *1931*).

* * *

The antiplague activities of the Public Health Service, in the absence of any recent human outbreaks, have now sifted down to three: Trying to keep shipping free from rats (C. L. Williams, RPHR 1267, *1929*) (Grubbs and Holsendorf, SPHR 93, *1931*), perennial supervision of the so-called plague-free zones around California cities, and the control of rural plague in Hawaii, where the disease is epizoötic in field rats and a new species of fleas, *Xenopsylla hawaiiensis,* appears to be the common transmitter (AR *1933,* p. 9) (Eskey, PHB 213, *1934*).

* * *

While other Pacific Coast cities, besides San Francisco, have been visited by plague, and there have even been small outbreaks of the pneumonic type, the human mortality has, fortunately, been small although rat infection has sometimes been considerable. The history of plague in Seattle has recently been written interestingly and completely by Fricks (PHB 232, *1936*).

* * *

Plague has possibly come to be regarded by Americans as an exotic disease of historic interest only, or at least confined to relatively undeveloped countries and populations. Probably few realize that the disease is firmly entrenched on our own territory, among the ground squirrel population of the far West, and that only by eternal vigilance has it been prevented from invading the rat populations of cities, and from them infecting human beings. While eradication may appear well-nigh impossible, more favorable conditions of attack have been afforded by some of the health provisions of the recent Social Security legislation. Mobile laboratories have been successfully used in locating foci of infection.

CLINICAL NOTES AND CASE REPORTS

TOXIC NECROSIS OF LIVER FOLLOWING USE OF SULFANILAMID*

By Paul Fitzgibbon, M.D.
and
Barney Silver, M.D.
Los Angeles

The literature on sulfanilamid is accumulating so rapidly that we are reluctant to contribute to it; but as far as we have been able to find out, there is as yet no fully described case in which toxic necrosis of the liver has been attributed to the use of this drug.

REPORT OF CASE

The patient was a 37-year-old white, a carpenter, whose medical history previous to his present illness was not remarkable. It included an attack of scarlet fever when he was 12, gonorrhea at 18, and abscesses of teeth and otitis media several years before admission. He also had attacks of numbness and tingling, together with blanching of his fingers during the winter months. These symptoms were relieved by immersing the hands in warm water. Whether these attacks were serious enough to merit the diagnosis of Raynaud's disease is probably unimportant to say. The family history does not seem interesting enough to relate.

He was well then until June 13, 1937, when he noticed a urethral discharge. A smear made at the Los Angeles City Venereal Clinic was positive for gonococci. The usual local treatment for eleven days was without effect, and on June 24, when he still had a frank discharge, and positive smear, as well as uniformly cloudy urine in the three-glass test, he was started on sulfanilamid. The dosage was eighty grains the first day, and the discharge lessened at once. On the third day, when he got sixty grains, the discharge was gone; but the drug was continued for nine days more, by which time he had taken, altogether, 500 grains of sulfanilamid. At this time he began to notice a little weakness and headache, and the drug was stopped. But a few days later, on July 11, he had a few shreds in the urine, and the drug was again started, on a dosage of forty grains a day. At the end of the fourth day the urine became a deep amber, and he developed a generalized maculopapular eruption; limited sharply to those areas which had been exposed to the sun, but sparing the face. He felt ill, had a fever of 101 degrees, but took some magnesium citrate and cascara on his own initiative, and in three days the complaints had entirely disappeared. The blood Wassermann and urethral smear were each negative at this time. The drug was, of course, stopped.

The patient was then followed in the clinic for some time; had a full-sized sound passed, together with silver nitrate instillation of the posterior urethra, and later a trial bout of alcohol and sexual intercourse, without showing anything more than a few shreds in the first glass. The shreds were persistently negative for gonococci.

Then, on the morning of August 25, six weeks after his last dose of sulfanilamid, he thought he saw a little tear at the meatus of his urethra. On his own volition and without seeking advice, he took fifteen grains of the same drug which had been given him at the clinic two months before. Within five hours he developed an urticarial rash, with intense itching and fever. On the third day, the rash had cleared somewhat, but he still felt very weak. Three days later, on September 30, he noticed he was becoming yellow, that his urine was becoming dark, and that his stools were a light gray.

He stayed at home, gradually becoming sicker, until, on September 17, he was finally admitted to the urological service at the Los Angeles County Hospital.

On the ward he was afebrile, had a severe jaundice and looked toxic, but he had no specific complaints. There was

October 8, 1937—Urine deep bile. Stool beginning urobilin positive. N. P. N. 26. Urea nitrogen 8.

October 12, 1937—Urine deep bile. Icterus index 200. Van den Bergh direct prompt, indirect 9.6. Stool urobilin positive. N. P. N. 75. Urea nitrogen 50. Creatinin 3.1.

October 18, 1937—N. P. N. 54. Urea nitrogen 25. Amino acid blood 6.6/100 c.c. Blood sugar 155. E. K. G. Sinus bradycardia and myocardial impairment. Urine amino-acids 1.40 mg./24 hours.

October 19, 1937—Urine mild bile and icterus index 80. Van den Bergh prompt. Indirect 5.1. Stool positive urobilin. N. P. N. 33. Urea nitrogen 15.

no anemia; digestion was satisfactory and, while in bed, he was fairly comfortable. The liver was not palpable or tender.

He remained on the ward for a week essentially unchanged, when he stubbornly decided that he had to go back to work and left, against the advice of the staff. He remained on a high carbohydrate diet, but he did not get along well, and finally got so sick that he again applied for admission to the hospital where, on October 5, 1937, he arrived on the medical service of Dr. John C. Ruddock.

This time he was much more ill; the jaundice was deeper, he had a profound anorexia, and shortly began to vomit. He was still afebrile, and had no anemia. The liver was now felt three fingers below the costal margin, and moderately tender. The right diaphragm was markedly elevated by the hepatomegaly. As can be seen in the accompanying table, he rapidly developed the clinical and laboratory picture of an acute toxic necrosis of the liver. There was some leukopenia. The blood urea was reduced out of proportion to the total nonprotein nitrogen, while the amino-acid nitrogen was not found abnormally high. About one week after admission he was so sick that it seemed he would not recover. At this time he developed some urinary suppression, coinciding with the high nonprotein nitrogen retention noted in the table; but the next day he responded to repeated doses of concentrated intravenous glucose, and from that time on gradually began to improve. This improvement, once begun, proceeded rapidly, and he left the hospital on October 20, 1937, still slightly jaundiced but definitely convalescent.

Table 1 indicates the laboratory work which confirmed the diagnosis.

COMMENT

This, then, is the most alarming complication noted among some 712 patients who have been per-

Table 2.—*Incidence of Side Reactions in Two Hundred Consecutive Cases of Gonorrhea Using Sulfanilamid*

Symptom	Number of Points	Per Cent of Points	Comment
Weakness	72	36	Most frequent but of little significance
Dizziness	67	33	Same
Dyspnea	60	30	Only two cases had to be D. C. on this account
Headache	33	16.5	
Anorexia	32	16	
Drunk feeling	25	12.5	
Sleepiness	22	11	
General aching	19	9.5	
Nausea	19	9.5	
Cyanosis	19	9.5	Oxygen tent for one patient for twenty-four hours
Vomiting	9	4.5	
Fever	8	4	
Rash	11	6.5	About 50 per cent photosensitive
Constipation	6	3	
Diarrhea	2	1	
Paresthesia	4	2	
Cycloplegia—Temporary	0	.5	
Peripheral neuritis	0	0	One case known outside this series
Precordial pain	2	1	
Temporary deafness	2	.5	
D. C. drug due to S. R.	17	8.5	
Urticaria	1	.5	
Toxic necrosis liver	1	.5	One case reported above
Death	0	0	

sonally observed by one of us (B. S.) at the Los Angeles City Venereal Clinic since the use of sulfanilamid was begun there on May 12, 1937. It is not intended to comment on this experience at this time further than to show Table 2, which tells at a glance the variety and incidence of complications that may be expected from an extensive application of the drug.

It seems to us that the most significant feature of this record is the prompt development of jaundice in a patient who took a very small dose of a drug which he had taken in large amounts two months previously. This raises the question of sensitization to the drug in a susceptible patient; an issue which has become familiar in the literature on pyramidon, neoarsphenamin, sedormid, cincophen. The fact that this type of sensitization has not yet been already produced in animal experiments is disappointing to those who have advocated the allergic character of these certain types of drug hypersensitivity, but the possibility of an allergic mechanism is still unrefuted. We have made no studies in sensitization, experimentally or otherwise, with this drug, but we think it important to point out the striking similarity of this record to those which have been described in reports on the harmful effects of pyramidon, neoarsphenamin, etc. We think it is probably worth while to comment also on the fact that our patient exhibited frank signs of injury, *i. e.,* fever, rash, etc., from the original large doses of the drug. Whether this circumstance should be regarded as indicating that he was a likely candidate for the development of sensitization later, we are unable to say. But as a point of practical clinical management, we think it hazardous to assume otherwise, for the present at least, and we venture the suggestion that patients who have shown untoward effects from an initial administration of the drug should be especially guarded against its repetition when sensitization has had time to develop.

SUMMARY

A case of liver necrosis, following the use of sulfanilamid, is reported, and a brief tabulation of the complications of this drug in a series of two hundred cases has been appended.

VITAMINS A, B_1, B_2 AND D: EFFECTS OF DAILY ADMINISTRATION OF CONCENTRATES*

By Florence G. Stone, B.A.
Mira S. Bird, B.A.
and
Hazel E. Field, Ph.D.
Los Angeles

CONSIDERABLE work has been done regarding the efficacy of specific vitamins upon definite diseases, and under carefully controlled conditions. Probably less has been done in observing the general effects of combinations of vitamins employed upon people under normal conditions. The health service of our institutions of higher learning seems to have an unusually good opportunity for such investigations, and accordingly twelve college students between eighteen and twenty-three years of age were carefully selected, during their fall medical examinations, for a test of vitamin therapy. Six men and six women were chosen, but because one of the women failed to coöperate she is not included in this report, except occasionally as in the nature of a control.

STUDENTS CHOSEN FOR THE STUDY

The students chosen were below normal physically and, therefore, presumably of the type most in need of additional vitamins. Nine of the eleven were underweight and undernourished; all were subject to frequent colds, which is a chief cause of trouble for the college student; four had chronic sinus infections; five were subject to influenza; one to pneumonia; and one had had tuberculosis. Two students were subject to hay fever. Acne was present in six students, and dry skin, nails, and hair in one. Five students complained of frequent headaches, and many of them tired easily, both mentally and physically, after less than the normal amount of work. All of these were carrying a full program of college work, and all but two were working outside at various odd jobs, spending in remunerative employment from eight to fifty hours a week, or an average of about nineteen hours. They were found to vary in the amount of sleep they obtained: three averaging about six hours, one seven hours, five eight hours, and two nine hours. It was impossible to control the food taken, but all were eating in the college dining hall and, therefore, under somewhat the same conditions.

These students were then given three capsules daily of a concentrate of vitamins A, B_1, B_2, and D, beginning the middle of November, 1936, and continuing to about the first of March, 1937; and each was checked every two or three weeks, by personal interview, as to any change in conditions, especially weight, appetite, resistance to disease, muscular and mental fatigue, cutaneous conditions, headaches, eyes, and the general sense of well-being. They were also observed for about four weeks after the discontinuance of the vitamin therapy.

Possibly the most noticeable result was the marked decrease in the number of respiratory infections to which the group was by selection predisposed. Three of the students had no colds at all, two had only a slight sore throat, three had slight colds, two had colds of average severity, and only one continued to have colds throughout the winter. This is an excellent record, when we recall that all of these normally had many colds. During the winter there was a considerable influenza epidemic in the area, but in spite of this fact, only one student was mildly affected. In the four cases of sinus difficulty, two were completely cleared of it, and the others were considerably improved. In this connection it might be mentioned that the students having hay fever showed decided improvement, but no study was made of the offending substance supposedly the cause.

---

* From the Health Service and the Department of Biology of Occidental College, Los Angeles.

The A, B, D capsules from the Abbott Laboratories were kindly furnished by them for this experiment.

Table 1.—*Effect of Ingestion of Vitamins A, B_1, B_2, and D on Respiratory Infections of Persons Habitually subject to colds.*

Case	Colds		Influenza		Sinus Infection	
	During	After	Before	During	Before	During

F. G. S.	One light	One average	0	0	Chronic	0
F. S.	One light	0	Subject to	0	Chronic	Improved

* Contracted when neglected to take capsules for one to two weeks.

LATER OBSERVATIONS

After the discontinuance of the vitamin therapy, enough of the previous conditions recurred to indicate that this type of subject was usually not capable of appreciable vitamin storage. From one to three weeks after the administration of the concentrate, five of the group contracted a cold, two developed laryngitis, one had a return of sinusitis, and a fourth a severe case of bronchitis. This latter case of bronchitis was that of a young man in the group, who was working very hard, getting only six hours of sleep. Three students noted a loss of energy when no longer receiving the capsules, but only one of these was in the group having colds. The four remaining students noticed no change in their health, and presumably were able to store the vitamins for at least the period of observation.

It was found that all of the eleven subjects gained in weight during the time of administration of the capsules, but the other student who did not take the vitamins failed to gain. Three gained as much as ten pounds or over. Five of the subjects had an increase in appetite, and those reporting a better appetite were the ones who made the greatest gains in weight. Three students thought they had less appetite at first, until they were accustomed to the capsules.

Less susceptibility to fatigue and a better general sense of well-being were quite noticeable. All of them reported that they felt in better health. Eight of them stated that they did not tire as quickly at physical work as before, while five students believed they were more alert mentally and better able to study.

Several other improvements were noted to varying degrees. Six of the students had been troubled with acne, and all but one were better. One student who had a dry skin, especially on the face and hands, noticed a great increase in oiliness, and his nails were much less brittle. Three others noticed more oiliness of the hair. Two students, whose eyes tired easily, found that they could study longer before feeling any sense of eye fatigue. Of the five students who reported frequent headaches before taking the capsules, one had no headaches, three had fewer headaches, and the other had no decrease in number but a decrease in severity. One student who had gums that bled easily noticed considerably less bleeding and more hardening of the gums while taking the additional vitamins.

We may, therefore, conclude that the ingestion of additional vitamins by a person who is in poor physical condition is likely to bring about a very considerable improvement in general health, especially in resistance to respiratory infections.

Occidental College.

Always Determine Cause of Baby's Crying.—The cause of a baby's continuous crying always should be determined, Ruth Peck McLeod, Knoxville, Tenn., and Hazel L. Creekmore, R.N., declare in their article, "Shall We Let the Baby Cry It Out?" in the January issue of *Hygeia, The Health Magazine.*

There is always a reason for a baby's constantly crying. It may be that he is hungry, in pain, too cold or too hot or is tired of lying in one position. It may be that he is spoiled, though seldom is this the case.

While it is not advisable to pick up the baby every time he whimpers, it is always wise to investigate continued crying. More experienced mothers can interpret the various types of crying, such as the crying from hunger and from pain.

Crying usually increases the infant's complaint. The baby who cries from thirst loses still more water, while the crying of a child who has difficulty in breathing only results in a stuffed-up nose. Babies may expend an astonishing number of calories by crying.

Sleep that comes as a result of exhaustion after crying seldom does a great deal of good.

Hair Straighteners May Cause Burns.—Two cases of intense burns received by Negroes from the use of hair straighteners are cited by Fredric Lewis, M.D., and John V. Scudi, Ph.D., New York, in *The Journal of the American Medical Association* for January 7.

One patient has retained, for seven years, a large depigmented area on the forehead. The other patient, observed recently, will no doubt retain his scars permanently.

Amiable barbers confess that bad burns may result from the imprudent use of hair straighteners. Because of their tendency to burn, their use is inadvisable except with great care or under the supervision of a qualified physician.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

CURRENT QUACKERY

I. DIET QUACKERY

Fletcher B. Taylor, M. D. (3135 Webster Street, Oakland).—Very new countries and very old countries may suffer from food insufficiency. Underpopulation and overpopulation present frontiers of nutrition which have certain points of resemblance. In both instances there may be insufficient food calories to support activity, or even life. In the new occupancy a lack of vegetables may cause scurvy. In the country saturated with people this same lack may develop or there may come general health impairment from insufficient fat-soluble vitamins. Adult osteomalacia developed in Austria during the World War through lack of green vegetables and dairy products.

We who now practice medicine in the United States may find deficiencies in the diets of our patients for a variety of reasons. Poverty is at work in city slums, carelessness may cause trouble at any economic level, and fads in eating may do harm especially in people of fanatic mind. Besides these factors there is a commercialism which uses the diet sheet as its medical reason for existence. Practitioners of this motive broadcast and write for newspapers. There is much opportunism in advertising. Any company producing foodstuff can win the eye or ear of its buying public by making claims which suggest medical approval. The citizenry listens, reads and spreads the information further. Ultimately the information thus obtained is recited by patients in our offices. There is talk of combinations of foods, of drastic plans for reducing weight, of miraculous cures of serious illness by diet plans. Instead of supinely absorbing this lay effluvium, it behooves us to quarry our information from food authority. Some of the current interest in nutrition is due to real research advance.

Scientifically, a consideration of diet is often necessary; practically, a mention of diet is usually requisite in any constitutional disturbance. We must be patiently willing to provide "normal diets" to those who want such lists, even though their specific treatment does not require this information. The first question from the patient's relative or friend is, often, "What diet did the doctor prescribe?" If our advice to patients is to be worthy, it must rest upon active contact with good sources of information.

The human being is omnivorous. The fads which require patients to eat protein, fat, and carbohydrate separately have no basis in fact. We must guard against deficiency of calories and deficiency in food accessories in our patients. If the patient is undernourished, we must consider his problem from the standpoint of total calories eaten. Furthermore, the undernourished individual is more liable to avitaminosis than the well-nourished person. Question such a patient on food habits and fads, and on his family traditions of eating. Trace quantitative and qualitative defects to his period of growth if possible. Correct any such which may be discovered. Work toward well-established normal weight averages,[1] and body-build averages during the growth period.[2]

Look for vitamin deficiency in dermatoses, in persons with indolent pyogenic infections, in the night-blind, in hemorrhagic persons, in patients with neuritis, in those with impairment of heart function, in the rachitic, in the patient with irritable colon or with kidney stones. These and other conditions may rest in whole or in part upon inadequate vitamin intake. Vitamin deficiencies are well discussed in the text by Leslie J. Harris, entitled "Vitamins in Theory and Practice" (Cambridge University Press, 1937). Mineral deficiencies should be suspected in rickets, in tetany, and in abnormal bone fragility. The undernourished and underdeveloped person may not eat enough mineral. Schmidt and Allen discuss this subject of mineral metabolism ably and readably in their recent text, "Fundamentals of Biochemistry" (McGraw-Hill Book Company, 1938).

We must guard against deficiencies of quantity or quality of food in diabetes, in allergic persons who have been put upon exclusion diets and in the poor and indigent. While we consider faults of supply we must also consider faults in delivery to functioning tissue, absorption of food from the digestive canal, internal chemical processes, and in endocrine disturbances; but here we are considering external supply only. The food deficits of war time are like those of overpopulated countries. Interesting accounts which correlate these deprivations are those by Cleon Mason[3] and E. V. McCollum.[4] Of collateral interest is a presentation of food costs by Michael M. Davis, who considered the problem of feeding underpaid city dwellers.[5] Alonzo E. Taylor is co-author in an outline of the problem of feeding the world.[6]

It is surprising that we have so little recognized dietary deficiency, but the human organism can be wonderfully adaptable to abnormal conditions. Successful life on the remarkable diets of former diabetic regimens are in point. Voluntary rationing in and out of wartime is very illuminating.[7]

Stefansson's famously successful meat-and-fat diet is surprising in this regard. These recorded experiences are reassuring on the adaptability of humankind to special conditions, but should not encourage a blind confidence as we prescribe for patients.

In dealing with the individual patient across the desk or in the hospital, we gain help from the "Compilation of Diets" by the California Dietetic Association (Spanish-American Institute Press, Gardena, California, ninth year). The Department of Household Science of the University of California furnishes a list of recent progressive texts upon the various special problems of nutrition. A sensible dietitian may be consulted with great help. Dietitians are beginning to construct diet plans in which there is quiet conformity to scientific need in really attractive menus. The pleasure of eating is still a consideration in this country.

With the above and similar sources of information, we may guard against diet quackery in ourselves and others.

* * *

II. COSMETIC QUACKERY

Samuel Ayres, Jr., M.D. (2007 Wilshire Boulevard, Los Angeles).—Eternal youth, like perpetual motion, is a goal which the frailty of human understanding has never permitted mankind to acknowledge as being unattainable. It is a worth while and laudable desire for one to look one's best. In so far as the use of cosmetics can contribute to this end, they serve a useful purpose. The extent to which they should be used depends upon the rules of good taste. The desire on the part of the public for the unattainable, and the facility on the part of cosmetic manufacturers and distributors to promise the unattainable, constitute a vicious circle which becomes so vicious at times that serious injury or death may be the outcome.

Cosmetic manufacturers and beauty shops have enjoyed far too great an immunity from regulations which govern the ordinary preparation and dispensing of drugs on the grounds that cosmetics are neither foods nor drugs and, therefore, should not be regulated by pure food and drug laws, and that beautifying the body does not constitute the practice of medicine.

As the result of such loopholes, an enormous amount of quackery has developed. It would be bad enough if it were only a matter of selling "skin foods" that failed to nourish or hair growers that failed to produce a crop. Much more serious consequences of what might be called cosmetic racketeering not infrequently come to the attention of dermatologists. Cosmetic quackery can very easily be roughly divided into minor and major quackery, and all of these quackeries depend upon three factors: the desire of some of us to be good looking; the desire of some of the rest of us to exploit this desire either honestly or dishonestly; and, finally, the almost complete ignorance of both parties to the exploitation of fundamental facts of physiology.

1. "Skin foods," "nourishing creams," and "wrinkle removers." In the first place, wrinkles may be caused by three main factors: senility, with an associated atrophy of fat tissue, elastic tissue and a general thinning of the dermal structures, with a consequent redundancy of the overlying epithelium which falls into folds; appreciable loss of weight from illness or other causes, resulting in a relaxation and wrinkling of the epidermis following the disappearance of underlying fat; excessive dryness, which causes a very superficial, fine wrinkling especially about the mouth.

There is no physiological evidence whatever that substances rubbed into the skin nourish the skin at the point of application. On the contrary, all authorities agree that any fatty or nourishing substances thus applied to the skin are absorbed by the lymphatics and transported to other parts of the body, where they undergo the same processes of digestion and assimilation as though they had been taken by mouth. If the term "lubricating cream" were substituted for the term "skin food," there would be no criticism. Inasmuch as suitable fatty or lubricating substances soften the skin when it is dry and rough, they perform a useful function and constitute a legitimate cosmetic. But "skin food" seems to promise so much more and, psychologically, certainly has a much stronger sales appeal! There is no scientific foundation for the claim that hormones incorporated in creams can change the quality of the skin, and the fact that people are willing to pay exorbitant prices for such preparations is eloquent testimony to the ignorance of the public and the cupidity of the manufacturers.

2. Skin cleaners, cleansing creams, etc. Cleansing the skin should be, and in fact is, a relatively simple matter. Warm water and soap which is free of excess alkali and medication constitute the ideal cleansing medium. Soap dissolves or mechanically removes dirt, excess oil either naturally produced or cosmetically applied, and various other substances from the surface of the skin. If the coating of cosmetics is unusually heavy, it can first be softened with cold cream and then washed off with soap and water. The day's accumulation of natural sebum, dirt, powder, rouge, cream, etc., can be effectively removed only by the use of soap and water. The sebaceous orifices become clogged with such débris and, while it is true that "cleansing" creams will remove dirt from the skin surface, they cannot adequately cleanse the pores. On the contrary, rubbing "cleansing" cream on the face adds to the accumulation already clogging the sebaceous outlets.

The author has for a number of years been interested in a clinical disorder which affects the face chiefly in women, and especially those who have substituted "cleansing" creams for soap and water. The condition is characterized by a dryness and roughness of the face, the roughness being due to the plugging of the sebaceous pores by innumerable tiny scale-like plugs which feel like the surface of a nutmeg grater. In addition to the dryness and roughness, there is more or less redness, and sometimes superficial vesicopustules, constituting a veritable acne rosacea. These patients complain a great deal of burning and irritation, which is not relieved by any sort of soothing cream or ointment. If several of these dry follicular plugs be picked out with fine-pointed forceps, or a drop of the fluid from one of the vesicopustules be removed on the point of a narrow scalpel, and placed on a glass slide and covered with a cover slip after the addition of a drop of 40 per cent KOH, and then examined under the low power of the microscope, one is apt to find enormous numbers of Demodex folliculorum, a small animal parasite, normally present in small numbers in the upper portion of the sebaceous ducts on the face. Under normal conditions these parasites apparently act as scavengers, subsisting on sebum, and cause no irritation, but in the absence of soap and water cleansing, and especially with the abundant use of cosmetics, living conditions seem to become more favorable for these organisms, which multiply rapidly. I have counted as many as sixteen Demodex within a single follicular scale in a low-power microscope field, lying side by side and looking almost like sardines packed in a can. These organisms are never found in such numbers in normal skin nor in any other dermatosis of the face such as acne vulgaris, impetigo, sycosis vulgaris, etc. The above described entity might very properly be designated as "cosmetic skin." As further evidence that this condition is caused by improper cleansing of the skin, with a resultant expansion of the Demodex colony, one need only observe the rapid disappearance of the disorder following the institution of daily washing with soap and water, followed for a few nights by the application of a compound sulphur ointment, such as Danish ointment, which appears to be as effective in killing Demodex folliculorum as it is in destroying acarus scabei. For tender skins, a little simple cold cream applied after washing with soap and water would be of value.

Other types of cleansing agents have been advertised. One, a liquid, appears to contain a rather sizeable percentage of phenol, judging by its odor which persists for many minutes after an application. The daily absorption of phenol, which is rubbed into the skin over an indefinite period of time, certainly carries the danger of kidney damage. Strongly medicated soaps have little, if any, therapeutic value, and certainly offer ample opportunity for local irritation.

3. Depilatories. The growth of superfluous hair, especially on the face in women, is frequently a source of embarrassment and, if heavy, is a disfigurement and may be a serious handicap, both psychically and economically. The only safe and effective method of *permanent* removal is by means of electrolysis. When properly performed, good results can be obtained. For a number of years, and possibly even now in some states, x-rays were employed for this purpose. Qualified dermatologists and roentgenologists have long recognized the fact that a dose of x-ray sufficient to destroy the hair follicles would also destroy other structures of the skin such as elastic tissue, sebaceous glands, etc., resulting in a chronic roentgen dermatitis, giving the effect of a prematurely senile skin with the dangers of malignant degeneration. In spite of these facts having been definitely established for twenty years or more, certain "beauty" charlatans have continued to advertise and to administer x-rays for such an illegitimate purpose, with the result that all x-ray therapy is falling into disrepute in the minds of many laymen, and hundreds of women have had their faces permanently disfigured. It is true that ultimately such abuses are corrected more or less, here and there, but there is always a long period of time, sometimes from ten to twenty years, during which irreparable harm is done, to the enrichment of the unscrupulous.

Another vicious depilatory was put on the market several years ago, while advertised in metropolitan newspapers by leading department stores. This substance was a cream which could be bought by anyone, and carried no word of warning that it contained a deadly poison—thallium acetate—which, in other forms, has been widely used as a rodent exterminator. Absorbed through the skin, this cream not only caused the hair to disappear locally, but also in many cases resulted in baldness, blindness, paralysis, and death.

Of the more commonly used depilatories, some consist of a wax which is melted, applied to the skin and allowed to harden. It is then pulled off, pulling with it the hairs which have become embedded in the solid mass. "It's off, because it's out," is true as far as it goes; but pulling the hair out, whether done by wax or by tweezers, does not destroy the growing part of the hair, in spite of the statement of the manufacturer that continued use of the product tends to discourage the growth of the hair. Other depilatories contain barium sulphid, which dissolves the hair shaft a little distance below the surface of the skin but does not accomplish much more than shaving. Provided one is not sensitive to barium sulphid, there is as yet no known contraindication to using such a preparation. If the growth of superfluous hair is truly excessive, the advice of an endocrinologist should be sought.

4. Antiperspiration cosmetics. The use of preparations under the arms for the purpose of inhibiting perspiration or disguising its odor is usually without harm, unless one happens to be sensitive to some ingredient in the cosmetic, which not infrequently happens. Aluminum chlorid, oxyquinolin sulphate, formaldehyd, formic acid, salicylic acid, thymol, etc., are some of the active ingredients in such preparations, which are capable of exciting a dermatitis. Once a dermatitis has developed, secondary pyogenic infection often supervenes, with the formation of multiple painful furuncular lesions of the sebaceous and large sweat glands. None of these preparations exert any permanent remedial action.

5. Hair restorers. The high percentage of baldheaded men, even among the dermatological profession, is ample testimony of the inadequacy of most of our methods for growing hair. The claims of most hair tonic manufacturers and hair-growing "systems" rank near the front in optimism, but usually bring up in the rear in performance. The truth of the matter is that no one knows the cause of premature baldness. Male, sex-linked racial and hereditary factors are probably of great importance. Toxic influences, such as acute and chronic

illness (alopecia following influenza, scarlet fever, occasionally in syphilis), possibly toxic absorption from chronic foci of infection in certain cases, chemical toxins such as arsenic and thallium, mechanical obstruction to scalp circulation from tight-fitting hats on rounded or oval heads, local infection of seborrheic dermatitis, endocrine disorders such as hypothyroidism with dryness and thinning of the hair—one or more of these factors, and doubtless others of undetermined nature, probably account for baldness. No experimental work of any value has been offered to show that external applications can stimulate the growth of hair except in cases of alopecia areata, where irritants, especially ultraviolet light in brisk doses, apparently is of some value in cases of not too great extent or of too long duration. Preparations containing sulphur, salicylic acid, etc., which are capable of controlling the infective process in cases of seborrheic dermatitis, are probably of value in arresting hair loss. It would probably be conservative to say that nine-tenths of the claims of hair-growing preparations and "systems" are unwarranted.

6. Face rejuvenators. These preparations range all the way from mild "astringents" to clay packs, to face peels, to subcutaneous injections of paraffin for the removal of wrinkles. The milder "astringent" preparations are usually harmless and may give temporary benefit by setting up a mild superficial inflammation of the skin, with slight swelling, thus causing enlarged "pores" or sebaceous orifices to appear smaller. Alcohol, alum, witch hazel, benzoin, glycerin, menthol, etc., in various combinations usually make up such preparations. They do not cause any actual contraction of the sebaceous openings, and their effect, if any, is very transitory. The only effective method of actually reducing the size of enlarged sebaceous orifices, which is usually due to overactivity of the sebaceous glands, is to depress the activity of these glands by small, divided doses of x-ray in the hands of one qualified to use this agent in the treatment of skin disorders. Digestive and dietary factors should not be overlooked. Alcoholic stimulants usually cause a reflex flushing of the face, with an accompanying overstimulation of the oil glands.

Clay packs give a feeling of luxury and comfort, but no scientific evidence has been adduced to indicate any therapeutic effects worthy of note.

Face peels are supposed to remove "blemishes," wrinkles, scars, etc. Exfoliation induced by ultraviolet light is relatively superficial in its effects, is usually harmless, unless a severe burn is produced, and is likewise usually of little therapeutic value, although some benefit may at times be noted. Deep peeling, such as follows the use of certain chemical "face peels," is positively dangerous, and cases of permanent disfigurement, and even death, have been recorded from its use. Resorcin, sulphur, betanaphthol, etc., which are sometimes used, may cause a severe dermatitis, when phenol and other more dangerous ingredients are known to have been employed.

The subcutaneous injection of paraffin for the purpose of smoothing out wrinkles was at one time more widely employed than at present. The paraffin, being nonabsorbable, remained in the tissues, frequently setting up inflammatory reactions in the connective tissue with resultant paraffinomas, tumor-like swellings which frequently blocked lymph drainage, thereby causing edema, tumor masses, discoloration and, in general, a permanent and horrible disfigurement for which there is no known relief.

7. Bleaches, dyes, rouge, powder, etc. Space does not permit detailed consideration of all these cosmetics, but a few words will point out some of the hazards.

Many bleaches and freckle removers contain mercury, sometimes in dangerously high percentages. If there is no immediately irritating effect there may be toxic injury from absorption, if used over a long period of time, and in occasional cases the long-continued application of mercury creams results in a slate-gray pigmentation similar in appearance to argyria.

Hair and eyelash dyes occasionally produce a severe dermatitis or conjunctivitis. Anyone contemplating having his hair dyed should have a patch performed first to determine if sensitivity to that dye exists. This does not, however, insure against the subsequent development of a sensitivity with continued use of the dye. Paraphenylendiamin has resulted in blindness in a number of cases in which it was used to dye eyelashes, and occasional cases of severe dermatitis have followed its use on the scalp. Lead and silver are used in some dyes. Even henna has been known to cause local irritation.

Certain face powders at one time contained lead, but probably the great majority of powders on the market at present are free of injurious ingredients, unless one is sensitive to orris root, rice powder, or some coloring or perfume which may be present.

Lipstick and rouge are also usually harmless, except for the occasional case of sensitivity to some ingredient. Certain liquid nail-polish preparations may cause a dryness and splitting of the nails, due to the solvent action of acetone, etc.

In conclusion, let it be said that the use of cosmetics has a legitimate place in modern civilization. When tempered by the rules of good taste, the judicious use of cosmetics should enhance personal appearance, and cleanse and protect the epidermal coverings of skin, hair, and nails. Anything beyond this properly belongs in the field of medicine. If it were possible to eliminate the fraudulent claims and the worthless or dangerous preparations, there would be no quarrel. The public is entitled to this protection and it must be forthcoming. The Federal Trade Commission is one agency which is working on the problem, and should be sympathetically supported.

* * *

III. SUGGESTED REMEDIAL MEASURES

H. M. F. Behneman, M.D. (450 Sutter Street, San Francisco).—To outline remedial measures designed to end quackery is an easy assignment. To enforce and actually curb quackery is indeed a difficult problem. For a hundred years we really have been trying to accomplish this end in medicine; yet new cults are constantly springing up, and old ones—parasites clinging to the cloak of medicine—are still with us. Probably no one in our State Medical Society is more alert to the situation than our able Medical Board secretary, Doctor Pinkham. His opinion is that the only real, potent, lasting remedy is education of the public.

This, he feels, is possible, and will eventually bring the greatest results. Such education, however, must start in the primary schools—it must start with the growing child. He must be given enough knowledge of elementary physiology and hygiene so that he will, as he grows older, naturally seek medical care from those he feels are qualified to "know whereof they speak." Meanwhile our efforts to reach the adult mind must go on by radio, by print, and by word of mouth. Teach the growing child and the grown-up enough about the basic sciences to enable him to judge who is best qualified to treat his ills.

My own ideas center around legislation. I have felt the Basic Science Law is a panacea par excellence. However, it is only effective if no initiative measure or law exists in the state. Legislative enactment would not be effective in such a situation. In other words, such a law must become a law by a vote of the people. A certain (and large) percentage of those who voted in the previous election must vote "Yes" on such a measure to place it in our statutes. This is not only difficult in California, but costly. Thirteen states now enforce a Basic Science Law. Such a law determines whether a person is well enough informed in the five sciences fundamental to all methods of healing. Our present method of three separate examining boards only causes confusion. Too often they fail to enforce their own acts, and the result is the State Board of Medical Examiners has to step in and prosecute.

To control charlatanism by hospital coöperation, etc., is useless, because the cultists are building their own, such as the Bellevue Hospital in Los Angeles. May I meekly suggest that we emerge more often from the smug stronghold of our superethics to inform the public better as to why they should seek a physician and not a cultist! We cannot ignore the fact that salesmanship and advertising have turned millions into the cultists' waiting arms. Hippocratic medicine has nothing to hide and much more to give. We should use every approved method to inform the public, particularly now when we are on the threshold of socialized medicine, with the *laity* hard at work on plans for *our* future.

Inform the growing child, interest your patients in its importance; then, perhaps, in a few years we can successfully vote a Basic Science Law into California.

The Indictment of the American Medical Association.—Last week *The Journal* published the complete text of the indictment of the American Medical Association and other defendants, in the District of Columbia, by a grand jury which, for some weeks, had heard a mass of evidence presented to it by attorneys from the Department of Justice, *The Journal of the American Medical Association* for January 7 says in an editorial.

Elsewhere in the current issue of *The Journal* appears a chronology of this case from the time when the so-called Group Health Association, Inc., first appeared on the scene in the District of Columbia to the time when the grand jury made its report. Also in the Organization Section will be found a number of editorials and cartoons which have appeared in newspapers throughout the United States indicating, as far as such pronouncements can indicate, the public reaction to this extraordinary indictment.

At the special session of the House of Delegates which was held in Chicago in September, the Board of Trustees of the American Medical Association, anticipating the Government's activities, presented a consideration of the possibility of an indictment. This matter was referred by the House of Delegates, as is customary, to a reference committee and the report of the reference committee was unanimously adopted by the House of Delegates. This report authorized the Board of Trustees to employ suitable legal counsel and to carry this matter even to courts of last resort in order to determine the issue.

Apparently the press of the United States finds it impossible to separate the activities of the Department of Justice from the proposal of a vast expansion of medical service under governmental control. Thus Gerald G. Gross, in the Washington *Post* of December 25, writes: "A convincing case can be built up to support the theory that the extraordinary grand jury study was, to put it bluntly, propaganda looking forward to Congressional consideration of the proposed National Health Program."

The commentators in the American press, including even those newspapers which have been most persistent in the campaign for new methods in medical practice, have been well night unanimous in their opinion that the action of the Department of Justice under Mr. Thurman Arnold was the wrong way to achieve the objective if that objective is to be achieved. Certainly this legal procedure can do nothing to solve the problem of medical care. It is a pity that the Federal Government, including its executive, investigate and a considerable number of other departments should have embarked on a procedure which is inclined to cast public discredit on a great profession and to impugn the motives of workers in that profession. Moreover, a suitable defense will cost the Association a considerable sum of money that in the ordinary course of events would have been spent for the advancement of the science and art of medicine and the protection and promotion of public health. The time may yet come when those representatives of our government who have been chiefly responsible for initiating, conducting and manipulating this performance with all of its far-flung manifestations will review regretfully the part they have played in this incident.

"Digestion" of Food Starts With Cooking.—The process of digesting your food starts while this food is being cooked, declares Hyman Goldstein, Ph.D., West Coxsackie, New York, in his article entitled, "Enzymes—Dictators of the Digestive System," in the January issue of *Hygeia, The Health Magazine.*

This "digestion" process starts with the breaking down of the complex protein, carbohydrate and fat molecules due to the action caused by application of heat when the food is placed on the stove. The process is then continued in the body after the food is eaten. The temperature of the body and the ever-present water in the juices of the digestive tract help to complete the breakdown.

The enzymes in the digestive juices speed up this simplification process. While their presence helps the digestive process along, they themselves do not enter into the reaction and are not used up. The enzyme may be likened to a spark that sets off an explosion, but unlike the spark it does not vanish when the reaction or explosion is over.

After the food is digested, it is probable that the enzyme, which is unchanged, is absorbed with the digested food by the body. It is also probable that the enzyme can be used over and over again. A minute quantity of enzyme can bring about chemical changes in large quantities of food. It must be made clear that enzymes merely accelerate the whole process of breaking down the food particles.

The first wealth is health. Sickness is poor-spirited and cannot serve anyone; it must husband its resources to live. But health answers its own ends, and has to spare; runs over, and inundates the neighborhoods and creeks of other men's necessities.—Emerson.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

COUNCIL OF THE CALIFORNIA MEDICAL ASSOCIATION

Minutes of the Two Hundred and Seventy-First Meeting of the Council of the California Medical Association

Meeting was held in Room 209, Sir Francis Drake Hotel, San Francisco, Saturday, January 14, 1939, at 9 a. m.

1. **Call to Order.**—The meeting was called to order by Chairman Schaupp with the following members present: President William W. Roblee, President-Elect Charles A. Dukes, Past President Howard Morrow, Speaker Lowell S. Goin, Chairman of Council Karl L. Schaupp; Councilors Calvert L. Emmons, Louis A. Packard, Axcel Anderson, Alfred L. Phillips, Oliver D. Hamlin, P. K. Gilman, F. N. Scatena, Henry S. Rogers, T. Henshaw Kelly, William H. Kiger; Chairman of Public Relations Committee George G. Reinle, Secretary-Editor George H. Kress, General Counsel Hartley F. Peart, and his associate, Howard Hassard.

Absent: C. O. Tanner, abroad; Carl R. Howson and Harry H. Wilson, because of illness.

2. **Minutes.**—The minutes of the 270th meeting of the Council were presented and on motion of Howard Morrow, seconded by William Kiger, were approved.

3. **Pneumonia Control Committee.** — Discussion was had of the payment of transportation expenses of members of committees.

It was moved by William Roblee, seconded by Calvert Emmons, that the Chairman of the Subcommittee on Pneumonia Control be invited to be present at the Conference of County Society Secretaries and Standing Committees, to be held on Saturday, February 18. Carried.

4. **Trustees of Indemnity Defense Fund.**—On nomination by Howard Morrow, seconded by Charles Dukes, and ballot duly cast, J. B. Harris was elected trustee of the Indemnity Defense Fund for a period of three years, term expiring 1942.

5. **Special Session Costs.**—Secretary Kress reported that the cost of the special session of the House of Delegates to date was $4,557.15. (Transportation, $2,316.95; per diems to delegates, $1,050; mimeographing tentative drafts, $544.44; ediphone reporting, $232.40; miscellaneous, $413.36; reports from three delegates not yet received.)

6. **Audit.**—The Secretary reported that the certified public accountants were at present preparing an audit of Association accounts for the year 1938.

7. **Contribution from a Delegate.**—The Association Secretary stated that a delegate had returned the check to the Association, which had been sent to him to cover transportation expense for attendance at the special session in Los Angeles.

It was moved by Howard Morrow, seconded by William Kiger, that the Association Secretary be given power to act. Carried.

8. **Retired Membership.**—The San Francisco County Medical Society having recommended for retired membership Dr. Alexander T. Leonard, it was moved by William Roblee, seconded by William Kiger, that Alexander T. Leonard be granted such membership in the California Medical Association. Carried.

9. **Annual Session.**—Upon request for instructions from the Committee on Program for Del Monte Annual Session, to be held May 1 to 4, 1939, the consensus of opinion of the Council was that a portion of the first general meeting should be devoted to a discussion of the medical service plan as contemplated by the California Physicians' Service.

It was moved by Howard Morrow, seconded by William Kiger, that Dr. Rock Sleyster, President of the American Medical Association, be invited to address the members of the California Medical Association. President Roblee was instructed to extend the invitation to Dr. Rock Sleyster.

The Secretary stated that other invited guests for the annual session as selected by the Committee on Scientific Work were Dr. Chester Keefer of Boston, Dr. Stuart Harrington of the Mayo Clinic, and Dr. Victor Portman of the Cleveland Clinic.

It was moved by George Reinle, seconded by William Kiger, that the recommendations of the Committee on Scientific Work in regard to invited guests be approved. Carried.

10. **Prizes for Scientific Exhibits.**—The Committee on Scientific Work suggested that the cash prizes for scientific exhibits be discontinued and that in lieu thereof three engrossed certificates (one for excellence. the others for honorary mention) be awarded.

Upon motion duly made and seconded, the recommendation of the Committee on Scientific Work was adopted.

11. **Entertainment at Annual Session.**—It was moved by William Kiger, seconded by A. E. Anderson, that the question of allocation for entertainment at the president's

---

† For complete rosters of officers, see adv. pages 2, 4 and 6.

dinner be referred to the Chairman of the Auditing Committee and the Association Secretary. Carried.

12. **Association of Western Hospitals.**—It was moved by Lowell S. Goin, seconded by William H. Kiger, that the Secretary advise the Association of Western Hospitals that the California Medical Association would suggest a speaker for its meeting in Seattle, provided the transportation and hotel expense of such speaker were paid by the Hospital Association.

13. **Delegates.**—A letter from the San Francisco County Medical Society requesting that the names of delegates and alternates be printed as submitted by the Society in the order of number of votes received, with numbers of votes received by each, in lieu of the alphabetical arrangement in use during the last several years, was presented for consideration. The difficulties were pointed out, if this method were applied to all county societies. It was agreed that the listing as recommended by the San Francisco County Society should be used for that component unit, as per its request.

14. **Death of Citizen.**—The Secretary presented a letter asking for an investigation of the death of a citizen of San Luis Obispo. It was suggested that the communication be referred to the Division of Vital Statistics of the California Board of Public Health.

15. **Cancer Campaign.**—Doctor Dukes stated that the Cancer Commission desired the approval of the Council of the participation of the Woman's Auxiliary. The Council saw no objection to such participation if carried on under the direction of the Cancer Commission.

16. **Executive Committee.**—It was moved by William H. Kiger, seconded by C. L. Emmons, that all items on the present Council docket not receiving consideration at this meeting be referred to the next meeting of the Executive Committee. Carried.

17. **Medical Service Plan — California Physicians' Service.**—Dr. Charles A. Dukes presented the report of the special committee on medical service plans in which the work of the committee, subsequent to the special meeting of the House of Delegates in Los Angeles December 17-18, 1938, was summarized. Doctor Dukes also presented the report of General Counsel Peart and Associate Counsel Howard Hassard to the committee, the Articles of Incorporation of California Physicians' Service as revised by the General Counsel, and the proposed by-laws of California Physicians' Service as revised pursuant to the recommendations of the House of Delegates.

Consideration was then given to each item contained in the report of the special committee.

Doctor Dukes reported that each of the councilors and officers of the Association are to become the first administrative members of California Physicians' Service and that by two-thirds vote of all members, additional administrative members could be chosen from the membership of the Association. Thereupon, by the affirmative vote of all councilors and officers present, the following members of the California Medical Association were elected to administrative membership in California Physicians' Service to join with the members of the Council in incorporating the new corporation: Ray Lyman Wilbur of Stanford University, Dewey R. Powell of Stockton, W. Earl Mitchell of Berkeley, John C. Ruddock of Los Angeles, Fred B. Clarke of Long Beach, John W. Green of Vallejo, S. J. McClendon of San Diego, C. Kelly Canelo of San Jose, Alson R. Kilgore of San Francisco, Samuel Ayres of Los Angeles.

Communications from the American Medical Association were presented to the Council and upon motion of Doctor Packard, seconded by Doctor Morrow, Doctors Leland and Woodward were thanked for their interest and offer of coöperation.

Returning to the report of the special committee, Doctor Dukes stated that the House of Delegates had adopted a resolution authorizing a loan in the maximum amount of $15,000 to California Physicians' Service and that under the constitution of the California Medical Association, it was necessary for the Council to approve the resolution of the House of Delegates. Thereupon, upon motion of Dr. Lowell S. Goin, seconded by Dr. George G. Reinle, and unanimously carried, the following resolution was adopted:

> *Resolved*, That this Association, California Medical Association, loan and advance to California Physicians' Service, the California nonprofit medical service corporation about to be formed, sums not to exceed in the aggregate the sum of Fifteen Thousand ($15,000) Dollars, without interest, and that said loans be evidenced by the promissory notes of said corporation, payable one year after date; and be it
>
> *Further Resolved*, That the officers of this Association be and they are hereby authorized, empowered, and directed to carry this resolution into effect.

The Council proceeded with its consideration of the report of the Special Committee on Medical Service Plans. Mr. Peart stated that the preamble to the Articles of Incorporation had been revised since the meeting of the House of Delegates and the preamble as revised was thereupon read and approved.

Mr. Peart stated that the law requires articles of incorporation to set forth the name of the corporation to be formed, the county in which the principal office is to be located, the number and names of the first board of trustees and the authorized maximum number of administrative members. Therefore, the Council proceeded to consider and determine the various matters thus stated to be required by law.

(a) *Name.*—It was moved by Doctor Goin, seconded by Doctor Kelly, that the name "California Physicians' Service" be approved and adopted. Carried.

(b) *Principal Office.*—It was moved by Doctor Goin, seconded by Doctor Morrow, that the county in which the principal office of California Physicians' Service is to be located be designated as the city and county of San Francisco. Carried.

(c) *Maximum Authorized Number of Administrative Members.*—It was moved by Doctor Goin, seconded by Doctor Morrow, that the authorized number of administrative members be set at a maximum of seventy-five. Carried.

In reply to inquiries, Mr. Peart stated that the administrative members of California Physicians' Service will have the sole and exclusive voting power in the corporation and as such, voting members will from time to time elect the board of trustees and that the board of trustees will be charged with the management and supervision of the organization. Mr. Peart also stated that administrative members will have the exclusive right to amend the Articles of Incorporation from time to time if such becomes necessary and with the trustees will have the right to adopt, amend and repeal the by-laws. Mr. Peart stated that administrative members would undoubtedly be required to remain in contact with professional members in their respective administrative districts, but that their duties would not require an undue amount of time and that, after the first year, it would only be necessary to hold one general meeting of administrative members per year.

(d) *Board of Trustees.*—Doctor Dukes reported that the special committee recommended a board of seven trustees. Thereupon, it was moved, seconded and carried, that the number of trustees be fixed at seven. The following members of the Association were then submitted by Doctor Dukes on behalf of the special committee as the first board of trustees: Ray Lyman Wilbur, Stanford University; C. Kelly Canelo, San Jose; W. Earl Mitchell, Berkeley; T. Henshaw Kelly, San Francisco; Alson R. Kilgore, San Francisco; Lowell S. Goin, Los Angeles; Samuel Ayres, Los Angeles.

On motion duly made, seconded and unanimously carried, each of the foregoing members was elected a trustee of California Physicians' Service.

Chairman Schaupp then designated members of the Council immediately to communicate with each of the above selected trustees to communicate to them the action of the Council and to request their acceptance. The Council adjourned for five minutes and, upon reconvening, it was announced that each of the members selected as trustees had been notified and had accepted.

Association Secretary Kress was then instructed to notify each of the members of the Association selected as administrative members by the action of the Council by telegraph and to request their acceptance of administrative membership in California Physicians' Service.

(e) *Invitation to Be Extended to Representative Californians to Become Administrative Members.*—After discussion it was the sense of the Council that a selected group of persons who are not members of the California Medical Association should be invited to become administrative members of California Physicians' Service. It was moved by Doctor Morrow, seconded by Doctor Goin, that a committee be appointed by the Chairman to canvas the councilors present and to suggest names of nonmedical Californians for the consideration of the Council. Carried.

The Chair appointed Doctors Roblee, Gilman, Kiger, Reinle, and Rogers.

On behalf of the special committee appointed by Chairman Schaupp, Doctor Roblee then submitted a suggested list of names of lay citizens for invitation to become administrative members of California Physicians' Service. . . .

(f) *Revised By-Laws.*—The proposed by-laws of California Physicians' Service, as revised to incorporate the various recommendations made by the House of Delegates, were then presented to the Council for its consideration. Each of the sections of the proposed by-laws which had been changed in any manner from the tentative draft presented to the House of Delegates, was then read to the Council and discussed.

Mr. Peart stated that, in accordance with the recommendation of the House of Delegates, the manner of selecting and electing administrative members had been changed so that administrative members would hereafter be elected by the professional members by administrative districts, the number of administrative districts to be not less than ten and not more than thirty. After discussion, it was determined that each administrative district should be entitled to two administrative members. As thus revised, this portion of the by-laws was approved.

The Council continued with a consideration of various portions of the by-laws. Mr. Peart stated that those sections which were routine and which had been left blank in the tentative draft submitted to the House of Delegates, had been completed and, as completed, said sections were read to the Council.

Thereupon, by motion duly made, seconded and carried, it was determined that the proposed by-laws, as now revised, be forwarded to the board of trustees of California Physicians' Service upon incorporation of California Physicians' Service with the recommendation of the Council that said by-laws be adopted.

18. **Farm Bureau Conference.**—Doctors Packard, Anderson, Rogers, and Mr. Hassard outlined the discussion and action taken at the Conference of the Special Committee of the Association and the Farm Bureau representatives held on January 13, 1939.

It was moved by Louis Packard, seconded by A. E. Anderson, that the County Hospital Bill, as outlined in the report of the committee, be recommended to the Legislative Committee and that they give it support, and it be allowed to follow the course as outlined. Carried.

19. **Exemption of Medical Books.**—On motion duly made, seconded and carried, the matter of exemption of medical books in libraries was ordered laid on the table.

20. **Nurses' Bill.**—The proposed California Nurses' Bill was discussed, and on motion of Charles Dukes, seconded by George Reinle, was referred to the Legislative Committee.

21. **Opticians' Legislation.** — Proposed legislation for the establishment of a licensing board for dispensing opticians was discussed. Doctor Kelly stated he felt that the most desirable method of procedure would be to amend the present law.

It was moved by T. Henshaw Kelly, seconded by Lowell Goin and Louis Packard, that the Council instruct the Legislative Committee to draft the necessary amendments for the Business and Professions Code to secure the right of dispensing opticians to dispense glasses under prescription by licensed doctors of medicine without acting under the jurisdiction of the Board of Optometry. Carried.

22. **Adjournment.**—There being no further business the meeting adjourned.

George H. Kress, *Secretary.*

Attest:

Karl L. Schaupp, *Chairman.*

CALIFORNIA PHYSICIANS' SERVICE: ARTICLES OF INCORPORATION*

Know All Men by These Presents That:

We, the undersigned, all of whom are residents of the State of California, and active members of the California Medical Association, a voluntary association originally formed March 12, 1856, now having its office and headquarters at Room 2004, Four Fifty Sutter Building, 450 Sutter Street, San Francisco, California, with the approval of said association heretofore duly given, and after more than ten years of continuous investigation and study by the said association, do hereby declare that the duties and obligations of the profession are not only leadership in the maintenance of high standards of medical service but also in the means of distribution of that service so that all who need it may receive it; that the very advances made by modern science have greatly increased the cost of good medical service and hospital care and will continue to increase that cost as new methods and equipment for diagnosis and treatment are discovered and perfected, and, therefore, the cost of always unpredictable injury or illness is a financial catastrophe too great to be borne by the few citizens of California thus always afflicted at any given time, although the total cost over any period is within the means of the total group; that a method which only the medical profession can most effectively provide is necessary properly to distribute this cost of medical service so as to relieve the intolerable financial burden heretofore falling on the unfortunate few in any given period of time; that the establishment by the profession of a voluntary medical service plan, participated in by all doctors of medicine desiring to do so, will enable the people of the State of California to obtain prompt and adequate medical attention and hospital care whenever needed on a periodic budgeting basis without injury to the standards of medical service, without disruption of the proper physician-patient relation and without profit to any agency, and will assure that all payments made by patients, except administrative costs, will be utilized for medical service and hospital care and not otherwise; that such a plan will create an efficient public and civic service without commercial exploitation of the patients or the profession or any restriction of an individual's fundamental right freely to select, when his need arises, the doctor of medicine and hospital desired by him; and finally, such a coördinated organized service can, upon the same fundamental basis, be the means which governmental agencies—federal, state, and local—may use to provide, at the lowest possible cost to the taxpayer, good medical service and hospital care for the indigent, needy or handicapped residents of California.

Wherefore, with the approval of the organized medical profession of the State of California, we, the undersigned, propose to form a nonprofit, social and civic corporation under the laws of the State of California and particularly as embodied in Article I, Title XII, Part Four, Division First, of the Civil Code of the State of California, and for the purpose of such incorporation we hereby unite in and adopt the following articles of incorporation, to wit:

---

* For the information of members of the California Medical Association, and for purposes of record, the Articles of Incorporation are printed in this issue. For other related items, see pages 81, 138, 153 and 164.

One: The name of this corporation is California Physicians' Service.

Two: This corporation does not contemplate and is not formed for the pecuniary gain or profit of the members thereof or the distribution of gains, profits or dividends to any of its members. The purposes for which this corporation is formed are:

1. The establishment and maintenance of a fund obtained by means of periodic payments by its beneficiary members and to be used to defray the cost to such beneficiary members of medical services, hospital care and other health services and facilities or medical services or hospital care alone or in conjunction with other health services and facilities.

2. To furnish and supply to those persons eligible for and admitted to beneficiary membership herein, hospital and nursing service at the lowest cost consistent with due and adequate care on a periodic payment plan in hospitals now or hereafter organized and established in the State of California, whose organization and management evidence that they are qualified to render and are actually rendering economic and efficient hospital care to the sick and injured.

3. To enter into, make, perform and carry out contracts with hospital service corporations now or hereafter operating hospital service plans on a nonprofit basis pursuant to Chapters 9 or 11A of Part Two, Division Two, of the California Insurance Code, under the terms of which contracts said nonprofit hospital service corporations may undertake to furnish maintenance and care in hospital, nursing care, drugs, medicines, physiotherapy, transportation, material appliances and their upkeep to beneficiary members of this corporation either directly or through hospitals with whom said nonprofit hospital service corporations may have contracted therefor.

4. To enter into, make, perform and carry out contracts for the performance of medical services by its professional members or for the furnishing of hospital care or both medical services and hospital care or for any other lawful object or purpose, with any public or municipal corporation, body politic, the State of California or any political subdivision of said State, any instrumentality, commission, board, bureau or other administrative agency of said State, the United States of America, or any department, bureau, commission or other administrative agency thereof, or any corporation incorporated under the laws of the United States or any foreign state.

5. To build, acquire, operate, equip, maintain, lease as lessee or lessor, mortgage, deed in trust, sell and otherwise dispose of hospitals, laboratories, drugs, medicines, medical and surgical apparatus, instruments and supplies and all other physical means and facilities for the relief, care and treatment of sick or injured persons.

6. And in aid and furtherance of the foregoing purposes:

(*a*) To act as trustee under any trust incidental to the principal objects and purposes of the corporation, and to receive, hold, administer and expend funds and property subject to such trust.

(*b*) To purchase, acquire, own, hold, lease either as lessor or lessee, sell, exchange, subdivide, mortgage, deed in trust, plant, improve, cultivate, develop, construct, maintain, equip, operate and generally deal in real and personal property of every kind or description.

(*c*) To enter into, make, perform and carry out contracts of any kind for any purpose without limit of any amount with any person, firm or corporation.

(*d*) To borrow money without limitation as to amount; to issue notes, bonds, debentures or other obligations of this corporation from time to time for any of the purposes of this corporation, and to secure the same by mortgage, pledge, deed of trust or other lien upon any or all of the property or assets of this corporation, or to issue the same unsecured.

(*e*) To lend money, purchase, acquire, hold on guaranty, sell, assign, transfer, mortgage, pledge or otherwise dispose of and deal in shares, bonds, debentures, notes or any other indebtedness of any person, firm or corporation and whether now or hereafter organized and existing; to exercise all the rights, powers and privileges of ownership thereof, including the right to vote thereon to the same extent as a natural person might, could or would do.

(*f*) To carry on any business whatsoever which this corporation might deem proper, or which might be calculated directly or indirectly to promote the objects and purposes of this corporation or to enhance the value of its service.

(*g*) To acquire all or any part of the good will, rights, assets and business of any person, partnership, firm, association or corporation heretofore or hereafter engaged in any enterprise, in whole or in part, similar to the objects and purposes of this corporation and to hold, utilize and in any manner dispose of the whole or any part of the rights and assets so acquired and to conduct in any lawful manner the whole or any part of the enterprise thus acquired.

7. To admit duly qualified persons to administrative, professional or beneficiary membership in the corporation and to suspend or expel any administrative, professional or beneficiary member for cause pursuant to the provisions of the by-laws.

8. To accept gifts, trusts and donations and receive property by devise or bequest, subject to the laws regulating the transfer of property by will, and to apply the principal or interest as may be directed by the donor or as the board of trustees of the corporation may determine in the absence of such directions, in aid and furtherance of the objects and purposes set forth in this paragraph Two.

9. To establish reserves and invest the funds thereof in bonds or in such other property as may be provided in the by-laws.

10. To levy assessments in such manner, upon such members and in such amount as may be provided in the by-laws.

11. To do all other acts necessary or expedient for the administration of the affairs and to attain the purposes of the corporation.

The foregoing statement of purposes shall be construed as a statement of both purposes and powers, and the purposes and powers stated in each clause shall be in nowise limited or restricted by reference to or inference from the terms of any other clause or paragraph of these articles. The objects, purposes and powers specified in each of the clauses or paragraphs in these articles shall be regarded as independent objects, purposes or powers. The enumeration of purposes and powers herein shall not be held to limit or restrict in any manner the general powers now or hereafter conferred on this corporation by the laws of the State of California or of the United States of America.

Three: The county in the State of California where the principal office for the transaction of the business of the corporation is to be located is the city and county of San Francisco.

Four: The names and addresses of the persons who are appointed to act in the capacity of directors until the selection of their successors and who shall bear the title and be known as trustees, are as follows:

Ray Lyman Wilbur, Stanford University.
C. Kelly Canelo, 241 East Santa Clara Street, San Jose.
W. Earl Mitchell, 2068 Allston Way, Berkeley.
Samuel Ayres, 2007 Wilshire Boulevard, Los Angeles.
Alson R. Kilgore, 490 Post Street, San Francisco.
Lowell S. Goin, 1930 Wilshire Boulevard, Los Angeles.
T. Henshaw Kelly, 490 Post Street, San Francisco.

Five: There shall be three classes of members, as follows: Administrative members, professional members, and beneficiary members.

1. Administrative members.

(*a*) The authorized number of administrative members of this corporation shall be seventy-five; the qualifications of the administrative members shall be as provided in the by-laws.

(*b*) The property, voting and other rights and privileges of administrative members are as follows: Every administrative member shall have the right to vote and hold office in the corporation, and all property, voting and other rights and privileges of each administrative member shall be equal to that of every other administrative member. Each administrative member shall be entitled to one vote on all matters and propositions submitted to such members and to one vote for each trustee to be elected by administrative members. Cumulative voting is expressly prohibited. The corporation shall have power by majority vote of the board of trustees to admit, and the board of trustees must admit, as provided in the by-laws, as administrative members, each person who is eligible for such membership, who shall be entitled to the same equal voting, property and other rights and privileges as then held and enjoyed by every other administrative member. All voting and property rights shall be vested in and held and enjoyed by the administrative members.

(*c*) Each of the incorporators hereof shall be qualified and eligible for administrative membership in this corporation and shall be an administrative member hereof.

2. Professional members.

(*a*) There shall be no limitation with respect to the authorized number of professional members; the qualifications of professional members shall be as provided in the by-laws.

(*b*) The property, voting and other rights and privileges of professional members are as follows: Professional members, as such, shall have no right to vote and no rights in the property of this corporation, except as provided in paragraph *Seven,* but every professional member shall have the right to hold office in the corporation and all rights and privileges of each professional member shall be equal to that of every other professional member. The corporation shall have power by majority vote of the board of trustees to admit, and the board of trustees must admit, as provided in the by-laws, as a professional member, any person who is eligible for such membership and who has, to the reasonable satisfaction of the board of trustees, agreed to abide by all rules and regulations with respect to the rendition of medical services or any of the activities of the corporation promulgated from time to time, as provided in the by-laws. Any person admitted as a professional member shall be entitled to the same equal rights and privileges as then held and enjoyed by every other professional member. Any professional member who is eligible to become an administrative member may be elected to administrative membership without loss of professional membership. Professional members shall have no right, title or interest in the property of the corporation.

(*c*) Professional members shall be liable equally to assessments or dues, or both, as may be provided in the by-laws.

3. Beneficiary members.

(*a*) There shall be no limitation with respect to the authorized number of beneficiary members; the qualifications of beneficiary members shall be as provided in the by-laws.

(*b*) The property, voting and other rights and privileges of beneficiary members shall be as follows: No beneficiary member shall have the right to vote or acquire or hold or possess any property right, or right, title or interest in or to any property or assets of the corporation, nor shall any beneficiary member have any rights or privileges other than as are provided herein and in the by-laws and in the certificate of beneficiary membership. The admission to beneficiary membership of duly qualified and eligible persons shall be effected as provided in the by-laws.

(*c*) Beneficiary members shall not be liable to assessments, but shall be liable to monthly, quarterly, semi-annual or annual dues, the prepayment of which shall be a condition to the privileges of beneficiary membership. The amount and method of collection thereof shall be as provided in the by-laws.

Six: (*a*) A roll of administrative members, a roll of professional members and a roll of beneficiary members shall be kept in a membership book and a certificate of administrative membership shall be issued to each administrative member admitted to such membership, a certificate of professional membership shall be issued to each professional member admitted to such membership, and a certificate of beneficiary membership shall be issued to each beneficiary member admitted to such membership. Issuance to and acceptance by a member of a certificate of membership in this corporation shall be conclusive evidence of the consent of such member to become a member of this corporation of the class to which admitted to membership and of his or her agreement to comply with and be governed by all of the provisions of these articles of incorporation, the by-laws of this corporation as then existing or thereafter amended, and all rules and regulations promulgated from time to time by the board of trustees pursuant to authority contained in the by-laws.

(*b*) Neither membership in this corporation, whether administrative, professional or beneficiary, nor any certificate evidencing the same, nor the interest of any administrative member in this corporation or any of the property or assets thereof shall:

1. Be subject to execution or become or be an asset of the estate of any deceased member or of any member who may become insolvent or bankrupt;

2. Descend to or vest in the heirs, legatees or devisees of any member; or

3. Be transferable or assignable in any form either by the voluntary or involuntary act of any member or by operation of law.

(*c*) In the event of the death, insolvency or bankruptcy of any administrative member or of any such attempted assignment or transfer of membership by any member, whether administrative, professional or beneficiary, or of any certificate evidencing the same, or of any interest of any administrative member in this corporation or in any of the property or assets thereof, whether by the voluntary act of the member or otherwise, such membership certificate, and, in the case of administrative membership, all interest of any such member in this corporation and in or to any of the property or assets thereof, shall be immediately canceled, revoked, and automatically terminated.

(*d*) Forfeiture or other termination of administrative, professional or beneficiary membership shall be governed by the by-laws and shall be as therein provided, except that the termination of membership for any reason shall forever and completely terminate any and all property and other interest of the member in this corporation or its assets and properties.

Seven: In the event of the dissolution of this corporation, all of its assets and property, after payment, satisfaction and discharge of all claims and demands against, and liabilities of the corporation, including claims of beneficiary members for the amount of dues then prepaid and unearned by the corporation, shall be distributed as follows: First, there shall be paid over and distributed to the professional members a sum equal to all assessments paid by them, and if the assets and property remaining are insufficient for a return in full to each professional member of all assessments, a pro rata distribution shall be made; second, any assets or property then remaining shall be paid over and distributed to the beneficiary members in proportion to the amount of dues contributed by each thereof.

Eight: Authority is hereby granted to the administrative members to change from time to time the authorized number of trustees of this corporation by duly adopted by-laws fixing or changing the number. By-laws may be adopted, amended or repealed by the trustees or by the vote or written assent of a majority of the administrative members.

Nine: These articles of incorporation may not be amended without the vote or written assent of two-thirds (2/3) of all of the administrative members.

In Witness Whereof, the undersigned, constituting the incorporators of the corporation, including the persons named hereinabove as the first trustees of the corporation, have executed these articles of incorporation this ——— day of January, 1939.

HOTEL RATES FOR DEL MONTE ANNUAL SESSION

The 1939 annual session of the California Medical Association will be held at Hotel Del Monte, commencing on Monday, May 1, and continuing through Thursday noon, May 4. In coöperation with the Hotel Del Monte, hotel rates have been secured as given in the list which follows. Requests for reservations may be sent to the Hotel Del Monte, or other hotels, direct.

(COPY)
Hotel Del Monte
Del Monte, California,
January 11, 1939.

Dr. George H. Kress
Secretary, California Medical Association
450 Sutter Street
San Francisco, California

Dear Doctor Kress:

As per your request with our Mr. Hubbard, we are enclosing herewith schedule of the various Peninsula hotel rates, compiled in connection with the annual session of the California Medical Association to be held at Del Monte, May 1–4, 1939.

You stated it was your wish to publish these rates in the next issue of the medical journal so that the doctors may refer to the same when making reservations for the period of the convention.

Thanking you for your coöperation in this matter, and with kindest regards, I am

Sincerely yours,
Natt Head,
Assistant Manager.

* * *

Hotel Del Monte, Del Monte

East Wing	*Per Day*
Single room without bath, one person	$7.50 each person
Double room without bath, two persons	7.00 each person
Single room with bath, one person	8.50 each person
Double room with bath, two persons	7.50 each person
Two single rooms, bath between, two persons	8.00 each person
Two double rooms, bath between, four persons	7.00 each person

Main Building, Cottages, and Remodeled West Wing

Single room with bath, one person	$9.50 each person
Double room with bath, two persons	8.50 each person
Sitting room	8.00

The above rates are based on the American Plan of service, which includes meals.

* * *

Del Monte Lodge, Pebble Beach

Located approximately five miles from the Hotel Del Monte, overlooking the ocean

Same management as Hotel Del Monte

Single room and bath	$9.50 per day per person
Double room and bath	8.50 per day per person
Sitting room	8.00 per day additional

American Plan, which includes meals.

Mission Inn, Monterey

Located in the heart of Monterey, one mile from Hotel Del Monte

10 rooms with double beds and bath	$3.00 single 4.00 double
5 rooms with twin beds and bath	5.00 double
6 rooms without bath	1.50 single 2.00 double
A few large suites accommodating from three to five persons	1.50 to 1.75 per person

* * *

Asilomar, Monterey Peninsula

Asilomar is located in Pacific Grove, about six miles from Hotel Del Monte

European Plan (without Meals)

	Persons	*Per Person*
16 double rooms, each with private bath and shower	32	$4.00
20 single rooms, each with connecting toilet and shower	20	3.00
10 double rooms, each with connecting toilet and shower	20	2.50
7 single rooms, each with connecting toilet	7	2.50
6 double rooms, each with connecting toilet	12	2.25
5 single rooms, running water—conveniences near by	5	2.25
30 double rooms, running water—conveniences near by	60	2.00
10 triple rooms, running water—conveniences near by	30	1.50

The above-mentioned accommodations are located in the Hill Top, Scripps, Lodge, and Guest Inn. These buildings are all heated, each has its own lounge and open fireplace, and all rooms, except four doubles in Scripps, have twin beds.

Meal Rates

Breakfast, 50 cents; lunch, 85 cents; dinner, $1.

* * *

Forest Hill Hotel, Pacific Grove

Located in Pacific Grove, approximately four miles from Del Monte—Situated in residential section of Pacific Grove

European Plan

Single room and bath	$2.50 per day
Double room and bath	4.00 per day
Double room and bath (twin beds)	5.00 per day

Dining Room

Breakfast, a la carte; luncheon, 65 cents; dinner, 85 cents and $1.

Garage, 35 cents per day.

* * *

Highland Inn, Carmel

Located four miles south of Carmel and seven miles from Del Monte

European Plan

Single room with bath	$4.00 and $4.50 per day
Double room with bath	5.00 and 6.00 per day

Meal Rates

Breakfast, 75 cents; luncheon, $1; dinner, $1.25

* * *

Hotel San Carlos, Monterey

Located in the heart of Monterey, one mile from Hotel Del Monte

European Plan

20 rooms with twin beds	$6.00 and $7.00 per day
45 rooms with double beds and tub bath	3.00 single 4.50 double
45 rooms with double beds and shower bath	2.50 single 3.50 double

* * *

La Playa Hotel, Carmel

Located in the heart of Carmel, and about five miles from Del Monte

European Plan

Single rooms—Lodging and breakfast, $4.00 to $6.00. Ocean view rooms starting at $5.00

Double rooms—Lodging and breakfast, $8.00 to $10.00. Ocean view rooms starting at $9.00

About forty of these rooms are equipped with twin beds, and ten with double beds.

Hotel La Ribera, Carmel

Located in Carmel, which is approximately five miles from Del Monte

7 twin-bedded rooms with bath	$5.00 per day
4 twin-bedded rooms without bath	3.50 and 4.00 per day
4 double rooms with bath (double beds)	3.00 single 4.00 double
4 double rooms without bath (double beds)	2.00 single 3.00 double
4 double rooms without bath (double beds)	2.00 single 3.00 double

* * *

Pine Inn, Carmel

Located in the heart of Carmel

	Per Day	
American Plan	*Single*	*Double*
Room with detached bath	$4.50	$7.00
Room with private bath	$5.00 to $6.00	$8.00, $9.00 $10.00, $12.00
European Plan		
Room with detached bath	$2.50	$3.00
Room with private bath	$3.00 to $5.00	$3.50 to $7.00

Cottages

American Plan, per person, per day	$4.00, $5.00, $6.00
European Plan per cottage, per day (depending on number of guests and choice of cottage)	$6,00 $8.00, $10.00, $12.50, $15.00

* * *

Hotel Monterey, Monterey

Small commercial hotel located in the heart of Monterey, one mile from Hotel Del Monte

European Plan

2 rooms with twin beds and bath	$4.00 double
4 suites (2 rooms, each with bath adjoining)—one double bed in each room	6.50—4 persons
1 suite (2 rooms, with one double bed in each, bath adjoining the two rooms)	6.50—4 persons
5 rooms with one double bed and bath at $2.50	3.00 double
7 rooms with one double bed and bath at $3.00	3.50 double
1 room with one double bed and shower at $2.50	3.00 double
20 rooms with one double bed, no bath, at $1.50	2.00 double

C. M. A. DEPARTMENT OF PUBLIC RELATIONS[†]

DOCTOR WILBUR HEAD OF NEW HEALTH PLAN

Dr. Morton R. Gibbons, Sr., San Francisco, Is Named Medical Director; Service Rates to Come Later

Seattle Study

Committee to Gather Data on Northern Organization; Speed to Be Sought in Operations

Dr. Ray Lyman Wilbur yesterday was elected president of the board of trustees which will regulate the new statewide health-insurance system.

In addition to being president of Stanford University, Doctor Wilbur is past president of the American Medical Association and former Secretary of the Interior.

The week-end meeting, officially designated as the first session of the board of trustees of the California Physicians' Service, appointed Dr. Morton R. Gibbons, Sr., of San Francisco as medical director for the system.

Aides Later

Doctor Gibbons' assistants will be named later by the Physicians' Service, through which the California Medical Association and its six thousand members will operate a system of medical and hospital insurance for persons of average means.

Also to be acted upon at further meetings of the trustees are the rates to be charged to subscribers, the maximum income groups to be eligible for membership, and the fees to be paid to doctors.

A committee was named to visit Seattle and study the "King County plan," which provides for medical care for approximately 35,000 workers in and around Seattle. The Seattle plan is similar to the California project.

With the report of this committee, plus other information now being gathered, the trustees will be enabled to decide on the type of service to be offered and its cost.

Facilities of the state's three nonprofit hospitalization insurance groups already in existence will be utilized to speed up operation of the medical association's system, the trustees said.

Groups Connected

These groups, which provide hospitalization only and not medical attention, are the Insurance Association of Approved Hospitals in the Bay Area, the Intercoast Service in Sacramento, and the Associated Hospital Service of Southern California.

Soon to be selected from a small group of candidates, according to the trustees, is a business manager for the service.

Present at yesterday's session, in addition to Doctor Wilbur and Doctor Gibbons were: Drs. C. Kelly Canelo of San Jose and Lowell S. Goin of Los Angeles, named vice-presidents; Dr. Alson R. Kilgore of San Francisco, elected secretary-treasurer; Dr. T. Henshaw Kelly of San Francisco, chosen assistant secretary-treasurer; Dr. W. E. Mitchell of Oakland, Dr. Samuel Ayres, Jr., of Los Angeles, and Hartley Peart and Howard Hassard, California Medical Association counsel.—*San Francisco Examiner*, January 30, 1939.

RECOMMENDATIONS OF THE AMERICAN PUBLIC HEALTH ASSOCIATION TO THE TECHNICAL COMMITTEE ON MEDICAL CARE[*]

1. It is certainly theoretically desirable that a single state agency should be made administratively responsible for carrying out all the provisions of the national health program which may be enacted into law.

In recommending that this single agency should be the state department of health, we recognize that the present patterns in most states do not conform to this proposal, yet we note evidence that organized medicine and many public welfare officials share our opinion that at least ultimately the state health department should be the responsible agency. We believe that there are many affirmative reasons why the state health department is the best agency at the state level for this purpose. No agency will be able so readily or effectively as the health department to provide professionally qualified personnel and be so readily or effectively able to maintain high professional standards of medical care.

In recommending that the state health department should be the primary integrating and coördinating unit, we recognize that the counsel of qualified advisers from the medical, dental, nursing, hospital and ancillary professions will be requisite, that adequate provisions for technical staffs and administrative expense will have to be made from the outset, and that increased funds for training purposes will be essential for successful performance. We have concluded further that, however reluctant medical health officers may be at present to take over these added responsibilities, a study of the alternative choices for such purposes will be determinative. This basic recommendation does not preclude a working arrangement in some states with existing machinery outside of the official health department which might function well through another channel, provided that the state health officer retains supervisory control over the broad plans and the general purposes of the funds which the state may receive. It is further recommended that in such plans due consideration will be given to the allocation of funds by a state department of health to the various substantial governmental jurisdictions within a state where population, extent of the special problems or financial need justify.

[†] The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. George G. Reinle of Oakland is the chairman and Dr. George H. Kress is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. George H. Kress, Room 2004, Four Fifty Sutter Street, San Francisco.

[*] The "Technical Committee on Medical Care" is a group consisting largely of lay members, who were appointed in 1935 by President Roosevelt's "Interdepartmental Committee" to bring in a report to the latter committee, subsequently submitted at the National Health Conference in July, 1938.

We note that this proposal is in accord with the recommendation of the Interdepartmental Committee that this program should be developed around and be based upon existing preventive health services.

2. The Committee reaffirms and reëmphasizes the official declaration of the American Public Health Association that, in the initiation and development of the program, wide latitude should be given to the states in the definition of the population to be served, in the selection of the method of providing medical service, and in other important phases of the proposed program. We believe that similar latitude should be provided with regard to the method of raising funds in the states to accomplish approved objectives.

3. The Committee finds itself in agreement with the recommendations in the national health program that the fundamental objectives involved here are, first, conservation of health and vitality and, second, reduction of the rôle of sickness as a cause of poverty and dependency. With this in mind, it supports the concept that Recommendations 1, 2, and 3 of the Interdepartmental Committee (the expansion of public health and maternal and child health services, the expansion of hospital, clinic and other institutional facilities, and the provision of medical care for the medically needy) should have priority in initiation.

4. We believe that recent experience demonstrates that the Social Security Act provisions for aid to the states for health work provide a suitable framework for the expansion of preventive health services.

5. We submit that it is essential that any state program to be approved for federal aid should contain adequate provisions for the maintenance of high personnel standards and that payment of such federal aid to state agencies should be withheld when it is found that substandard services are being furnished. Similar policy should obtain with respect to state aid to local areas within a state. The appropriate federal administrative authorities should have power to establish minimum standards through rule and regulation after consultation with competent advisory professional bodies.

6. Careful study will be necessary to perfect administrative regulations to cover the details concerned with the provision of medical services, so as to assure a high level of quality. We believe that standards of medical practice should not be written into basic law. Federal aid should be conditioned on inclusion within the state plans of adequate safeguards for maintaining appropriate standards.

7. We believe that the extension and improvement of public-health services in general throughout the country requires complete integration of health services of the Federal Government under one cabinet officer, preferably a Secretary of Health.

PRESIDENT ROOSEVELT MAY SUBMIT HEALTH PROGRAM TODAY

Message Expected Asking Congress for Huge Appropriation to Finance Plan

Washington, January 22 (AP).—President Roosevelt is expected to urge Congress, in a special message tomorrow, to enact legislation for a huge, long-range health-improvement program.

The health program, which would provide for expenditures of up to $850,000,000 annually from state and federal funds by 1949, has been a controversial issue since it was recommended to Mr. Roosevelt last July by his special Interdepartmental Committee of Health and Welfare.

It will go to a Congress already showing signs of economy-mindedness and embroiled at present in dispute over how much should be appropriated to run WPA for the next five months.

Meets New Setback

President Roosevelt suffered his second setback on the relief issues yesterday when the Senate Appropriations Committee aproved a $725,000,000 appropriation, the same amount voted by the House. The Chief Executive had asked $875,000,000.

Despite the committee's action, Administration leaders said they had hopes the Senate would vote the amount asked by the President. In that case the actual appropriation probably would be determined by a compromise committee of Senators and House members.

Recovery Peril Seen

Senator Wagner (Democrat), New York, asserted the bill as reported out "would do more than bring misery and privation to millions of American citizens—it would seriously threaten our entire recovery movement."

Abandonment of the relief and recovery program voted by the last Congress to stem the business recession which began in 1937, Wagner said in a statement, "would be a form of national economic suicide."

He said the relief sum asked by the President contemplated a net reduction of 400,000 in WPA employment by June and was "based on the most optimistic estimates of business revival."

Close Vote Expected

The estimate assumed, Wagner added, that private industry would absorb 1,500,000 of the present unemployed in the next five months.

Both Administration leaders and advocates of the lower figure conceded that the vote in the Senate would be close. One Administration supporter said there probably was a majority at present for the $725,000,000, but predicted several votes would shift to support of the President's recommendation.

Hopkins Vote Due

Mr. Roosevelt will have opportunity to discuss strategy in the floor fight for the higher figure when he has his regular weekly meeting tomorrow with his legislative lieutenants.

Senate debate on the relief appropriation may begin later in the day. Majority Leader Barkley (Democrat), Kentucky, said it would be taken up immediately after a vote on confirmation of Harry Hopkins' nomination to be Secretary of Commerce. An affirmative vote is expected tomorrow; even those who said they would vote against confirmation conceded there was no chance that the nomination would be rejected.

Senate and House committees will hear war and navy officials this week on President Roosevelt's defense recommendations. Hearings will start on railroad legislation.

Wagner Drafts Bill

Senator Wagner has prepared a bill calling for a $50,000,000 appropriation to begin the proposed health program.

While the proposal stirred up some opposition in medical circles, the American Medical Association agreed last September with the Interdepartmental Committee that there was a vital need for an extension of existing medical facilities.

Money appropriated for the health program would, according to recommendations of the committee, be used to:

1. Pay physicians to care for those too poor to afford medical care.
2. Assist existing hospitals and build new ones where needed, particularly in rural areas.
3. Establish clinics for quick diagnosis and treatment of disease.
4. Encourage vaccination against preventable diseases.
5. Develop maternal and child welfare facilities, including baby clinics, schools for expectant mothers, visiting nurses, and obstetrical care if needed.
6. Stimulate public health service to control disease through such activities as controlling stream pollution, establishing more efficient quarantines, health instruction for both children and adults and closer inspection of milk and water supplies.

Funds would be allotted to states and communities under restrictions requiring that they do their part in health promotion.—Los Angeles *Times*.

TEXT OF ROOSEVELT MESSAGE URGING UNITED STATES HEALTH PROGRAM

Washington, January 23 (AP).—The text of President Roosevelt's message to Congress today proposing a national health program follows:

In my annual message to the Congress I referred to problems of health security. I take occasion now to bring this subject specifically to your attention in transmitting the report and recommendations on national health prepared by the Interdepartmental Committee to coördinate health and welfare activities.

The health of the people is a public concern; ill health is a major cause of suffering, economic loss, and dependency; good health is essential to the security and progress of the nation.

Health needs were studied by the Committee on Economic Security, which I appointed in 1934, and certain basic steps were taken by the Congress in the Social Security Act. It was recognized at that time that a comprehensive health program was required as an essential link in our national defenses against individual and social insecurity. Further study, however, seemed necessary at that time to determine ways and means of providing this protection most effectively.

Tells Finding of Nation-Wide Group

In August, 1935, after the passage of the Social Security Act, I appointed the Interdepartmental Committee to coordinate health and welfare activities. Early in 1938 this committee forwarded to me reports prepared by their technical experts. They had reviewed unmet health needs, pointing to the desirability of a national health program, and they submitted the outlines of such a program. These reports were impressive. I, therefore, suggested that a conference be held to bring the findings before representatives of the general public and of the medical, public health, and allied professions.

More than two hundred men and women, representing many walks of life and many parts of our country, came together in Washington last July to consider the technical committee's findings and recommendations and to offer further proposals. There was agreement on two basic points: the existence of serious unmet needs for medical service, and our failure to make full application of the growing powers of medical science to prevent or control disease and disability.

Declares Some Parts of Country Handicapped

I have been concerned by the evidence of inequalities that exist among the states as to personnel and facilities for health services. There are equally serious inequalities of resources, medical facilities and services in different sections and among different economic groups. These inequalities create handicaps for the parts of our country and the groups of our people which most sorely need the benefits of modern medical science.

The objective of a national health program is to make available in all parts of our country and for all groups of our people the scientific knowledge and skill at our command to prevent and care for sickness and disability; to safeguard mothers, infants, and children; and to offset, through social insurance, the loss of earnings among workers who are temporarily or permanently disabled.

The committee does not propose a great expansion of federal health services. It recommends that plans be worked out and administered by states and localities with the assistance of federal grants-in-aid. The aim is a flexible program. The committee points out that, while the eventual costs of the proposed program would be considerable, they represent a sound investment which can be expected to wipe out, in the long run, certain costs now borne in the form of relief.

Recommends Careful Study by Congress

We have reason to derive great satisfaction from the increase in the average length of life in our country and from the improvement in the average levels of health and well-being. Yet these improvements in the averages are cold comfort to the millions of our people whose security in health and survival is still as limited as was that of the nation as a whole fifty years ago.

The average level of health or the average cost of sickness has little meaning for those who now must meet personal catastrophes. To know that a stream is four feet deep on the average is of little help to those who drown in the places where it is ten feet deep. The recommendations of the committee offer a program to bridge that stream by reducing the risks of needless suffering and death, and of costs and dependency, that now overwhelm millions of individual families and sap the resources of the nation.

I recommend the report of the Interdepartmental Committee for careful study by the Congress. The essence of the program recommended by the committee is federal-state coöperation. Federal legislation necessarily precedes, for it indicates the assistance which may be made available to the states in a coöperative program for the nation's health.—Los Angeles *Herald-Express*.

CANCER COMMISSION OF THE CALIFORNIA MEDICAL ASSOCIATION

I. X-Ray Conference

The annual Radiological Conference, sponsored by the Cancer Commission, will take place at Del Monte, Sunday, April 30, 1939, in connection with the State meeting. The morning program will consist of diagnostic problems beginning at 10 o'clock, and the afternoon, of therapeutic problems, beginning at 1:30 o'clock. The chairman of the committee arranging this meeting, who will have charge, is Dr. L. H. Garland. If you have a problem for discussion, bring it along with films and slides. It would be advisable to have extra films, so that they could be viewed on extra boxes at close range.

Kindly inform if you have a problem, and make reservations with Chairman L. H. Garland at 450 Sutter Street, San Francisco, or with the Secretary of the Cancer Commission, Dr. Otto H. Pflueger, 384 Post Street, San Francisco.

II. Cancer Commission General Meeting

The first meeting for general surgeons and general practitioners, sponsored by the Cancer Commission of the California Medical Association, will take place in Del Monte, Sunday, April 30, 1939, in connection with the State meeting. The program, which is to begin at 10 a. m., will consist of malignant tumors of the skin, being presented in the morning, and tumors of the breast comprising the afternoon program. Clinical material will be presented together with microscopic slides of cases under discussion. It will be necessary, therefore, that you bring a microscope if you plan to attend.

In the past many non-specialists have attended the other meetings sponsored by the Cancer Commission, and it is for these persons that this meeting is being arranged. We are sure that it will be an interesting meeting and very worth while.

Accommodations must be limited for the greatest benefit to those attending, and it will be necessary, therefore, that reservations be made with the secretary of the Cancer Commission, Dr. Otto H. Pflueger, 384 Post Street, San Francisco.

Please let us stress the need for making early reservations and the necessity of each attendant bringing a microscope.

* * *

III. Cancer Commission Pathological Conference

The next Microscopic Conference, sponsored by the Cancer Commission of the California Medical Association, will be held in connection with the State meeting on Sunday, April 30, 1939, at 9:30 a. m. The committee in charge of this conference consists of Drs. Paul Michael (chairman), Jesse Carr, and Alvin Cox. If you have a case which you would like to present, send in two or three sample slides and a case history for the committee's approval. If a case is accepted, the committee will notify you and ask that you make up a set of sixty slides for distribution. The committee is particularly anxious to obtain slides which are made of properly fixed material, so that the slides will be satisfactory for diagnosis.

We are particularly interested in getting the cases ready several weeks before the meeting, and would appreciate receiving sample slides and histories as early as possible. We feel that if slides can be sent to the pathologists throughout the state at least two weeks before the meeting, the cases can be diagnosed more satisfactorily and the discussion will be much more interesting.

Will you kindly give this matter your prompt attention, in order that we may make the program as interesting as possible. Kindly send your preliminary histories and slides to the chairman of the committee, Dr. Paul Michael, 434 Thirtieth Avenue, Oakland. He will get in touch with you concerning the cutting of sixty sections if your cases are accepted.

Bring your own microscope and make reservations with the chairman of the committee, or with the secretary of the Cancer Commission, Dr. Otto H. Pflueger, 384 Post Street, San Francisco.

PROPOSED MEDICAL LEGISLATION

Submitted to 1939 California Legislature

Bills Introduced Prior to January 27, 1939:

S. (Senate) 130 and A. (Assembly) 493 propose to require a physician or other person attending a pregnant woman to obtain or cause to be obtained a blood specimen at or within ten days after his first professional visit. The blood specimen thus obtained must be submitted to an approved laboratory for a standard laboratory test for syphilis.

S. 144, A. 490 and A. 492, to amend the laws relating to vital statistics, propose that a certificate of birth include, in addition to the information now required by law, the following item: "Prenatal examination for syphilis, including period of gestation in months or weeks at which examination was made, and if examination was not made, including reason for not making such examination."

S. 173 and A. 106 propose as a condition precedent to the issuance of licenses to marry that each party to a prospective marriage present a physician's certificate that he or she "has been given such examination, including a standard serological test, as may be necessary for the discovery of syphilis, made not more than thirty days prior to the" application, "and that in the opinion of the physician the person either is not infected with syphilis, or if so infected, is not in a stage of that disease which is or may become communicable to the marital partner."

A. 235 proposes to exempt from the Use Tax Act of 1935 "The storage, use or other consumption in this state of orthopedic supplies."

A. 236 proposes to exempt from the Retail Sales Tax Act of 1933 "the gross receipts from sales of orthopedic supplies."

A. 342 proposes to prohibit the issuance of a license to marry unless both parties to the prospective marriage file a certificate made by a physician within ten days of the application showing that both parties are free from any contagious, infectious or communicable disease.

A. 437, to supplement the Business and Professions Code, proposes to make it a misdemeanor for any person who does not possess a physicians and surgeons' certificate or a drugless practitioner's certificate to use in any sign or advertisement the term "drugless physician, drugless methods, naturopath, naturopathic physician, sanipractor, masseur, physiotherapist, physical-therapist, diet specialist or health adviser or who uses any degree or the abbreviation relating to or standing for all or any of the foregoing terms."

A. 438, to supplement provisions of the Business and Professions Code relating to the practice of medicine, proposes that "The fraudulent representation by advertisement or otherwise that a manifestly incurable condition or sickness, disease, deformity, ailment, or injury of any person can be cured constitutes unprofessional conduct within the meaning of this chapter."

A. 449 proposes that on and after July 1, 1940, every applicant for a physicians and surgeons' or drugless practitioner's certificate, or for a certificate to practice chiropody or midwifery must be a citizen of the United States.

A. 450 proposes to make the sale, dispensing, or prescribing of dinitrophenol for therapeutic purposes a misdemeanor.

A. 477, to supplement the Business and Professions Code, proposes that unless a person holds a physicians and surgeons' certificate, or is licensed or authorized to use the title "doctor" or the letters or prefix "Dr.," the use of the title or letters or prefix without further indicating the type of certificate held, constitutes unprofessional conduct.

A. 469, to supplement the Business and Professions Code, proposes to make it unprofessional conduct, within the meaning of the chapter relating to medicine, for a licentiate knowingly to make or sign any certificate or other document required by law which falsely represents the existence or nonexistence of a state of facts.

A. 478, to amend the Business and Professions Code, proposes that the drugless practitioner's certificate provided for by the code, in addition to the authority it now confers, shall also authorize "the general and local application or use of any and all mechanical, manipulative, electrotherapeutical, hydrotherapeutical, dietary and psychological methods of treating the sick or afflicted for any purpose, including physiotherapy, physical therapy, colonic therapy, all methods of massage, baths, and any and all other types of drugless methods of treatment for the sick and afflicted."

A. 484 proposes to authorize courts, on the application of the people, the Board of Medical Examiners or the Board of Osteopathic Examiners, to restrain the unlicensed practice of medicine or osteopathy.

COMPONENT COUNTY MEDICAL SOCIETIES

KERN COUNTY

The Kern County Medical Society met at the Mercy Hospital in Bakersfield on Thursday evening, January 19. Dr. Chester Mead presided.

The new officers for 1939 are: Chester Mead, president; A. R. Moodie, vice-president; C. S. Compton, secretary. Harry Lange was elected to the Board of Directors. New delegates are: F. T. Gundry and C. S. Compton, with H. W. Jones and John McCarthy as alternates.

Two new members were welcomed into the Society: Dr. J. E. Vaughan and Dr. C. B. Stockton, both of Bakersfield.

Dr. L. A. Packard reported on the latest developments concerning the California Physicians' Service. The report was received with great interest by the members, who have pledged support of the proposed program.

Members were requested to submit topics for discussion at the postgraduate study course to be given this year.

Dr. Roderick A. Ogden introduced the speaker of the evening, Dr. James C. Negley of Glendale. Doctor Negley presented a statistical study on the *Modern Treatment of Bladder-Neck Obstructions,* based on observations in five private and charity hospitals in Los Angeles up to 1935. He reviewed instruments designed to relieve obstructions. His conclusions were that the operation of resection is now being used mainly by well-trained physicians and that the belief that resection is a minor procedure is waning. Also that prostatectomy is much the safer procedure for the majority of surgeons and that patients for resection need the same careful preoperative preparation as patients for prostatectomy. He also pointed out that many patients who have had resections continue to have symptoms following operation.

The meeting was then adjourned, following which light refreshments were served.

C. S. Compton, *Secretary.*

*

MENDOCINO-LAKE COUNTY

The meeting of the Mendocino-Lake County Medical Society was held in the auditorium of the State Hospital at Talmage on December 10, 1938. In the absence of the president, Doctor Craig, the meeting was called to order by the secretary, Doctor Smalley. Doctor Cushman was asked to preside.

In addition to the members present, the Society had as guest speakers, Dr. George H. Kress, Secretary of the California Medical Association, and Dr. William Shepard. Secretary of the California Medical Association Pneumonic Control Committee.

The scientific aspect of pneumonia control with specific serum was discussed by Doctor Shepard, followed by a sound film on the same subject. Doctor Kress discussed the California Medical Association's plans for a state-wide medical service.

The following officers were nominated for the coming year: R. B. Smalley, president; Royal Scudder, vice-president; and Dallas Wagner, secretary-treasurer.

No other nominations being made, these candidates were unanimously elected.

For the office of delegate, Dr. Ruggles Cushman was unanimously elected; and for alternate, Dr. G. I. Barcklow.

A resolution of thanks to Doctors Kress and Shepard was unanimously adopted.

Likewise a resolution thanking Doctor Cushman for his cordial hospitality.

Robert B. Smalley, *Secretary.*

*

PLACER COUNTY

The Placer County Medical Society held its meeting on January 21 at the Freeman Hotel, Auburn, with the president, William M. Miller, presiding. In addition to President Miller, there were present the following members and visitors:

Members—Doctors P. D. Barnes, Casey, Dubin, Dunievitz, Empey, Eveleth, Hummelt, Kindopp, Lewis, Lundegaard, Padgett, Peers, Rood, and Weddle.

Visitors—Dr. George M. Uhl, Chief of the Bureau of County Health Work of the State Department of Public Health, and Miss Lu Crandall, school nurse.

Following the reading of the minutes, President Miller stated that the order of business would be suspended so that Doctor Uhl and Miss Crandall might address the Society.

Doctor Uhl presented to the Society *a proposed plan for a full-time public health unit for a district,* comprising Placer, Nevada, and El Dorado counties, and asked the endorsement of this project. After full discussion of the matter, the county society endorsed the project.

The county society also endorsed a project presented by Miss Crandall for a *county-wide immunization against smallpox.*

The application of Dr. George A. Foster of Grass Valley for transfer from the Sacramento Society for Medical Improvement to the Placer County Medical Society, was read and, on motion of Doctor Peers, seconded by Doctor Empey, Doctor Foster was unanimously elected to membership.

The Secretary-Treasurer read a supplemental treasurer's report, showing that the cost of the advertising campaign against Proposition No. 2 on the November ballot was $149.30, and giving a statement of the present funds on hand.

Following the reading of correspondence and other routine business, Doctor Empey reported on the recent meeting of the special session of the House of Delegates held in Los Angeles in December. Doctor Empey's report brought out considerable discussion.

Robert A. Peers, *Secretary.*

*

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society was held on January 5 on the roof garden of the Hotel Wolf. The meeting was called to order at 7:30 p. m. In the absence of the president, A. C. Boehmer, the meeting was called to order by the secretary, G. H. Rohrbacher, who introduced and turned the meeting over to President-elect Neill P. Johnson. Doctor Johnson told the Society his aim for the year, and named his committees for the year 1939.

Applications of Louis B. Saslaw and E. L. Blackmun, Jr., were presented and referred to the Admissions Committee. A communication from the Woman's Auxiliary to the San Joaquin County Medical Society was read, in which was enclosed a check for $1.46, being the amount returned to us after deduction from the $25 advanced to them. In their letter the Woman's Auxiliary stated that they had spent $23.54 in helping to defeat Proposition No. 2. Dr. Dewey Powell made a motion, seconded from the floor, that the check be returned to the Woman's Auxiliary for inclusion in their treasury. Doctor Powell read a eulogy on the passing of our late member, Dr. S. W. R. Langdon.

Doctor Broaddus spoke on the Postgraduate Committee, and presented certificates to several elected members of the Medical Academy of Graduate Study.

Dr. A. E. Anderson of Fresno, Councilor for the Fourth District, was introduced by President Neill P. Johnson. Doctor Anderson talked on the recent Del Monte meeting, at which time the prepayment of medical services was discussed. Doctor Anderson introduced President W. W. Roblee of the California Medical Association, who gave a very interesting talk on *the effort that had been made over a period of years by the California Medical Association to get the medical payment plan in that large group in the frankly indigent and the well-to-do classes.* He also touched on the aspect of socialized medicine from the federal viewpoint. Doctor Roblee then introduced Doctor George H. Kress, Secretary of the California Medical Association, who elaborated on the remarks of the two previous speakers.

Dr. Charles Sears, President of the Northwestern Medical Association and of the Oregon Medical Society, was present as a guest and was called upon by the Chair for any remarks that he might like to make. Doctor Sears stated that he was there to hear rather than to talk, but told briefly of plans in Oregon for handling a similar situation.

Mr. Harvey Van Vlear, Secretary of the San Joaquin County Farm Bureau, was present as a guest of the Medical Society and was called upon by the Chair for any remarks that he would like to make. Mr. Van Vlear spoke on the desire for coöperation between the Farm Bureau group and the Medical Society group, and stated that they were unalterably opposed to any compulsory medical service controlled by the state.

Dr. Dewey Powell, Frank Doughty, and C. A. Broaddus, delegates to the recent meeting at Los Angeles, told their reactions to this meeting and elaborated on the remarks of the other speakers.

There being no further business to come before the Society the meeting was declared adjourned at 11:15 p. m.

G. H. Rohrbacher, *Secretary.*

⁂

SAN MATEO COUNTY

The meeting of the San Mateo County Medical Society was held on Wednesday evening, December 28, 1938, in the main dining room of the Benjamin Franklin Hotel. Doctor Hartzell Ray presided.

The meeting was well attended by members of the Society and their wives.

Doctor Ray announced that officers had been nominated at the previous meeting and that there had been no further nominations, and upon motion duly made, seconded and unanimously carried, the officers previously nominated were declared elected. The new officers are as follows: N. D. Morrison, president; Carl Benninghoven, vice-president; J. Garwood Bridgman, secretary; and Harper Peddicord, member of the board of directors.

Doctor Ray gave a report on the special meeting of the House of Delegates at Los Angeles, in which report he included the report of the Council to the House and the tentative draft concerning rules and regulations concerning hospitalization and medical care to be provided by the newly formed California Physicians' Service. The Secretary discussed the proposed plan and reported on the fourteen resolutions which were acted upon by the House of Delegates at the special meeting. The Secretary then introduced Dr. Alson A. Kilgore of San Francisco, who gave a very enlightening résumé of the situation and discussed the plan at some length, giving special attention to the factors underlying the decision of the Council to submit the proposed plan to a special session of the House of Delegates. Following Doctor Kilgore's discussion, he generously answered questions raised from the floor.

J. Garwood Bridgman, *Secretary.*

TULARE COUNTY

The Tulare County Medical Society held its regular meeting at the Hotel Johnson in Visalia on January 9 at 7 p. m. Dinner preceded the business meeting.

Dr. Elmo Zumwalt called the meeting to order at 8:20 o'clock.

A series of applications for membership to the Tulare County Medical Society was heard from Robert S. Hardin, Ellis Z. Sox, Fred Glenn De Busk, all of Visalia; Wiley Carl Zink and William Stanliey Ireton of Tulare. A short biography of each was read and, their applications having been passed on by the Board of Censors, they were unanimously elected to membership.

The new forms for the Emergency Relief Administration of the State of California for medical relief were shown to the members and a general discussion of matters pertaining to state relief administration medical attention followed. At the conclusion of the discussion, Doctor Zumwalt appointed Doctors Guido (chairman), Betts, and Ambrose to prepare recommendations from the Tulare County Medical Society regarding the schedule and other important state relief administration matters. A copy of their report is to be transmitted to the secretary before transmittal to the state relief administration officers.

A brief review of the voluntary staffing of the Tulare County Hospital agreement with the Board of Supervisors was next presented to the members for a decision at this time as to the future continuance of this service. There was a general discussion from the floor with various suggestions and a final motion by Dr. J. C. McClure, seconded by Dr. W. Zink, as follows:

It is moved and seconded that the Tulare County Medical Society appoint those men at present acting on the voluntary staff at the Tulare County Hospital and those wishing to act in the future, as a committee to organize and operate the Tulare County Hospital as they see fit. This group is then to report to the Tulare County Medical Society, who will subsequently communicate the plans to the Tulare County Board of Supervisors for their approval.

Dr. Ellis Scott, Tulare County Health Officer, presented a communicable disease chart and reported on the conditions of the county, generally, since his administration took over.

Election of officers for the year 1939 resulted in a unanimous ballot being cast for the following: Newton Miller of Porterville, president; Palmer D. Miller of Dinuba, vice-president; Ray E. Cronemiller, secretary-treasurer; S. S. Ginsburg (1942), Ray Rosson (1940), and A. W. Preston (1939), censors.

Delegates to the State convention: Elmo R. Zumwalt of Tulare; alternate, Newton Miller of Porterville.

Doctor Zumwalt concluded the meeting with a word of appreciation for the coöperation extended him during the past year.

Karl F. Weiss, *Secretary.*

⁂

VENTURA COUNTY

The regular monthly meeting of the Ventura County Medical Society was held at the Saticoy Country Club on Tuesday, January 10.

Doctor Mosher introduced Dr. Elmer Belt of Los Angeles, who gave a very interesting and instructive talk on *Gonorrhea and Its Complications.* Doctor Belt introduced Doctor Folkenberg of Los Angeles, who discussed the *Treatment of Gonorrhea by Sulfanilamid and Heat;* he also presented the latest methods for culturing the organisms.

The following communications were read: (1) From the Committee on Scientific Work regarding a booth devoted to plans and photographs of modern offices of physicians. (2) From the State Medical Library, Los Angeles Division, in regard to journals available. (3) From the Los

Angeles Society of Ophthalmology and Otolaryngology regarding a proposed legislative bill to license and regulate dispensing opticians.

Doctor Smolt moved that the Society endorse a bill to license and regulate dispensing opticians in the State of California, and that the secretary of the California Medical Association be informed by letter. The motion was seconded by Doctor Coffey and was unanimously carried.

Doctor Shore moved that the Society request the Council of the California Medical Association to set up a unit of the California Physicians' Service in this district as soon as expedient. Seconded by Doctor Strong. Carried.

Doctor Shore moved that Doctor Packard of Bakersfield be named to the Board of Directors of the California Physicians' Service. Seconded by Doctor Smolt. Unanimously carried.

A. A. Morrison, *Secretary.*

In Memoriam

Bishop, Thomas W. Died at South Pasadena, December 28, 1938, age 68. Graduate of Bellevue Hospital Medical College, New York, 1895, and licensed in California the same year. Doctor Bishop was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

✣

Hobdy, William Cott. Died at San Francisco, December 26, 1938, age 68. Graduate of Columbia University College of Physicians and Surgeons, New York, 1896. Licensed in California in 1920. Doctor Hobdy was a member of the San Francisco County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✣

Langdon, Samuel Walter Ross. Died at Stockton, December 29, 1938, age 65. Graduate of the University of California Medical School, San Francisco, 1900, and licensed in Californa the same year. Doctor Langdon was a member of the San Joaquin County Medical Society, the California Medical Association, and the American Medical Association.

✣

Taltavall, William Allan. Died at Redlands, December 22, 1938, age 79. Graduate of Columbia University College of Physicians and Surgeons, New York, 1885. Licensed in California in 1903. Doctor Taltavall was a member of the San Bernardino County Medical Society, the California Medical Association, and the American Association.

OBITUARIES

William C. Hobdy

1870–1938

At the age of sixty-eight years, with a most commendable medical record behind him, Dr. William C. Hobdy recently passed away. He was a member of the San Francisco County Medical Society since 1921, having come here the year previously from Hawaii. Doctor Hobdy was a Kentuckian by birth and education, graduating from the University of Kentucky, where he was the outstanding athlete and honor man. Later, at the Columbia University Medical School he found time to be a member of the Columbia crew. After two years as house officer there, he joined the United States Public Health Service and was sent to the Hawaiian Islands. The character of his work there resulted in his being ordered to San Francisco at the time of our serious plague in 1906. With his family, he arrived here six weeks before our earthquake, safe in his residence at Angel Island. He was Port quarantine officer during the plague, while Dr. Rupert Blue was in charge of the city. Among his many responsibilities was the difficult feat of completely disinfecting twelve large ships a day average for a year.

He then returned to the Hawaiian Islands and continued only briefly his public health work, returning from that into extensive general surgery. He was on the teaching staff of Stanford University and Franklin Hospital. He reached the heights of the Masonic order, and for some years was noted for his interest in big game hunting.

His widow and daughter and son have been extended our sympathy in the loss of a valued member with a brilliant career behind him.

H. M. F. Behneman, M. D.

✣

Samuel Walter Ross Langdon

1873–1938

The members of the San Joaquin County Medical Society were shocked and grieved to learn of the sudden passing on December 30, 1938, of their esteemed and respected fellow member, Dr. Samuel Walter Ross Langdon.

Doctor Langdon was born in the city of Stockton on September 12, 1873. His family was prominently identified with the pioneer days of California, and he was a direct descendant of Reverend Samuel Langdon, president of Harvard during the Revolutionary War. His two uncles, Dr. Samuel Langdon and Paul Langdon, came to California in 1847. Paul was one of the first commandants of Mare Island Navy Yard, and Doctor Samuel, after serving there for a period in a professional capacity, came to Stockton and was on the State Hospital staff from 1856 to 1857.

Samuel W. R. Langdon, Jr., entered Harvard in 1893 and received an A. B. degree in 1897. He entered the University of California Medical School in 1897 and received an M. D. degree from that institution in 1900. He interned a year at the French Hospital in San Francisco, and then served a year on the Emergency Hospital staff in that city. He began the practice of medicine in the city of Stockton in 1902, and for eight years he was health officer of the city of Stockton. He served for six years as superintendent of Clark's Sanitarium, a private sanitarium for nervous and mental diseases. In 1908, during the bubonic plague in California, he was one of the committee of five appointed in the eradication of plague in the state. In 1909 he was president of the Central California Health Association, and in 1910 president of the San Joaquin Valley Medical Society.

During 1902 and 1912, Doctor Langdon was also active in the civic, political, and church life of the community. In 1920 he disposed of his interests, in which he had been quite successful, and, freed from business responsibilities, he spent the next several years, 1922 to 1925, in traveling with his family about the world. From 1925 to 1930, inclusive, he lived in Oakland, retired, merely supervising his various interests. In 1931 he joined the staff of the Stockton State Hospital, in which capacity he was still active up to the time of his death.

To those of us who had the privilege of knowing Doctor Langdon through the years there will always remain the vivid impression of the kindly gentleman. He manifested those many qualities of courtesy and consideration so characteristic of the Old South, whence his ancestors came to this far western country, and his greatest delight was in sharing with his friends the hospitality of his home.

The members of this society extend to his widow, son and daughter, their most sincere sympathy in their great loss.

Dewey R. Powell, M. D.

Donald Maclean
1872–1939

The people of the State of Nevada came to mourn the loss of one of their most beloved citizens, and the medical profession of the state one of its most prominent surgeons, in the passing on the fourth day of January of Dr. Donald Maclean.

Doctor Maclean was the only son of the late Dr. Donald Maclean, former professor of surgery at the Ann Arbor Medical School. After attending the schools in Detroit, Michigan, he was sent by his father to the University of Edinburgh, where he received the degree of M. D. in 1898. Upon his return to this country he enlisted in the army during the Spanish-American War and was sent to the Hawaiian Islands, where he served until the end of the war. In 1903 he was associated with Dr. Maurice Kahn at the Leadville, Colorado, mines, later to be relieved by Doctor Connell. He came to the State of Nevada in 1905 and has been a resident of this state ever since, having attained through his genial disposition, his incomparable frankness, thorough understanding, keen surgical judgment, and ability, a host of friends over the entire state. Doctor Maclean was always very active in the political life of the state, and served as chief medical adviser to the Nevada Industrial Commission in the years 1913 to 1927. He held many other appointments during his life, such as surgeon to the Orphans' Home; surgeon to the Nevada State Penitentiary in the years 1910 to 1923; chief of staff at Saint Mary's Hospital for two consecutive terms; past president of the Washoe County Medical Society; and up until the time of his death, a member of the Board of Hospital Trustees of the Washoe General Hospital. He was a member of the Nevada State Medical Association, the American Medical Association, and a Fellow of the American College of Surgeons.

Doctor Maclean had been in failing health for the past four months, and was stricken with coronary thrombosis at his desk in the sixty-sixth year of his life. In his passing we have lost one of our most beloved surgeons. For a long time to come his kindly personality will be missed by the scores of friends and patients to whom he has always been a guiding spirit.

Vinton A. Muller.

Henry Corbin McClenahan
1871–1939

At the age of sixty-eight years, the San Francisco County Medical Society lost one of its oldest members in the death of Doctor McClenahan. He was born in Georgia, and received his medical education at Tulane University. Coming to California in 1903, he was intimately connected with Belmont Sanitarium for some years. He then went abroad to study, later returning to San Francisco. Doctor McClenahan led a very active life, practicing before coming here, first in Texas, and then as the surgeon in charge of Roosevelt's famous "Rough Riders" in Cuba. He obtained the rank of captain in the Spanish-American War. He was an avid hunter, being at one time champion of the southern United States in pigeon shooting.

He published quite a bit in his specialty of psychiatry and neurology, and was on the staff of Cooper, later Stanford Medical School. Doctor McClenahan never was in general practice, but confined his work to the field of neurology, in which he was for some years an outstanding clinician.

H. M. F. Behneman, M. D.

Peter Arthur Tobin
1887–1938

The San Francisco County Medical Society lost one of its more recent, but highly valued members, in the death of Peter Arthur Tobin on November 20 last. Doctor Tobin was educated in the public schools of Denver, and received the first part of his medical education at the University of Colorado. He received his medical degree at the University of Cincinnati in 1912, and interned at Christ's Hospital. Doctor Tobin had a very extensive general practice in Fresno, California, from 1914 to 1927, leaving there a host of friends. He moved to San Francisco in that year and had been on the visiting staff of Mary's Help and St. Mary's hospitals, as well as in general practice in this city.

Doctor Tobin was an officer in the 143rd Field Artillery, and was overseas for two years during the World War. He was prominent in service clubs, and besides his general practice he carried on a good deal of industrial work. He leaves a widow and several sons to whom the Society has expressed their sincere sympathy.

H. M. F. Behneman, M. D.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION[†]

MRS. CLIFFORD A. WRIGHT	President
MRS. FRED H. ZUMWALT	Chairman on Publicity
MRS. FRANK H. RODIN	Assistant Chairman on Publicity

Official Notice

State Board Meeting.—Mrs. Clifford Andrews Wright announces that the next meeting of the officers and board of directors will be held in San Francisco on Friday, February 17 at the Fairmont Hotel.

Component County Auxiliaries

Alameda County

Health Service in Scandinavia was the interesting and timely topic presented by Dr. Walter H. Brown of the department of hygiene and physical education of Stanford University at the meeting of the Woman's Auxiliary to the Alameda County Medical Association held on January 20.

The president, Mrs. Frank Baxter, presided and Mrs. Harry Akesson, Chairman of Public Health, presented the speaker.

About one hundred members and guests were graciously received by the hostesses, Mesdames William H. Sargent and Hobart Rogers, both past presidents of the county and state auxiliaries.

[†] As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Frank H. Rodin, Assistant Chairman of the Publicity and Publications Committee, 2457 Bay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Rodin and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

Mrs. Hayward Thomas entertained with piano solos.

Reservations were in charge of Mrs. Malcolm Hadden.

Mrs. Grant Ellis, *Publicity Chairman.*

⁂

Fresno County

Preceding the meeting on January 3, twenty members of the Woman's Auxiliary to the Fresno County Medical Association met for an informal dinner at the Magic Cupboard. The president, Mrs. C. M. Vanderburg, presided.

Mrs. R. W. Dalgren reported on the visit to the State Hospital for the Insane at Stockton.

Mrs. Guy Manson reported on the *Hygeia* benefit bridge and Christmas party. With the funds obtained, subscriptions to *Hygeia,* the health magazine, are being placed in beauty parlors, barber shops, schools, public library and clubs. Members are also passing their copies of *Hygeia* on to their friends.

During the Christmas season the members helped to fill stockings for the Indian patients of Bow-Hin-Tow, an annex of Wish-I-Ah Tuberculosis Hospital at Auberry. The chairman, Mrs. Walter J. Avery, carefully selected suitable useful gifts of pajamas, socks, slippers, gay plaid dresses, and bright shirts. These were all wrapped in separate packages with tinsel and ribbons to gladden the hearts of the patients.

The program of the evening was given by Drs. George W. Walker and A. E. Anderson, who spoke on *Socialized Medicine.*

Mrs. Charles H. Ingram, *Publicity Chairman.*

⁂

Orange County

The December meeting of the Auxiliary to the Orange County Medical Association was held at the Laguna Beach Hotel. Thirty-two members and guests met for luncheon.

The business meeting was held in the Ship Salon, overlooking the ocean, and was presided over by the president, Mrs. Hiram Currey.

The philanthropy chairman, Mrs. Harry Huffman, reported on the work of the Auxiliary. The members voted to renew twelve subscriptions to *Hygeia* and the *Readers Digest* in Braile for the blind in the county. Fruit cakes, baked and donated by one of the members, Mrs. D. C. Cowles of Fullerton, netted the Ways and Means Committee $58, to be used for philanthropy.

Two new members from Laguna Beach, Mesdames B. J. Van Doren and W. H. Whimp, were welcomed into the Auxiliary.

The following guests were introduced: Mesdames R. Emerson Bond, Vice-President, San Diego County Auxiliary; F. G. Lindemulder, Councilor for First District; Bergman of Fullerton, and Cooper of Peru.

Mrs. Kenneth H. Sutherland, Program Chairman, presented Mrs. Mona S. Smith of the Santa Anna Library, who reviewed the book *I'd Rather Be Right* by George Kaufman and Moss Hart.

Mrs. G. Wendell Olson, *Publicity Chairman.*

⁂

Riverside County

The doctors of the Riverside County Medical Association entertained as their guests the members of the Woman's Auxiliary at a delightful dinner at the Mission Inn on November 14. The president, Dr. Denver D. Roos, presided.

After dinner a most interesting and fascinating film was shown by Dr. Elmer Belt of Los Angeles, depicting the steps by which Dr. William Harvey demonstrated the circulation of blood. Another interesting film, that of a heart functioning after the patient's death, was shown by Dr. Myron Prinzmetal of Los Angeles.

* * *

The December meeting was held at the home of Mrs. Roy B. McCarty and was well attended. Mrs. W. W. Roblee, President, presided.

Following the business meeting a most interesting talk was given by Dr. Frances Keller Harding on *Medicine Down Under.* She also showed a film of the Fiji Islands. Dr. Frances K. Harding and her husband, Dr. Warren Harding, II, have practiced medicine in Australia for five years.

Mrs. A. W. Walker, who was the first president of the Riverside County Auxiliary and has served on the State Auxiliary Board, was presented with a wrought-metal tray. Mrs. Walker is leaving Riverside to reside on their ranch in Vista, California, and will be missed by the Riverside Auxiliary.

At the conclusion of the meeting the doctors of the Medical Association joined the ladies for a social hour and refreshments. The hostesses were Mesdames Ray McCarty, Bon O. Adams, and S. H. Keller.

Mrs. T. A. Card, *Publicity Chairman.*

⁂

San Diego County

The members of the Woman's Auxiliary to the San Diego County Medical Association met for luncheon on December 13 at the University Club. Eighty members and guests attended.

A short three-act comedy, very capably written by Mrs. Willard Newman, and directed by Mrs. Phraser McPherson, was presented. The dramatic treat, entitled *How Do You Like Your Medicine?* or *Can You Take It?,* was warmly accepted and much enjoyed by all. Dealing with the subject of medicine past, present, and future, it brought many laughs. The cast, author and director, all members of the Auxiliary, agreed it was worth all their efforts.

Mrs. H. K. Albertson, *Publicity Chairman.*

⁂

San Joaquin County

The January meeting of the Woman's Auxiliary to the San Joaquin County Medical Association was held at the home of Mrs. G. H. Rohrbacher. Mrs. G. K. Weaver, President, presided. Sixteen members were present.

An interesting talk on the *Function and Needs of the Juvenile Court in the Field of Child Guidance* was given by Miss Eileen Clark of the Juvenile Court.

The meeting concluded with the serving of delicious refreshments.

Mrs. G. K. Weaver, *President.*

NEVADA STATE MEDICAL ASSOCIATION

W. H. FROLICH, East Ely	President
C. W. WEST, Reno	Vice-President
HORACE J. BROWN, Box 698, Reno	Secretary-Treasurer

Minutes of the Thirty-Fifth Annual Meeting of the Nevada State Medical Association, Held at Reno, Nevada, September 23 and 24, 1938

I. Scientific Program

The thirty-fifth annual meeting of the Nevada State Medical Association was called to order at 9:45 a. m. on Friday, September 23, 1938, at Bowers Mansion, with President Harry W. Sawyer in the chair.

The first order of business was the address of President Sawyer on "Medico-Economic Problems."*

The scientific program was then taken up.†

At the conclusion of the scientific program recess was taken for lunch, which was served in the patio at Bowers Mansion.

II. Business Meeting

The meeting was called to order at 2: 30 p. m. by President H. W. Sawyer.

Report of Various Committees

Dr. J. La Rue Robinson offered the following remarks at this time:

Resolution No. 1

Whereas, The Nevada State Medical Association hereby affirms its willingness to coöperate at all times with the proper authorities in order to secure adequate medical care for all indigent persons, but at the same time is convinced that such care is distinctly a community responsibility and is properly a function of the local governmental unit and local medical profession; therefore, be it

Resolved, That the Nevada State Medical Association, in justice to the medical profession of the state, hereby records its opposition to and its unwillingness to coöperate in any plan that involves federal supervision and control of medical practice in the United States, and will combat this with every means at its command.

Dr. Robinson: Personally, I think the President's talk this morning is the keynote of whether you want to adopt that policy or not. This is very ambiguous. We are still offering our services to the indigent, but with a string on it. Personally, I feel like Doctor Sawyer—that evolution and times have changed whereby the physician should agree with the Government, which is trying to blow this $850,000,000. I have always felt, and Doctor Creveling knows I have argued, if the doctors don't do something the laymen will do it for you. Why not step up and organize some sort of program and get a fair remuneration for everything you do? It is the public's duty to pay for their injuries; they always have, but they have done it in a poorhouse way instead of a professional way. I think this resolution that we passed last year doesn't mean anything at all. Mr. President, to bring the matter to a head, I think the sentiments that you expressed in your speech this morning should be adopted by the Society as their feeling toward the Government entering into the medical field with that $850,000,000, and with emphasis put on the fact that the physicians should be brought to the fore in planning and in distribution of this money and for the building of necessary rather than unnecessary hospitals for hospitalization and give the help where it is really needed and can be used at the discretion of the doctors. . . .

The question has come up, are we going to adopt the Constitution and By-Laws in accordance with the American Medical Association and follow their plan and incorporate as a nonprofit organization? That question has come up in Minnesota. The Government is now suing the American Medical Association for monopoly, and this is our suggestion: If this Association is going to adopt this we shall probably proceed to incorporate under the state laws of Nevada.

Dr. H. W. Sawyer: Under the heading of "New Business," this is a proposed constitution and by-laws. The business before this meeting this afternoon is to read and accept or reject in all or in part this proposed constitution and by-laws.

Dr. A. R. Da Costa: We have been running for years without any constitution and by-laws. Our secretary was unable to find any by-laws of any kind. A few amendments have been passed from year to year, so it was necessary to start from scratch. We got copies of the proposed by-laws for state associations from the American Medical Association. These could not be followed altogether by our Association. They have a House of Delegates, and we have not. In some parts we have had to go as far as we could following the American Medical Association and then put in what we thought was necessary for this society. Doctors Creveling and Sullivan were on this committee with me, and these have been approved by the committee.*

After hearing the report of the Committee on Constitution and By-Laws—A. R. Da Costa, Earle E. Creveling, and John J. Sullivan—Doctor Da Costa made a motion that the by-laws, with the corrections, be adopted. The motion was seconded by Doctor Creveling. Carried, and so ordered.

Dr. Da Costa: I move that this society, the president, first vice-president, and secretary constitute a committee to incorporate this society, with whatever expense there is to be borne by the treasury. The motion was seconded by Doctor Creveling. Carried, and so ordered.

Dr. Sawyer: It is now time to take up unfinished business. I shall turn that over to you, Doctor Robinson.

Dr. Robinson read the following letter from the California Medical Association which was addressed to Dr. Horace J. Brown, Secretary, Nevada State Medical Association:

Your letters concerning coöperation by the California Medical Association with the Nevada State Medical Association were submitted to the Committee on Public Relations at its meeting held on August 27, 1938.

For your information, that committee voted to recommend that the Council of the California Medical Association authorize a plan whereby it would be possible for the Nevada State Medical Association to secure for its members subscriptions to California and Western Medicine. The subscription price to be on an estimated cost basis of $3 per member. The additional stipulations were as follows:

1. That the Nevada State Medical Association shall pay the sum of $3 for every member of its Association in order that a copy of California and Western Medicine may be sent to each Nevada State Medical Association member.

2. That the transactions of the annual session of the Nevada State Medical Association and of its component county societies would be printed under the same regulations as apply to California Medical Association sessions.

3. Concerning papers read at an annual session of the Nevada State Medical Association, the same rules for acceptance and publication will hold as apply to papers read at an annual session of the California Medical Association.

In your letter you stated you would hold a meeting at Reno on September 23 and 24, and I am therefore sending you this informal memorandum in order that your constituted authorities may consider the same.

With all good wishes for a successful annual session,

Cordially and fraternally,

(Signed): George H. Kress, M. D.,
Secretary.

A motion was made by Doctor Robinson that the Association go on record as having all members subscribe, at $3 per member, to receive California and Western Medicine, and to have it the official publication. The motion was seconded. Carried, and so ordered.

Doctor Robinson then read a letter from the Nevada Tuberculosis Association in which they listed their operations and asked for the Association's coöperation and approval. Doctor Robinson made a motion that the Nevada State Medical Society endorse the activities of the Nevada Tuberculosis Association. The motion was seconded by Doctor Paradis. Carried, and so ordered.

Doctor Robinson read a letter from J. O. Thorpe, General Manager of the Intercoast Hospitalization Insurance Association. He then made a motion that the Association endorse this plan. The motion was seconded. Carried and so ordered.

New Members.—The Secretary presented the names of several applicants for membership, which were as follows:

---

* Address of President H. W. Sawyer appeared in California and Western Medicine, January, 1939, on page 20.

† For titles of papers with names of authors, see California and Western Medicine, January, 1939, on page 56.

* Draft of the proposed by-laws was then submitted.

Drs. Arthur Floyd Gardner, Theodore Verner Ross, Bard Sherman Berry, Arthur F. Goodyear, John Edward Hughes, Lemuel R. Brigman, and Leo Frank Corvino. The aforesaid applicants were unanimously approved. Doctor Da Costa made a motion that the name of Doctor Lang be included in the names of the applicants and that he be requested to fill in a formal application. The motion was seconded. Carried, and so ordered.

Honorary Members.—Following the usual procedure, all essayists not already members were elected to honorary membership in the Nevada State Medical Association.

Election of Officers.—The election of officers being next in order, the President called for nominations. Dr. W. H. Frolich of East Ely was nominated for president by Dr. Creveling and seconded by Dr. Moulton; Dr. C. W. West of Reno was nominated for president-elect by Dr. Creveling and seconded by Dr. Da Costa; Dr. H. A. Paradis was nominated for the office of first vice-president; Dr. George McGee was nominated for second vice-president; and Dr. Horace J. Brown of Reno was nominated for secretary-treasurer.

Trustees.—Under the new constitution, Dr. R. P. Roantree of Elko was nominated for the three-year term, Dr. Fleet H. Harrison of Reno for the two-year term, and Dr. Earle L. Creveling of Reno for the one-year term.

There being only one person nominated for each position, the above-named doctors were unanimously elected to the office for which they were nominated.

Doctor Robinson advised that Dr. Horace Brown had recommended that Dr. Fleet H. Harrison be made a life member without the payment of dues. This was put in the form of a motion by Doctor Moulton and was seconded by Doctor Robinson. Carried, and so ordered.

A motion was made by Doctor Paradis that the next annual meeting be held in Reno. The motion was seconded by Doctor Piersall. Carried, and so ordered.

There being no further business the meeting adjourned at 4:30 p. m.

* * *

The following members were in attendance at various times during the session:

H. W. Sawyer, W. H. Hood, Fallon; V. M. Cobb, J. H. Stickler, Stewart; T. S. Bambauer, Bishop, California; Bard S. Berry, E. E. Hamer, James Thom, John E. Worden, Carson City; W. H. Frolich, East Ely; W. M. Ririe, Ruth; C. E. Secor, Elko; Anna Dechene, San Francisco, California; George McGee, Yerington; F. M. West, Lovelock; J. E. Hughes, Winnemucca; J. R. Weisser, Hawthorne; Robert R. Craig, Tonopah; G. S. Martin, Susanville, California; Ernest G. Hand, Gardnerville; J.LaRue Robinson, Harry E. Fightlin, George L. Servoss, Earle L. Creveling, A. E. Landers, J. A. Norton, George A. Cann, Fleet H. Harrison, L. R. Brigman, H. Earl Belnap, C. E. Piersall, Lawrence Parsons, J. A. Fuller, O. C. Moulton, A. R. Da Costa, Arthur F. Goodyear, T. H. Harper, C. W. West, J. P. Tuttle, S. K. Morrison, William Cann, Dwight L. Hood, F. W. Scott, Leo F. Corvino, T. C. Harper, John J. Sullivan, Louis E. Lombardi, Reno; C. D. Lambird, H. A. Paradis, Sparks.

* * *

The following honorary members and visitors were also present at various times during the session:

R. A. Cushman, Talmage, California; A. R. Kilgore, Miley B. Wesson, Leo Nannini, Ernst Gehrels, San Francisco, California; W. H. Daniel, Robert E. Henry, R. N. Smiley, Los Angeles, California; Albert H. Rowe, W. W. Wiley, Oakland, California; C. G. Newburker, Hanford, California; R. P. Landis, Grass Valley, California; John A. Cooper, Mayor, W. E. Pettis, E. C. Whiting, Lester J. Hilp, Reno; W. B. McKnight, Portola, California; Joseph E. Tillotson, Colusa, California; J. B. Rackerby, Joe Wicarius, John H. Lamberg, E. Benjamin, A. J. Afflich, H. W. Shiell, J. O. Thorpe, Sacramento; Lee H. Townsend, Piedmont, California.

* * *

Nevada State Medical Association Committees:

Judicial—H. W. Sawyer, Fallon; E. E. Creveling, A. R. Da Costa, H. J. Brown, J. P. Tuttle, V. A. Muller, Reno.

Program—H. J. Brown, Reno; O. Hovenden, McGill; C. E. Secor, Elko.

Military Affairs—R. P. Roantree, Elko; F. R. Mildren, Las Vegas; Dwight Hood, Reno; T. J. Bluechel, Minden.

Necrology—Mary Fulstone, Smith; J. N. Van Meter, Las Vegas; J. J. Sullivan, Reno.

Public Health—E. E. Hamer, Carson City; J. A. Norton, B. H. Caples, Reno.

Entertainment—S. K. Morrison, O. C. Moulton, T. C. Harper, Reno.

Industrial Health—R. A. Bowdle, East Ely; R. R. Craig, Tonopah; O. Hovenden, McGill.

Council—H. K. Wilson, Fallon; J. R. McDaniel, Jr., Boulder City; E. G. Hand, Gardnerville; A. J. Hood, Elko; G. J. Sylvain, Goldfield; D. J. Hurley, Eureka; J. E. Hughes, Winnemucca; J. H. Hastings, Pioche; G. R. Magee, Yerington; D. A. Smith, Mina; H. J. Valenta, Tonopah; James Thom, Carson City; Alex Coblentz, Lovelock; John A. Fuller, Reno; G. O. Bradley, Ely.

HORACE J. BROWN, *Secretary-Treasurer.*

Environmental Causes of Eczema.—The most striking fact about infantile eczema is the part that environment plays in its production and cure, Marion B. Sulzberger, M.D., New York, says in *The Journal of the American Medical Association* for January 7.

Environmental allergens include particularly house dust and the substances coming from pillows, mattresses, bedding, rugs, draperies and dyed and colored furnishings. It is therefore expedient to remove all sources of such dusts.

The room should be as bare as barracks, with washable walls and floors, if possible. An iron cot with a sterilized horsehair mattress and plain, painted wooden chairs should constitute the bedroom furniture. If kapok and feathers cannot be removed, the mattress, pillows or other articles containing these allergens should be covered with so-called allergen-proof covers.

Whenever possible, these precautions should be taken as a routine not only because they sometimes result in striking improvement of the eczema but because some infants with eczema are potential candidates for future respiratory allergy, in which these environmental dusts may be of prime importance.

If after a reasonable trial of local application of salves or ointments any case of infantile eczema does not improve, it is advisable to eliminate, one by one, such potential common dietary causes as cow's milk, wheat, eggs, citrus fruits, spinach, peas, tomatoes, fish and fish products.

All remedies recommended for local therapy of infantile eczema generally consist of tar, mercurials, resorcinol and sulfur—in manifold forms and combinations—and of these crude coal tar or one of its derivatives is the acknowledged best.

Scratching, because of intense itching, should be prevented through tying of hands and feet, through splints, by means of metal cups on the hands or by the use of mild sedatives. Proper splinting and tying of the hands and feet may at first seem cruel, but these measures are often the kindest in the long run, as they prevent scarring and possible secondary infection.

"Eczemas" of various types, forms and causes, rank with the common cold and acne as perhaps the most frequently encountered of all human ills. The skin is not only the most delicate and the most exposed organ; it is also that organ which protects the individual from the outside world, and helps to adapt him to his environment.

All the new substances of the outside world—dust, feathers, wool, silk, animal emanations, gases, vapors, cleansing agents, caustics (soaps!)—begin their onslaught on the skin of the newborn infant, which must also adjust itself to the varying physical forces—heat, cold, light, moisture, friction, pressure.

The hordes of living microörganisms—fungi, bacilli, cocci and viruses which begin to settle on the surface of the skin and take up their activities there—must be controlled and resisted. In addition to all these external attacks, the skin must learn to cope with the products of diet and digestion and of substances absorbed by inhalation.

Any considerable change in weight, either by addition or reduction, should not be attempted without consulting a physician.—*Hygeia.*

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, St. Louis, Missouri, May 15 to 19, 1939. Olin West, M. D., Secretary, 535 North Dearborn Street, Chicago, Illinois.

California Medical Association, Hotel Del Monte, May 1 to 4, 1939. George H. Kress, M. D., Secretary, 450 Sutter Street, San Francisco.

One-hundredth Semi-Annual Meeting of the Southern California Medical Association, Los Angeles, March 15 and 16, 1939. John B. Doyle, M. D., Secretary, 1930 Wilshire Boulevard, Los Angeles.

Medical Broadcasts*

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of February is as follows:

Thursday, February 2—KECA, 10:45 a. m., The Road of Health.
Saturday, February 4—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, February 9—KECA, 10:45 a. m., The Road of Health.
Saturday, February 11—KFI, 8:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, February 16—KECA, 10:45 a. m., The Road of Health.
Saturday, February 18—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, February 23—KECA, 10:45 a. m., The Road of Health.
Saturday, February 25—KFI, 9:00 a. m., The Road of Health; KFAC, 11:30 a. m., Your Doctor and You.

Memorial to Dr. Joseph Pomeroy Widney, Founder of the Los Angeles County Medical Association.—On Wednesday morning, December 7, 1938, memorial services for Dr. Joseph Pomeroy Widney were held on the campus of the University of Southern California.

Services were under the auspices of the Conservation Committee of the Eschscholtzia Chapter of the Daughters of the American Revolution.

A memorial tablet, inscribed

Joseph P. Widney, M. D.
Patriot, Scholar, Pioneer
President, University of Southern
California, 1891–1896

was unveiled by Mrs. Samuel A. Widney.

Dr. Rufus B. von KleinSmid, President of the University of Southern California, accepted the memorial and paid tribute to Doctor Widney.

Members of the Los Angeles County Medical Association attended the ceremony in honor of Doctor Widney, motivating leader of the founders of the Association. Biographical and other sketches concerning the late Doctor Widney have appeared in previous issues of CALIFORNIA AND WESTERN MEDICINE. (See issues of April, May, June, 1936; and August, 1938, on pages 106 and 161.)

Ancient Judean Medicine Similar to Modern Type.—The medical practitioners of ancient Judea had theories and techniques on infections and their results that appear surprisingly modern, it is revealed in a rare volume that has come to the Crummer Room library of the University of California Medical Center here. The volume, written early in the eighteenth century by Dr. John Jacob Schmidt, a German physician, is titled "Medicine and the Bible," and is a collection of all references to disease and remedies that occur in the Old Testament.

Resident Physician Wanted.—There will be an opening for resident physician at the Alameda Sanatorium, Alameda, California, beginning July 1, 1939.

Seventy-five bed, private hospital with a daily average of forty patients, including all services except contagion and mental. Salary of $125 and full maintenance. Duties to include histories and physicals on patients and their routine follow-up care under supervision of the attending physician, and also the giving of occasional anesthetics. Some opportunity for assisting in surgery. License in California obligatory. Anyone who would be interested in the position will please communicate with Ruth A. Wescott, Superintendent, for further information.

Rôle of the Neutron. — The neutron, discovered by Chadwick, and of special interest because it carries no electric charge, can now be obtained in a beam available for direct use as a possible future form of radiotherapy. An apparatus, called the cyclotron, for the production of this beam is described in the *Journal of the Canadian Medical Association* for March, 1938, by Prof. J. Stuart Foster of McGill University. The cyclotron, which is comparatively simple in design, depends in principle on the fact that given certain conditions the ions circulating in a magnetic field can be rapidly accelerated so that they finally strike a target with an energy of five and a half million volts. The fact that it is simple in design does not mean that the cyclotron is easy to construct or operate. The bottom section of the electromagnet weighs eighty-five tons, and the intensity of the primary cyclotron beam is enormously greater than that from any other known source of radio activity. The beam has two possible therapeutic applications—for the direct radiation of patients and for the production of new nuclear forms such as radio-sodium. This has a half-value period of fourteen and eight-tenths hours, and finally loses all radio-activity and passes to a magnesium nucleus of mass 24. The magnesium nucleus is formed in an "excited" state, but becomes normal immediately with gamma-ray emission, ordinary sodium being thus turned into ordinary magnesium as a result of activation by the cyclotron beam. Trial of the neutron beam for the actual treatment of malignant disease may be expected. E. and J. Lawrence at Berkeley are already carrying out biological experiments with tumor implants in mice and other subjects. The use of radio-sodium to make "bombs" is suggested by Prof. Stuart Foster, and since radon has been used in this form for many years in certain American clinics, the idea does not seem to be beyond practical possibilities. The biological effects of neutron beam are already being studied in this country in the hope of extending the scope of radiation therapy.—Extract from *The Lancet,* London, May, 1938.

---

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

East Bay Hospital Conference.—Alfred E. Maffly, Superintendent of the Berkeley General Hospital, recently was elected president of the East Bay Hospital Conference, succeeding Ellard L. Slack of Samuel Merritt Hospital. The new vice-president is Miss Florence Klaeser of East Oakland Hospital, and the new secretary-treasurer is John Rafter of Richmond Cottage Hospital.

The East Bay Hospital Conference is composed of all the hospitals in the East Bay area which maintain the standards approved by the American College of Surgeons. Its membership includes the following hospitals: Alameda County, Alameda Sanatorium, Alta Bates, Berkeley General, Children's, Cowell Memorial, East Oakland, Fairmount, Samuel Merritt, Peralta, Providence, and Richmond Cottage hospitals.

American Board of Obstetrics and Gynecology.—The general oral, clinical and pathological examinations for all candidates, Part II Examinations (Groups A and B), will be conducted by the entire Board, meeting in St. Louis, Missouri, on May 15 and 16, 1939, immediately prior to the annual meeting of the American Medical Association. Notice of time and place of these examinations will be forwarded to all candidates well in advance of the examination dates.

Candidates for reëxamination in Part II must request such reëxamination by writing the secretary's office before April 1. Candidates who are required to take reëxaminations must do so before the expiration of three years from the date of their first examination.

Application for admission to Group A, May 1939, examinations must be on file in the secretary's office by March 15.

Application blanks and booklets of information may be obtained from Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh, (6) Pennsylvania.

Paris Physicians Protest Against Social Insurance.—The abuse of free medical care by the public hospitals and dispensaries and the illegal extension of the original function of the social insurance authorities are arousing the French medical profession to make a vigorous campaign to put an end to a movement which renders it difficult for physicians to earn a living, the regular Paris correspondent of *The Journal of the American Medical Association* reports in the December 10 issue. In the notice sent out by the association of physicians in the department of the Seine, in which Paris is situated, for a meeting to be held on November 4, 1938, the following plea was made for a full attendance:

It is becoming more and more difficult, in fact almost impossible, to practice in Paris and the adjacent areas.

The public hospitals and dispensaries, which are not subjected to the excessively high taxes which physicians must pay, are doing all they can to give free medical attention without any inquiry as to the ability of the sick to pay. Such institutions should treat only indigents.

The social insurance organization was created to insure the worker earning up to a certain sum annually, now 30,000 francs, so that he might be able to pay for medical care. Instead of limiting their activities to this commendable objective, the social insurance authorities have begun to make serious inroads on the work of private practitioners by attempting to organize facilities for treating the insured worker. Every effort is being made to turn the insured from specialists and general practitioners by urging them to enter public hospitals or receive treatment at the many public dispensaries.

The situation has become so acute that the time has arrived for a more energetic campaign against these abuses, which make it impossible for a physician, after many years of preparation, to compete with the tendency toward state medicine.—*American Medical Association News.*

Army Examination Set for Doctors.—Young doctors who wish to qualify for appointments as first lieutenants in the Medical Corps of the regular army will have an opportunity on March 20 to 24, the War Department announced today.

Examinations will be held to fill vacancies occurring during the next calendar year.

Male graduates of acceptable medical schools who have completed one year's internship in an approved hospital, or who will have completed internship by June 30, are eligible. Doctors must not be over thirty-two years of age.

The examination will consist of physical and written subjects.—San Francisco *Call-Bulletin,* December 31, 1938.

State University Plans Classes for Teachers of Blind. Coöperating with the National Society for the Prevention of Blindness, the University of California will include special courses for the preparation of supervisors and teachers of sight-saving classes in its 1939 Summer Session curricula at Los Angeles, according to an announcement made recently by Dr. J. Harold Williams, Dean of the Session.

To give instruction in the administration, supervision and teaching of sight-saving classes, Miss Frances Blend, Principal of the School for the Blind and Sight-Saving in Los Angeles, will join the Summer Session faculty. In addition, special lectures will be given by specialists on ocular problems and students will be given an opportunity for observation in a demonstration class and clinical work in an eye hospital.

Summer Session work begins on the Los Angeles campus of the State University on June 26, with preliminary class bulletins currently available to the public.

Worry and Its Cure.—Clinical proof of the saying that worry causes more deaths and general misery than war, but does so needlessly in many cases, was offered to the staff of the Mayo Clinic in Rochester, Minnesota, by Dr. William J. Kerr, head of the department of medicine of the University of California Medical Center, in a recent invitational address.

Blasted romances, business deals that go wrong and the feeling of lack of personal security, have been determined as the chief causes of the destructive anxiety state in humans, as a result of studies extending over many years, Doctor Kerr said. Withal, the cure appears to be relatively simple, once the patient is aware of the real cause of his condition and takes measures to check that cause.

Characteristic symptoms are overbreathing, which might also be termed too much sighing, which causes the loss of so much carbonic acid gas from the blood that alkalosis sets in, muscular spasms, cramps, palpitation of the heart, trembling, weakness, sweating, numbness of extremities, occasional dizziness and sensations of bands around the head and the neck. These symptoms may be made worse by taking the alkaline substances so often recommended. Relief can be obtained almost invariably if the patient can be shown that anxiety is bringing on the remainder of the symptoms. While it may not be possible to remove the cause of the anxiety, a correction of the overbreathing can bring relief. Avoidance of the alkaline substances and the substitution of acid substances, such as meats, butter and cream, therefor make it more difficult for the symptoms to arise. Sedatives sometimes have a temporary value, but should be taken only as a last resort.

The well-known "soldier's heart," experienced widely during the World War, was merely functional change brought about by the anxiety state, but appearing in more pronounced fashion than in civil life, Doctor Kerr explained.

Doctor Kerr was associated in the study with Dr. Paul Gliebe, psychiatrist, and Dr. Mayo Soley, of the Medical School faculty, Dr. James Dalton of Santa Barbara, and Dr. Nathan Schock of the department of physiology, Berkeley.

Child Institute Receives Grant for Research.—Grants totaling $190,000 have been awarded by the General Education Board of New York for support of the research program at the Institute of Child Welfare of the University of California, according to word received by Dr. Robert G. Sproul, President of the University.

A lump-sum grant of $180,000 has been made for the support of child-guidance studies at the Institute and an additional grant of $10,000 has been provided for use in the general research activities. The entire program is to be under the direction of Dr. Harold E. Jones, director of the Institute.

The Institute research program is devoted to uncovering the methods of mental and physical growth as well as the development of personality characteristics in children.

Ten Commandments of Careful Driving Announced by California Safety Council.—The California Safety Council, a state-wide citizens' safety educational group, recently announced a campaign for careful driving during the holidays to reduce street casualties.

"Ten Commandments of Careful Driving," issued by the Safety Council, are calculated to eliminate hazardous driving and walking and insure a holiday season of prudent driving, in which all California citizens are invited to participate.

Here are the rules:

1. I shall not drive if I imbibe in holiday or party "cheer."
2. I shall not be rude or boorish to pedestrians attempting to cross the street ahead of me, but give them clearance to cross safely.
3. I shall not weave in and out of traffic.
4. I shall not blind approaching motorists at night with my headlights.
5. I shall not hog the middle of the road.
6. I shall not fail to give proper arm signals when turning or stopping my car.
7. I shall not follow too closely the car or truck ahead.
8. I shall not jump signals.
9. I shall not operate my car at excessive speed.
10. I shall obey all traffic regulations, recognizing that my conformance thereto means better "road manners" and less occasion for hazards to emerge.

California Hospital Historical Brochure: "California Hospital Messenger."—Volume 16 of the "Messenger" is a fifty-year memorial number. On its pages may be found references to the group of physicians who in the last half-century played a prominent part in public health and medical practice activities in the southern section of California. For many years the attending staff of senior physicians of the California Hospital, 1414 South Hope Street, Los Angeles, consisted of doctors of medicine who were practically one and the same as the physicians who composed the faculty of the old College of Medicine of the University of Southern California, located on what was then Buena Vista Street, now North Broadway. On page 5 of "The Messenger" is a reproduction of a photograph of the faculty members, and among the twenty-one physicians are the following former presidents of the California Medical Association (former name, Medical Society of the State of California): Henry S. Orme (1878), Walter Lindley (1889), W. Le Moyne Wills (1895), Henry G. Brainerd (1922), and Granville MacGowan (1924).

Four other physicians who, for many years were intimately identified with the California Hospital, and each of whom was likewise a president of the California Medical Association, are H. Bert. Ellis (1903), W. W. Beckett (1908), George H. Kress (1916), and William T. McArthur (1926).

Financial Grants for Cancer Research.—Financial grants for cancer research in designated hospitals and medical colleges were recently considered by the National Advisory Cancer Council at the National Institute of Health.

Distribution plans for the $200,000 shipment of radium which recently arrived in Washington were included in the reports. The nine and one-half grams owned by the Institute are now being tested at the Bureau of Standards. Within the next several months most of this radium will be loaned out in small quantities to hospitals, cancer clinics, and medical centers, in accordance with regulations approved by the Council at its October meeting.

A Symposium on the Public Health Significance of the Virus and Rickettsial Diseases.—The faculty of the Harvard School of Public Health offers a short course of lectures, clinics, and demonstrations on the virus and rickettsial diseases, with special emphasis on their public health significance, to be held at the School during the week of June 12 to 17, 1939. Lectures on the etiology, epidemiology, and methods of control of these diseases, given by members of the faculties and by former students of the Harvard School of Public Health and of the Harvard Medical School, will occupy five mornings. Special clinics and demonstrations will be given each afternoon. In some instances these demonstrations will be continued through the week, so that all the members of the symposium can attend. On the last morning, a panel discussion will be held on the three main topics presented in the symposium.

The fee for the course will be $25, payable at any time up to June 12. Enrollment, however, should be arranged before June 1, as facilities for many of the clinics and demonstrations are limited. The lectures will be published later in a single volume, which will be sent to each person who has registered for the course.

Further information may be had by writing to the Secretary of the School of Public Health, 55 Shattuck Street, Boston, Massachusetts.

Scientific Methods in Disease Control.—Wider application of the methods of science in disease control, greater emphasis on health education, and extension of group activity, both in the practice of medicine and in medical research, were predicted recently by Dr. R. R. Spencer, Executive Assistant of the National Cancer Institute, United States Public Health Service, in an address in Philadelphia before the third annual convention of the Association of Medical Students.

"We are going to see the methods of science applied to the problems of society and the physician will have an important part in solving these problems," Doctor Spencer declared. "Medicine is a social science. It deals with people and their behavior, as well as the behavior of our heart, stomach, thyroid, liver, or kidneys. If science can deal effectively with the misbehavior of our organs, it should be able to deal effectively also with the misbehavior of the organism as a whole."

In commenting upon his predicted expansion of health education, Doctor Spencer said that "preventive medicine will some day be the heart and soul of medical practice, and the heart and soul of preventive medicine is health education." He pointed out that, even today, every medical society has a speakers' bureau and a public relations committee, and commended health education efforts in behalf of preventive medicine because "preventive medicine is far more satisfactory to the patient, to the physician, and to the community than curative medicine. It is less spectacular, but in the long run it is cheaper."

In advocating a closer connection between health education and general education at all levels, including schools, colleges, universities, and classes of mass adult education, the Public Health Service official declared: "You cannot separate health education from the general business of living. Hence, the duties of the public health physician and the school teachers are merging.

"Extension of medical care does not necessarily mean political domination. It should simply mean good organization, and I do not believe good organization means regimentation and the killing of initiative. It should, on the contrary, release initiative, for good organization is synonymous with teamwork and *esprit de corps,* and a trust in what John Dewey has called 'coöperative intelligence.' An enlightened public is demanding a high type of medical care which can be provided only by group practice and the establishment of health centers.

"The day of individualistic competitive medical methods is rapidly passing. Many diseases formerly taken care of by the individual physician have now become major public health problems. Mental diseases, tuberculosis, syphilis, pneumonia, and cancer are included in this group."

A "New" Disease.—As yet unnamed, a new disease of mankind, caused by a recently recognized virus, may soon be added to the long list already known. The infection is found in nature in the Rocky Mountain wood tick, a species native to Montana.

The identity of this infectious agent with the little-known "Q" fever of Australia is suggested by Dr. R. E. Dyer, Senior Surgeon, United States Public Health Service, in one of the series of studies on the new virus appearing in Public Health Reports (December 30, 1938).

In 1926, a filter-passing agent was recovered from a species of tick near Missoula, Montana, by Noguchi; again, nine years later, a virus, possibly the same as Noguchi's, was again recovered from approximately the same locality. This time, Doctors Gordon E. Davis and Herald R. Cox, Bacteriologists of the Public Health Service, began experiments with the unknown strain which eventually resulted in the present reports.

Their research indicates that the new infection, which they succeeded in transferring to guinea pigs, is characterized particularly by high and continuous fever and an enlarged, smooth spleen. Later work by Dr. R. R. Parker at the Rocky Mountain Laboratory, maintained by the Federal Government, proved that the agent of infection could be passed to guinea pigs by both progeny of infected females and immature and adult ticks which had fed, as larvae, on infected blood.

Doctor Cox (in Paper III of the series), working further with the recovered strain, found numerous minute protean organisms which resembled "rickettsia," or bacterium-like forms.

The fourth paper of the series, by Doctor Dyer, reports the actual case of "X," a member of the staff of the National Institute of Health, who contracted the new disease in May of last year, while observing the research on the virus in the laboratory at Hamilton, Montana. The period of incubation is described as about ten days, with gradual onset. Mild fever sets in the third day, lasting about a week, accompanied by chills and recurrent sweating. Finger joints were recorded as "tender" for about three days. The patient returned to normal in approximately one month.

Virus recovered from "X," injected into guinea pigs, gave them a similar infection, and his serum produced definite protection against further inoculation. Other tests indicated the possibility of the new infection being similar in many respects to the newly described Australian disease.

"The possibility that this infecting agent and the one which causes 'Q' fever are closely related, as the 'one-way' cross-immunity tests indicate," Doctor Dyer suggested, "should not be overlooked. That the two diseases may not be identical is indicated by our failure to infect monkeys, while the Australian workers report them as susceptible to 'Q' fever. Epidemiologically, this latter disease has been found in Australia, particularly among workers in abattoirs and among dairy farmers. Such an epidemiological picture is not at variance with the picture of a 'tick-borne' infection, since it suggests a reservoir in animals and the existence of the infection in their arthropod parasites."

Annual Congress on Industrial Health.—The First Annual Congress on Industrial Health was held on January 9 and 10, at the Palmer House, Chicago, Dr. C. M. Peterson of Chicago acting as secretary.

The program follows:

Monday Morning, 9:45

Stanley J. Seeger, M. D., Presiding

Report of the Council on Industrial Health—Stanley J. Seeger, M. D., Chairman, Milwaukee.

Symposium on Industrial Relationships

The Physician in Industry and Organized Medicine—Irvin Abell, M. D., President, American Medical Association, Louisville, Kentucky.

The Physician in Industry and the Employer—C. D. Selby, M. D., President, American Association of Industrial Physicians and Surgeons, Detroit.

The Physician in Industry and the Employee—Loyal A. Shoudy, M. D., Chief of Medical Service, Bethlehem Steel Company, Bethlehem, Pennsylvania.

Industrial Health and the Private Practitioner—R. L. Sensenich, M. D., Trustee, American Medical Association, South Bend, Indiana.

Monday Afternoon, 2:15

Harvey Bartle, M. D., Presiding

The Program of the American College of Surgeons in Industry—Frederic A. Besley, M. D., Chairman, Committee on Industrial Medicine and Traumatic Surgery, American College of Surgeons, Waukegan, Illinois.

Uniformity in Workmen's Compensation Procedure—Voyta Wrabetz, Chairman, Industrial Commission, State of Wisconsin, Madison.

Bases for Coöperation Between Insurance and the Physician in Industry—Ambrose Kelly, American Mutual Alliance, Chicago.

A Program for Committees on Industrial Health in the State Medical Societies—A. D. Lazenby, M. D., Chairman, Committee on Industrial Health, Medical and Chirurgical Faculty of Maryland, Baltimore.

Tuesday Morning, 9:30

H. H. Kessler, M. D., Presiding

The Health and Safety Program of the United States Bureau of Mines—Daniel Harrington, Chief, Health and Safety Branch, United States Bureau of Mines, Washington, D. C.

The Public Health Interest in Industry—Federal, State, and Local—Warren F. Draper, M. D., Executive Officer, United States Public Health Service, Washington, D. C.

Industrial Health Activities by Labor Departments in the Government—Alice Hamilton, M. D., Consultant on Industrial Hygiene, Division of Labor Standards, United States Department of Labor, Washington, D. C.

Independent Programs of Investigation and Prevention—W. J. McConnell, M. D., Secretary, Industrial Hygiene Section, American Public Health Association, New York.

Tuesday Afternoon, 2:00

Leroy U. Gardner, M. D., Presiding

Industrial Surgery from the General Surgeon's Point of View—Harry Mock, M. D., Chicago.

Symposium on Medical Service to Small Industrial Plants

Statement of the Problem—Victor G. Heiser, M. D., and Donald M. Shafer, M. D., Consultants, Committee on Healthful Working Conditions, National Association of Manufacturers, New York.

The Responsibility of the Private Practitioner in Occupational Disease Control—Carey P. McCord, M. D., Director, Bureau of Industrial Hygiene, City of Detroit Department of Health, Detroit.

Means for Accomplishment—Glenn S. Everts, M. D., Philadelphia.

Methods of Appraisal—L. D. Bristol, M. D., Health Director, American Telephone and Telegraph Company, New York.

Press Clippings.—Some news items from the daily press, on matters related to medical practice, follow:

95.000 on Los Angeles Relief, Cost Growing, Says Charities Chief

There are 75,800 cases or approximately 95,000 persons, on the relief rolls in Los Angeles County, according to the report of Rex Thomson, county superintendent of charities, for the first half of the fiscal year which was filed with the Board of Supervisors recently.

Thomson pointed out that the case load was increasing annually and aged aid cases jumped from 6,000 in 1934 to 50,600 for the period ending January 15, last.

While the cost for the year of 1938-39 increased by $10,000,000, Thomson said that relief costs during the next fiscal year will again be materially increased due to the number of aged persons qualifying for old-age pensions.

Of the total case load of 75,800 aged persons receiving an average old-age pension of $32.25 per month totaled 50,600 and the current monthly disbursement was $1,630,000. Of this total, the county contributed $254,300, the state $656,900 and the federal government $718,800.

Thomson pointed out that the average payment to old-age pensioners of $32.25 per month was lower than that paid by other counties in the state. He asserted that many applicants have legally responsible relatives able to assist them, who have refused to do so. The county has no alternative but to approve the application and later seek to collect from responsible relatives in the courts, he said.

Blind aid cases in the county total 3,000 who receive an average payment of $48 per month or a total monthly disbursement of $145,000. Of this total the county contributes $49,900, the state $49,900 and the federal government $45,200. This county has 49.5 per cent of all the blind persons receiving aid in the state, according to Thomson.

Child aid cases total 4,400, calling for an average payment of $46, and a total monthly disbursement of $203,000, of which the county paid $80,000, the state $86,500 and the federal government $36,500.

* * *

Law Bars Citizen From Being Doctor

Because of a strange quirk in California medical laws, Sidney D. Leo, who has a doctor of medicine degree, recently pleaded that he was being deprived of the right to practice in California—simply because he is an American citizen!

However, he won a point in his legal battle to become a physician in California when Superior Judge Emmet H. Wilson overruled a demurrer to his suit, which asks for a writ of mandate against the State Board of Medical Examiners to compel that body to allow him to take an examination for a license.

Law Changes on Him

His action sets forth that he received his medical education in universities approved by the board in Germany and Switzerland, his doctor's degree having been conferred on him by the University of Basle in Switzerland.

While he was busy pursuing his studies in Europe, the California Medical Practice Act was amended to require that an applicant for practice in this state must first have been licensed in the country where the medical school from which he received his degree is located—if he was educated in a foreign country.

Clear Way for Trial

But Leo declared that he cannot obtain a license in Switzerland because he is an American, since that country would require that he be a citizen of Switzerland to become a physician there. However, a Swiss physician could take the California medical examination, because this state has no citizenship requirements, Leo pointed out.

Hence, he says, he is being penalized because he is an American citizen. Judge Wilson, in overruling the demurrer, cleared the way for trial of the writ of mandate suit.—Los Angeles *Herald and Express.*

Physicians to Oppose State-Ruled Hospital

Proposed Constitutional Amendment Plan Results in Counter-Proposition

San Francisco, December 29 (UP).—Vigorous opposition to a proposed constitutional amendment providing for state-supported hospital and surgical care developed today from physicians now working out a new plan of "socialized medicine" under the aegis of the California Medical Association.

Doctor Pinkham, Secretary of the State Medical Board, joined with other state officers in announcing organized medicine would fight the measure as "impractical" in case it goes to the ballot.

Plan Accepted

The medical association's own proposal for a plan of health insurance has been approved and is expected to be put into operation some time after the first of the year when articles of incorporation have been obtained.

The association's plan provides unlimited medical and limited hospital service to all subscribers, who may choose their own doctor and hospital. It will be limited to those with incomes of $2,500 a year, or possibly may be raised to include those with incomes somewhat above $3,000 a year.

The proposed constitutional amendment was sponsored by Avery Moore, formerly identified with the Townsend pension movement, and proposed to make available to the people of California "the benefits of medical science along the same lines as educational benefits are now being enjoyed."

Hospitals Opened

State hospitals (now crowded to capacity) would be thrown open to the public free and private hospitals would be reimbursed by the state for services rendered. Doctors would be placed under a single state agency which would classify some as full-time employees and assign cases and set fees for those not in the state employ.

The proposal made no specific provision for the financing of the plan but said the costs should be included in the Governor's budget after a year's trial. It was submitted to the attorney general's office for certification of title, the first step to circulating it as an initiative measure for vote at the next general election if sufficient signatures are obtained.—San Diego *Sun.*

Wants Science Applied to Human Propagation

Editor of The Bee.—Sir: A visitor to Treasure Island is greeted with the last word in scientific advancement in all that will make the exposition a success. He is impressed with the fact that science is the servant of man and administers to all his material wants.

But how about man himself? Poor old genus homo is left out in the cold. True, the medical profession administers science to the ills of man, but man himself is left to propagate in the same old catch-as-catch-can method as the cave man. Biology is the foundation of all living things on this planet, and the quality of the biology determines the quality of that particular thing. This is as true of the human family as it is of the plant or lower animal kingdom.

The dog lover, the horse fancier and the dairy man are all jealous of the quality, the biology, of the particular animal in which they are interested and insist on pedigreed animals that have been bred scientifically. Those interested in plant development apply scientific principles to the development of their particular plants. The gene is the unit of all life, and whether it be prince or pauper, pigs or potatoes, it always reacts the same in the same environment.

Science applied to the plant and lower animal kingdom has wrought marvels in improvement. Science if as intelligently applied to the human family will bring equally good results.

We are producing a great number of people of low intelligence and high fertility, and a small number of people of high intelligence and low fertility. Unless we reverse this trend we will become a decadent people.—Eugene H. Pitts, M.D., Sacramento, December 27, 1938.—Modesto *Bee and News Herald.*

Army Medic Tests Set

Candidates for appointments as first lieutenants in the medical corps of the regular U. S. Army may take their examinations March 20-24, it was announced recently.

The examinations, which consist of physical quiz, written test in professional subjects, and a determination of the candidate's adaptability for military service, will be conducted by boards of medical officers throughout the United States.—San Francisco *Call-Bulletin.*

* * *

Medical Co-Ops

"Socialized medicine," as some have been calling it, in the District of Columbia and elsewhere, is not an attractive term, nor an accurate one. The term, used to describe a regular medical service by a salaried staff of physicians to a subscribing group of patients, is becoming popular in this country, as it has long been in other capitalist countries. It is a form of the coöperative movement, already applied to many other forms of group buying and selling under private capitalism.

What this amounts to, in its purely medical aspect, is a sort of sickness insurance, guaranteeing medical care within specified limits for a definite monthly fee, and likewise guaranteeing steady employment and regular income for the physicians concerned. Millions of Americans have already availed themselves of such services, under one name or another, and the practice is growing.

It is not evident that there has been much propaganda behind this movement. It seems to have arisen as a natural thing. Medical co-ops were bound to develop, in a highly experimental age, among people of small or fixed income needing medical care, and doctors preferring salaries to an irregular and perhaps inadequate income. The usual result of such arrangements, where they are well managed, seems to be more work for doctors and hospitals and better care for patients.—Chico *Record*.

* * *

Medical "Purge"

A long legal battle over the rights of medical associations to prescribe rules governing the membership has opened with return of indictments by a federal grand jury in Washington. It is almost certain that the issue will be carried to the United States Supreme Court, if necessary. On the outcome hinges not only the character of medical practice in the United States, but also the type of service prospective patients may receive.

The public should have ample time to familiarize itself with the principles at stake, and it should endeavor to comprehend the motives prompting the indictments and the effect on American medicine if the crusade to impose state socialism in medical practice is successful. If prosecution of the medical profession seeks to break down the freedom and initiative of the practitioner and to regiment him through national political control, the public may be expected to ally itself with the American Medical Association and affiliated societies in a common defense.

If the liberal wing of organized medicine, on the other hand, institutes measures which reduce the cost of medical care to low-income groups, the major medical reform will have been achieved. In that event, the government's case probably will collapse of its own weight. Organized medicine should battle vigorously for the maintenance of the traditional relationship of doctor and patient. No service arrangement should be countenanced which does not permit full freedom in selection of a physician and equal professional rights in declining to accept a service call.

The indictment of the American Medical Association, three local medical societies and twenty-one individual physicians, charged violation of the Sherman antitrust act. The Department of Justice made charges in October that some doctors had been threatened with exclusion from certain hospitals, thus restraining their efforts to earn a living. The courts will determine the rights of medical associations to formulate rules governing the conduct of their members, an essential element in the maintenance of professional standards and ethics. The antitrust charge marks only one phase of the campaign to impose state medicine on the country.

While many physicians are aligned with a more liberal wing which opposes the extreme conservatism of most medical associations, they may feel that the prosecution scarcely comes into court with clean hands in what ostensibly is an effort to destroy standards that have been responsible for the profession's prestige. The progress of medical practice surely will be impaired if medical associations are compelled to accept all who apply and to extend hospital and other privileges to any doctors demanding them. The profession and the public have rights as well as some who assume they have been penalized for unorthodox methods.—Indianapolis, Indiana, *Star*.

New Olson Insurance Bill Likely

A health insurance plan, broader than that recently adopted by representatives of the state's 7,000 physicians in convention at Los Angeles, will be proposed by the Olson administration in January.

The Olson plan would take care of unemployables and indigents and also workers whose incomes are not greater than $5,500 annually.

Limited to $2,200

The physicians' plan would place medical care of the unemployable and indigent in the hands of the state, and confine workers benefited to those earning not more than $2,200 annually.

Assemblyman Sam Yorty of Los Angeles declared several noted physicians and health educators are studying all types of health insurance, and that the bill to be introduced by the Olson administration "will combine the best features of all."

Long a Live Issue

Health insurance has been a live issue in legislative circles for a number of years. In the 1935 session, a leading question was whether state-wide health insurance was practical. The legislature failed to decide.

In 1937 the issue had swung around to voluntary insurance and how it should be handled. During the interim periods, voluntary insurance made headway and agitation for state health insurance increased.—Woodland *Democrat*.

Free Hospital Plan in State Proposed

Avery C. Moore, a Berkeley attorney and former organizer for the Townsend movement, announced he would sponsor a constitutional amendment that would enable all hospitals in California to be supported, in whole or in part, by taxes and make medical facilities available to all citizens in a manner similar to the present setup, which provides free education.

Moore said he had drawn up his proposed amendment and had sent it to Attorney General U. S. Webb for title.

A commission of nine members, entirely separate from the State Board of Health, would administer the projected free medical aid program.

Under the amendment, present private hospitals would be compensated by the state for services and the commission would buy or build sufficient other hospitals to take care of all the sick. Physicians, surgeons, dentists, registered nurses and others would also be under the health commission's jurisdiction.—San Francisco *Call-Bulletin*.

State Aid Medical Bookie War Seen

Officials View Program as Impracticable

Sacramento, December 28 (UP).—State officials tonight said that a proposed constitutional amendment which would provide for state supported medicine and surgery would be impracticable and would be opposed vigorously by the medical profession.

The proposal was submitted to the attorney general's office for certification of a title, the preliminary step to circulating it as an initiative measure to be voted upon at the next general election.

It was sponsored by Avery Moore, Oakland, who formerly was identified with the Townsend pension movement. It proposed to make available to the people of California "the benefits of medical science along the same lines as educational benefits are now being enjoyed."

State hospitals would be thrown open to the public free and private institutions would be reimbursed by the state. All medical practitioners would be placed under a single state agency which would classify some as fulltime salaried employees of the state and assign cases and set fees for those not in state employ.

Harry Lutgens, state director of institutions, when informed of the proposal, pointed out that the seven present state hospitals were crowded to their capacity of 22,000 patients and had no room for more. He said present patients pay an average of $20 monthly for treatment, returning about $4,000,000 to the state general fund. But the cost of maintaining the institutions is $14,000,000 biennially and an additional $6,000,000 was spent for construction in the current biennium.

Dr. C. B. Pinkham, Secretary of the State Medical Board, said that medical groups would oppose the plan vigorously.

He said that the various medical groups presently were controlled by individual governing boards having separate requirements.

The initiative as offered to the attorney general made no provision for immediately financing the plan, specifying that funds should be included in the budget by the Governor after a year's trial had determined the cost of maintaining the proposed program.—Los Angeles *Daily News*.

Colusa County Opens Hospital to All Doctors

Many Officials Are Sworn to Posts in Superior California Towns

Colusa (Colusa County), January 4.—The Colusa Memorial Hospital, long known as a hospital in which a select few physicians were allowed to practice upon approval of the Colusa County Board of Supervisors, has been thrown open to all licensed doctors and dentists of the county by a new set of rules adopted by the Board of Supervisors.

Surgeon Renamed

Dr. Joseph Tillotson has been returned for another year as the hospital surgeon.

Miss Barbara Stephenson, whose régime as superintendent of nurses at the hospital was criticized by the Hospital Committee of the Colusa County Grand Jury late last month, was returned to that position for another year.

Dr. H. S. Powis, Arbuckle osteopath and hospital owner, was elected county health officer to succeed Dr. Ney M. Salter of Williams.

Dr. Charles A. Poage, former president of the Colusa County Health Unit, was named county physician.

The supervisors made it possible for the hospital surgeon to have downtown offices for the care of his private pay patients. Heretofore the hospital surgeon gave his entire time to the institution.

Indigents Get Priority

The rules also fix the priority of use of the operating room and facilities, giving indigents first use, veterans and dependents second place and pay patients third place.—Sacramento *Bee.*

Other Editors Say—

Medical Health Insurance—More important than the particular form of low-cost health insurance that the California Medical Association plans to launch is the fact that it is instituting some form. This means that the prejudices of a conservative profession have been overcome in this state at least, and a successful experience with the plan adopted here would certainly mean that medical societies in other states would follow suit.

The plan naturally must be launched somewhat experimentally. Its institution therefore must be marked by caution. It must feel its way, not attempting too much at the outset. This evidently is the policy to be pursued.

While it is the hope of the organized physicians to reach ultimately all groups who may want such protection, the association must confine its insurance at the start to relatively safe risks. This will confine the coverage at the start to groups of gainfully employed persons working for reliable concerns. To proceed at once on a more liberalized basis would be to jeopardize the whole experiment.

The first beneficiaries, however, are those of the group most needful for such protection as the plan will give. It is the middle class salary group that is unable to pay the high costs of sickness and yet that disqualifies for most forms of charity aid.

The California Medical Association in taking this step is making a needed and practical contribution to social security but on a nonpolitical basis.—Palo Alto *Times.*

* * *

Insurance Faces Social Legislation

One of the bugaboos of the great American institution of private-enterprise insurance, which has developed far beyond its extent in any other country, is the ever present threat of state operated social insurance. The American institution of insurance has reached its present position as one of the nation's most effective economic stabilizers, through the greatly abused and somewhat frayed "American System of Private Initiative and Enterprise."

Word from Sacramento is to the effect that a state social insurance scheme will be presented at the Legislature this week. This plan, according to available information, will be state operated and controlled, placing in the hands of appointed politicians the health and security of the individual citizen. To pay for this service will be necessary to again tax all employers in California, with a suggestion that this contribution range from 3 to 6 per cent of the pay roll. In other words, the pay rolls of California industry will be boosted by that specific amount without adding a name to the pay roll.

Available Now

Private insurance companies contend that they have service already available; that thousands of employees throughout the United States have this protection individually or through their employer; that in many other instances employees, when given the opportunity, have voted against the plan, although it is entirely voluntary and permits freedom of action in selection of physicians and hospitals.

Since last October the employees of the State of California have been protected under a group health insurance policy, which gives them complete medical, hospital, ambulance, x-ray and other services at a per capita cost of $1.75 per month. They may choose their own doctor and hospital. The service includes the cost of minor or major operations, including hospital and doctor.

Results Gratifying

While admittedly an experiment at this premium rate and by covering the individuals without physical examination, the company involved reports gratifying results and expects that in the first year all of the early problems will be straightened out and that during the second year it will be able, without additional rate, give complete preventive medical service to each state employee.

Reports are also that other large employers have adopted similar programs, the employee and employer both contributing to the cost on a monthly basis. In many of these contracts dependents of the employees are also covered for a more restricted coverage without additional cost . . . which is included in the state employees' contract.

Insurance companies, looking back over 100 years, contend that this voluntary system is better for the morale of the individual and the general welfare of democracy.—San Francisco *Chronicle.*

Mr. Lutgens' Proposals

Harry Lutgens leaves California many good things to show for his four years as State Director of Institutions, the last being some fine suggestions as to how the care of our mentally ill can be improved still further.

Mr. Lutgents, a newspaper publisher, took the position after politicians had done much mischief in the state hospitals and correctional institutions. There was not a report of political meddling during his directorship. He gave the state institutions a sympathetic, businesslike management.

He returns to private life after completing a 13-million-dollar building program. He found in July, 1936, that the institutions were 40 per cent overpopulated; wards were so crowded that patients had to sleep on pads in hallways. The buildings he has started or finished reduce the overcrowding to 17 per cent. At the same time the amount of curative equipment has been increased.

Patients are getting better treatment, thanks to Mr. Lutgens' administration.

Because he has seen to it that the number of doctors and attendants was increased, personnel standards were raised and better working conditions were provided employees all along the line.

Among the unrealized hopes that Mr. Lutgens hands on to his successor and the Legislature are two well-considered proposals.

He says the laws ought to be changed so the insane will be treated as sick people, instead of like criminals. Insanity warrants are served by sheriffs in most counties, and mentally upset persons are held in jail cells, awaiting sanity trial. Mr. Lutgens proposes that the state hospitals send out doctors to examine patients in their own homes and that, with proper hearings and safeguards, patients be taken directly to hospitals rather than to jail.

The second proposal offers far-reaching benefits.

He urges the establishment of mental health centers at both San Francisco and Los Angeles. These centers could do a great work in prevention. Parents could go to them for advice about neurotic children. The general public would be given help on mental hygiene. Research could be carried out. But more important, the two hospitals could serve as points of admission to the hospitals for the insane.

All patients would go first to one of these two centers. Many persons suffering acute upsets might be treated and sent home within a few weeks. Those with chronic ills or disorders requiring longer to overcome would be taken, not from a jail cell or an inadequate detention hospital, but from a good psychiatric hospital to the various state hospitals.

Mr. Lutgens' suggestions and his efficient service are good foundations for the new administration of the institutions.—San Francisco *News.*

"Doc" Indicted

"Organized Medicine Indicted as Trust," says headline. Which gets into a big subject, very big indeed—one that touches not only every doctor but every other son of man who has been afflicted with any ill which flesh is heir, from bellyache to coronary thrombosis.

For some reason or other the headline reminds us of a story, attributable, if our memory serves us right, to the late Lincoln Steffens.

The devil, as the story goes, grew alarmed at a report that sin wasn't doing so well in a certain remote community of his realm. He sent a lieutenant to investigate. The report returned, after careful inspection, was that not a grain of evil could be found.

"Is that community organized?" asked the devil.

"No," replied the emissary.

"Well, that's what's wrong," said the devil. "Organize it!"

This is an age of organization. And organization up to a point is essential in as intricate a civilization as ours. But organization can become too refined—whether it be organized business, organized art, organized labor, or organized professions.

So the real test in this suit against the American Medical Association and its allied units is: Has organization gone to seed—has the economic aspect been exalted under the guise of professional ethics to a point where, as the indictment alleges, the "peace and dignity of the United States of America" are threatened?

* * *

Without seeking to try the case or to restate all the issues set forth by the District of Columbia Grand Jury, we do want to say this about "Doc":

Whether he be on one side or the other in this controversy between the American Medical Association and the group health associations, we think that medicine, of all occupations, is least motivated by the acquisitive impulse. We've all needed Doc. We all have been willing to give our shirt and the fillings from our teeth if he would only come right now, and then we all have kicked about his bill if it was more than $2.00, after we got well.

The very nature of his work—the strange ambition which makes one human being want to spend seven or eight years learning the anatomy of other human beings in order to keep their microbes on straight—has always been a mystery to us. From the old country doctor to the most modern and steam-saturated specialist, it's a service that can't, by its very nature, be essentially mercenary. Commercially, you could go farther and acquire more, applying the same amount of energy and intelligence, in the shoe business, where the telephone doesn't ring in the middle of the night.

But maybe this inherently noble vocation has, as the Steffens story puts it, become overorganized.

Anyhow, that's the question in this antitrust case.—San Francisco *News*.

* * *

Medicine

One of the most cheering sights we have ever witnessed was the recent spectacle in Sacramento of doctors and farmers rubbing shoulders together in seeking an adequate solution of the problem of adequate medical care for rural communities. That's real progress, it seems to us. Give credit for this accomplishment to the forward-looking and progressive Farm Bureau leaders, and to the equally forward-looking and progressive medical men of the state and nation. A fight may accomplish a lot but a real conference will accomplish more. It looks now as if the dreams of Farm Bureau leaders, men and women, for solving the health problems of rural communities and their residents, are coming true at last.—Stockton *Farm Monthly*.

Patterson Sees Action on State Insurance Plan

Sacramento, December 20 (UP).—Lieutenant Governor-elect Ellis E. Patterson, commenting on action taken in Los Angeles by the California Medical Association to inaugurate a health insurance plan, today predicted that similar legislation will be introduced at the coming session of the Legislature.

Patterson, while declining to forecast what action Governor-elect Culbert Olson will take on the proposition, said he hoped that the care of unemployables and indigents will be taken into consideration.

He said it was also to be desired that any such plan of insurance, public or private, permit eligibles to have a maximum salary of $4,000 a year, rather than $2,500, which has been suggested. Patterson said the lower figure, for example, would even prevent the lieutenant governor from obtaining health insurance at reasonable rates since he is paid $4,000 yearly.—Berkeley *Gazette*.

* * *

Advance in Medical Care

Much has been heard of the need for socialized medicine in recent months and years. To meet the requirements of Californians in the low-income group the California Medical Association, by an overwhelming vote, has adopted a plan of health insurance embracing professional and hospital care at low costs. It will be on a voluntary basis.

The plan approved by the convention delegates at Los Angeles is a radical advance, but it was inevitable that it should come. Medical men throughout the country have been seeking ways to make doctor and hospital services available to persons of limited means. The California plan represents six years of study by a special committee. While the program as finally adopted is of pioneering nature, others are coming elsewhere in the country. Utah medicos have just approved a similar plan of coöperative health insurance. New York, Wisconsin and other states are working toward the same end.

The California plan, for the benefit of persons with incomes not exceeding $2,500 a year, calls for monthly premiums expected to be set at approximately $2.50. The larger the response to this voluntary program the more favorable will be the prospect for low premiums.

The plan is expected to be in operation within a few months. The next task—to "sell" the program to the public—should meet a favorable response without requiring hivh-powered salesmanship. A subscriber has the right to choose his own physician and hospital. The program assures, at small monthly cost, freedom from worries over meeting the high cost of medical care which may set back a family for months or years. The plan favors medical attention in time to prevent serious physical developments.

Although the plan has been highly controversial, meeting opposition within the medical profession, it does offer advantages to the doctors. They know they will get some remuneration for their services rather than having uncollectible fees in their books. Programs such as that adopted in California—and to be followed in other states—were inevitable to meet changing conditions and to preclude governmental entry in the socialized medicine field.—Stockton *Record*.

* * *

Medical Care Plan

California, which has traditionally led the nation in many progressive measures, such as the initiative, referendum, recall—to mention only a few—again leads with what may be the beginning of a new health era.

Seven thousand California medical men, through their representatives in convention, overwhelmingly adopted a program of state-wide health insurance.

In an editorial at the time the subject of "state medicine" was being discussed here before the American Medical Association, this newspaper pointed out that the wise measure would be a voluntary step in the direction of care for those in the lower income brackets, rather than wait for national or state legislation.

* * *

And that's why this step of the California medical men is so important; because it was voluntary and a real effort by the doctors themselves to solve the problem.

This problem, simply stated, is merely to insure at low cost for those who have incomes under $2,500 a year (or some comparable figure) an ability to have medical and hospital aid.

Much illness, and much final desperate surgery, can be avoided and the ailment successfully treated easily and rapidly and inexpensively if treated in formative stages.

But in the lower-income brackets, persons themselves ill or having ill dependents, often "let it go" in the hope of saving expense—whereas, in fact, the expense may eventually be much greater, often greater than can be borne, in cases where the ailment is not immediately attended to.

* * *

By the physicians' new plan, for a very small sum, indeed, such persons would have a guarantee of the best treatment possible by the doctor of their own choice, as well as hospitalization.

The plan has been worked out carefully but there are yet details to be polished.

That the plan may work is everyone's ardent wish, both from the point of view of the patient and the physician, as well.—San Francisco *Call-Bulletin*.

* * *

State-Wide Medical Insurance on Way

San Francisco, January 14 (AP).—A preliminary organization to set up a state-wide medical and hospital insurance system was formed here today by the California Medical Association.

The Association's council decided to call the undertaking "The California Physicians' Service." It voted to lend the organization $15,000 for preliminary and organizational work.

It designated seven physicians as trustees. The trustees will be in actual charge of the service. They are Dr. Ray Lyman Wilbur, president of Stanford University; Dr. Lowell S. Goin and Dr. Samuel Ayres of Los Angeles; Dr. C. Kelly Canelo of San Jose; Dr. W. Earl Mitchell of Oakland and Dr. Alson R. Kilgore and Dr. T. H. Kelly of San Francisco.

The Association also enlarged the administrative membership of the service to include Doctors Wilbur, Canelo, Mitchell, Kilgore and Ayres, and Dr. Dewey R. Powell of Stockton, Dr. John C. Ruddock of Los Angeles, Dr. Fred B. Clarke of Long Beach, Dr. S. J. McClendon of San Diego, and Dr. John W. Green of Vallejo.

The administrative membership also was expanded to include an undisclosed number of nonmedical members. This membership will act as an advisory and policy-making body for the service.—Los Angeles *Examiner*.

* * *

Health Insurance

Editor, *The Californian*, Bakersfield:

As an average citizen, I am pleased that the local medical society is backing its state organization's plan for health insurance. My income is limited and a long illness would certainly soon exhaust my meager savings. If I can purchase medical and hospital care on a periodic payment basis, I shall be among the first to sign up for it. I am a taxpayer, but I have no desire to use county facilities. In the first place, I want to be able to choose my own physician and nursing care. In the second place, I like to be responsible for myself and not use tax money for my health care. I pay taxes, but I do not want to think that my personal health bill should be added to a public tax bill while I earn an average income. There must be others like myself who will be glad to pay an annual fee for health care.

The plan presented by the Kern Medical Society is a just one, for it entitles me to the best service of the best physicians and surgeons and the best of private institutions. I am willing to pay for that within my means. I am glad that the doctors have taken the lead in providing such a plan and that they recognize the problems of the small income groups. CITIZEN.

Bakersfield, January 10, 1939.

Doctor Bruck on Board

Two Municipal Health Advisory Appointments Announced

Two appointments to the Municipal Health Advisory Board were announced at City Hall today.

Dr. Edwin L. Bruck, president of the County Medical Society, was named to succeed Dr. William C. Voorsanger, past president, and Lawrence Arnstein was reappointed. The appointments are for four years.—San Francisco *News*, January 6, 1939.

* * *

University Aides to Supervise Los Angeles County Hospital

Answering grand jury suggestions for proposed changes in General Hospital supervision with quick action, the county board of supervisors today called a meeting to approve a plan by which supervision over work in the fourteen medical and surgical divisions of the hospital will be vested largely in medical representatives of University of Southern California and the Seventh Day Adventist Medical School at Loma Linda.

Four hundred and seventy-five attending physicians now on the General Hospital staff will remain so, continuing to do volunteer work as now, it was explained. But at all times there will be on duty in each of the fourteen hospital divisions a supervisor provided by the medical schools. Phoebus Berman will remain medical superintendent of the hospital.

The grand jury, in its report on hospital practices, based many of its proposals on a survey of methods in the San Francisco and Oakland general hospitals. It was announced that the supervisory system to be inaugurated here will follow the method in vogue in San Francisco and Oakland.

In the meeting were to be heard W. W. Nuzum, chairman of the Grand Jury charities and health committee; Eugene Berger, Grand Jury auditor; Dr. Paul McKibben, dean of the medical school at University of Southern California, and Dr. Percy Magan, head of the Seventh Day Adventist institution at Loma Linda.

The Grand Jury was driving to finish its work so that it can be dismissed and the way cleared for selection of a new jury by the end of this week. Although the 1938 jury was ending its duties, there promised to be but little delay in the probe of alleged corruption in Los Angeles city, a major task of the retiring jury during the past month.—Los Angeles *Evening Herald and Express*, January 9, 1939.

* * *

Committee to Improve Los Angeles County Hospital Named

To put in effect recommendations of the County Grand Jury for the reorganization of the Los Angeles County General Hospital, the Board of Supervisors today set up a committee of ten members.

The reorganization program calls for the appointment of twelve supervisors and two directors to be named and paid by the University of Southern California School of Medicine and the College of Medical Evangelists.

These two medical schools will administer and supervise the work of 479 attending physicians.

The change was recommended by the Grand Jury to improve service at the hospital and to reduce the number of days which patients spend there.

It is expected that the new set-up will render greater efficiency and thus make it possible for patients to leave the institution earlier than the present average fourteen-day stay for each patient.

The new committee, named on motion of Supervisor Gordon L. McDonough, includes Dr. Paul McKibben, dean of the School of Medicine, University of Southern California; Dr. Percy Magan, dean of the College of Medical Evangelists; Rex Thomson, superintendent of county charities; Everett Gray, General Hospital superintendent; John H. O'Connor, county counsel; Art Will, Olive View Sanatorium; William Harriman, superintendent of Rancho Los Amigos; Eugene Berger, Grand Jury auditor; Dr. F. M. Pottenger, sanitarium proprietor, and Supervisors Roger Jessup, Oscar Hague and Gordon L. McDonough.—Los Angeles *Evening Herald and Express*, January 17, 1939.

* * *

Fixed Medical Charge Sought

San Francisco, December 29.—A move to bring all physicians, surgeons, dentists, undertakers and hospitals and all their allied services under the control of a state commission which would fix fees and supervise the public administration of medical science was launched yesterday by Avery C. Moore of Berkeley.

Moore, who formerly was associated with the Townsend pension plan, asked the attorney-general's office to give title to a petition which would put the plan on the ballot as a proposed constitutional amendment at the next general election.

The measure would make all doctors, dentists, nurses and other members of the health professions subject to employment in state service.

There would be two classes of such professionals—regular and associate. Regular professionals would receive $2,000 to $7,500 a year salary and devote themselves exclusively to the various types of public health work.

All professionals would be required to become associates in order to qualify even as private practitioners, and would receive fees as fixed by the commission for the performance of professional duties assigned to them by the state. Associates would be permitted private practice also.

The commission, which would be composed of nine commissioners on annual salaries of $5,000 each, would have authority to provide hospitalization and treatment for the entire population of the state "whenever the need becomes evident."

Regular professionals would enter the state service on a voluntary basis but all would owe primary professional responsibility to the state.

Associates would be required to take an oath they would respond promptly to all calls for service on the commission's order.

Hospitals, other than federal and fraternal, would be subject to prosecution on a misdemeanor charge and would expose themselves to the possibility of being closed if they refused to admit and treat any patient in an emergency or if they rejected a commission order for treatment of a patient.—Porterville *Recorder*, December 29, 1938.

* * *

Medicos Against Moore Proposal

San Francisco, December 29 (UP).—Vigorous opposition to a proposed constitutional amendment providing for state-supported hospital and surgical care developed today from physicians now working out a new plan of "socialized medicine" under the aegus of the California Medical Association.

Dr. C. B. Pinkham, secretary of the State Medical Board, joined with other state officers in announcing organized medicine would fight the measure as "impractical" in case it goes the ballot.

The Medical Association's own proposal for a plan of health insurance has been approved and is expected to be put into operation some time after the first of the year when articles of incorporation have been obtained.

The Association's plan provides unlimited medical and limited hospital service to all subscribers, who may choose their own doctor and hospital. It will be limited to those with incomes of $2,500 a year, or possibly may be raised to include those with incomes somewhat above $3,000 a year.—Porterville *Recorder*, December 29, 1938.

* * *

Public Medical Plan Gets Title

Ballot Proposal Backed by Former Pension Promoter

San Francisco, January 28 (AP) — The ballot title of "Public Medical Service" was authorized by the Attorney-General's office today as sponsors of a proposed state health bill prepared to offer a petition to 8 per cent of voters casting ballots for Governor in the last general election

The 8 per cent is essential to procure the proposed bill a place on the next ballot.

The title was sought by Avery C. Moore of Berkeley, former leader in the Townsend pension movement.

Aims of Bill

The bill would provide for the establishment of a nine-man public health commission, and for the founding and maintaining of hospitals.

It also would subject to public service employment by the commission all physicians, surgeons, pharmacists, dentists, optometrists, osteopaths, chiropractors, embalmers, funeral directors, and trained nurses.

All hospitals except federal and fraternal also would be subject to the commission in so far as making facilities available is concerned.

Two Divisions

There would be two classifications:

1. Voluntary enrollment for state service by which enrollees would devote full time and receive an annual compensation.

2. Requested participation for specific work for which a specific fee would be paid.—Los Angeles *Times*, January 30.

The Doctors' Future*

Boys and girls interested in studying medicine these days meet discouraging rebuffs.

"There's no future in the profession," they are told, while the bugaboo of socialized medicine is raised when talk veers around to the topic. The doctors themselves are about as encouraging to youth as a rainstorm to a picnic.

Yet a certain number of students continue to be interested, praise be, and it seems a pity that the money question must always stick up its ugly head when they are choosing a profession.

We are afflicted with disreputable doctors, as everybody knows, and the country seems to be safe for quackery. Yet in spite of this, everybody knows, too, that we couldn't get along without the good ones and that we respect and love them, although we aren't always prompt with our payments.

I am convinced through friendship with a few that the good ones are successful men, whether they make much money or not. Their lives are enriched with gratitude. Mercy is their guardian angel and they know the true happiness that abides with people who love their work better than the cash it brings them.

There will always be a need for excellent surgeons and diagnosticians and even for the plain, kindly, less brilliant men who, besides healing the sick bodies of their patients, give their hearts and souls ease and comfort.

The young people must often believe that adults are too pessimistic. They are justified in such a belief because our croakings are continuous.

"You can't make a living at this; you'll go bankrupt at that; the other field is overcrowded"—so the wailing goes, its implications being, of course, that there's no quick money to be made any more.

No wonder the youngsters so seldom listen to or believe in us. They sense, if they do not know, that there is now and ever will be a crying need for lawyers who are more interested in justice than in fees; for doctors who want to cure the sick instead of making a reputation for doing so, for engineers who will not sell out to grafters, and for politicians who put the state's welfare above their personal ambition.—San Francisco *News*, January 6, 1939.

Health Program Here Aids Two Thousand Farm Migrants

Care Is Given Workers Who Are Ineligible for State, County Funds

More than two thousand migrant agricultural workers in Fresno County have received medical care and surgical treatment since May 2 under a program launched by the Farm Security Administration to care for the health of the agricultural population who otherwise would have been ineligible to receive aid in time of sickness.

H. E. Stevenson, executive officer of the Agricultural Workers Health and Medical Association, said this number is included in a total of approximately 15,000 patients treated at the eighteen offices of the Association in California and Arizona. He said the total amount expended since the inception of the service in May has been $400,000 for the two states.

1,400 Get Surgical Care

"Medical aid has been provided in nearly 1,400 cases which required surgical care," Stevenson pointed out, "and includes over 400 appendectomies and tonsillectomies which have received all the attention required, including surgery, hospitalization, diet and doctors' fees.

"The Association has cared for over 500 maternity cases, and has been responsible for discovering possible epidemics of scarlet fever and malaria and stopping them before they could start. One camp at Indio was threatened with a scarlet fever epidemic, but serum and doctors to administer it were rushed there and the cases were confined to three children.

Prompt Treatment Given

"Malaria at Tulare also threatened for a time, but prompt medical care stopped that."

Stevenson said there have been but four deaths of migrants who have come in for medical attention. He said prompt action on the part of the more than 1,000 doctors who handle the cases in the two states has been responsible for the low death rate.

He said 90 per cent of all money spent by the Association has gone for medical aid, the rest for administration expenses. Some of the aid provided also includes glasses, where needed; specialists for undernourished children, besides the other treatment given. He said a dental program will be instituted within the next few weeks to care for that phase of the migrants' health.

Set Up in May

The Association was set up in May by the Farm Security Administration to care for California's and Arizona's growing migrant population who have left their homes in the drought states of the Middle West and who did not become eligible for aid under state and county health programs until they had satisfied residence requirements.

The California offices of the Association are located at Fresno, the main office; Merced, Stockton, Visalia, Marysville, Indio, Brawley, San Jose, Bakersfield, Arvin and Shafter. The Arizona offices are at Phoenix, Buckeye, Tollison, Chandler, Yuma and Coolidge.—Fresno *Bee and Republican,* December 31, 1938.

* * *

Treatment of the Insane

This newspaper has several times pointed out the need of changes in the system of handling commitments to state mental institutions. Official recognition of this need was given yesterday by Harry Lutgens, state director of institutions, at a meeting of Governor Merriam's cabinet, when he expressed views similar to those voiced by *The News.*

Under the present system, these sick persons are treated as criminals, being placed in the custody of the sheriff until a sanity hearing can be held. Most counties—like our own —have no special facilities for handling psychopathic cases, and the results are usually deplorable, from the standpoint of the patient and all others concerned.

It is time, true, a period must in some cases elapse between the time a patient is brought in and the time his hearing is held before a superior judge and his commitment papers signed. A patient, no matter how obviously insane, cannot be taken directly to the hospital, but must have his "day in court" when he is examined by competent physicians under the eye of a judge. However, during this interim the patient, who is frequently not at all violent, should not be kept in jail. Establishment of a local psychopathic ward, possibly at the County Hospital, would not only afford a place in which to keep persons awaiting a hearing, but could be used for the treatment of cases not demanding a stay at Agnew.

In medieval times it was sometimes believed that insane persons were possessed by evil spirits and were therefore deserving of some sort of punishment. Now we know that the insane are ill and in need of treatment, the same as any other sick person. They should receive not only a kindly and competent examination in court by physicians and a judge who know what they are doing, but are entitled to "decent" treatment in advance of that hearing.—Editorial, San Jose *News*, December 29, 1938.

* * *

California Medical Case Is Carried to Supreme Court *

Pacific Health Corporation Seeks to Set Aside Lower Body's Ruling

A group medical practice case from California has preceded the antitrust case against organized medicine in appealing to the Supreme Court of the United States.

From San Francisco, a petition for a writ of certiorari has been filed to bring before the Supreme Court an appeal by the Pacific Health Corporation from a California Supreme Court decision that it had practiced medicine without a license.

The California case is quite different in its essentials from the fight here centering around Group Health Association, although both organizations provide medical care to groups of persons paying on the installment plan in advance.

The Supreme Court will take under advisement the petition for a writ, and decide later whether to review the California case.

Furnishes Treatment

The Western unit contracts to furnish medical treatment, when needed, in return for a regular paid-in-advance fee. It employs outside licensed physicians to give the treatment, but the California courts held that the corporation itself was practicing medicine without a license and in violation of the law.

In Washington, Group Health Association employs its own physicians, who are licensed to practice medicine, and operates a clinic, but, unlike the Pacific group, Group Health Association has already been held legal by a federal district court, here, and not a violation of law, either the district medical practice act nor the insurance act. Further litigation on these points, however, is pending here.

Group Health Association Center of Case

Group Health Association is the center of the antitrust case against organized medicine, in which indictments have just been return by a federal grand jury here charging four units of organized medicine and twenty-one leading doctors with conspiracy in restraint of trade for violation of the Sherman Antitrust Act. This case is expected to reach the Supreme Court of the United States.

---

* By Mrs. Walter Ferguson.

* For full opinion of Supreme Court of California, see CALIFORNIA AND WESTERN MEDICINE, October, 1938, on page 306.

In California the State Supreme Court had held that employment of physicians by the Pacific Health Corporation to treat members of the Public Health Corporation was a violation of the state medical laws.

In asking the high tribunal to void the decision by the state court, the corporation did not question the validity of the state law in so far as it prohibited any unqualified or unlicensed physician from practicing medicine, but said:

"In so far as the statute, as construed by the highest court of the state, prohibits the petitioner from undertaking to pay for services of licensed physicians, . . . it plainly forbids the exercise of an ordinary property right and denies what the Constitution guarantees under the due process clause of the 14th Amendment.

"The mere circumstance that doctors are selected and paid for by the organizations has no more reasonable relation to the public health than the mere ownership of a drug store by one not a pharmacist."

Court Divided 4 to 3

The California Supreme Court split, 4 to 3, on its decision.

The Pacific Health Corporation referred in its petition to statements by the Justice Department regarding the American Medical Association and added:

"This case is of substantial import, for it is the test case chosen by the organized medical practitioners of the country to terminate, prevent and strike down what they generally term group medicine.

"The real and manifest purpose of the proceeding instituted in the state court was to secure and establish a declaration of law which would rule out all medical service organizations, including the petitioner, whose primary business it is to furnish medical care to the working and poorer classes.

"Neither the petitioner nor any of these other medical service corporations can, under the prohibition of the California statute, continue to render the necessary and beneficial service which they have been rendering to the poor and small-salaried class unless and until the statute is nullified by this court."—Washington, D. C., *Star*, December 22, 1938.

* * *

Health Insurance Progressive Move

Beset by the fear of socialized medicine under governmental administration, the California Medical Association has adoptede a plan of health insurance to be offered to the people of the state. It is yet too early to say whether the plan adopted is the ideal plan or whether it will be adapted to the needs of the people at large.

However, this much may be said: It is a step in the right direction. It is a tardy recognition by the medical profession, even if under pressure, of the crying need of the American public today, the need of greater security against the costs of sickness. The matter of health and accident have long been the most uncertain factors in modern life. Many a family which has been doing nicely while health was with it has been thrown upon the financial rocks through the misfortune of illness or injury. Many parents have suffered agonies of mental anguish through financial inability to provide for the needs of a suffering loved one. Many homes and lives have been wrecked through a failure to be able to meet the trials and costs of long illnesses.

The movement for medical insurance is in the right direction. It may have to be remodeled, expanded or changed, but at least it is a step towards the provision of more adequate medical services to all the people. Having started this move, the doctors should bend every effort to see that it is a success and that if in the suggested form it does meet the needs of the people changes should be made to fit those needs. Only in this way can the medical profession fulfill its obligation to the public and only in this way can it reëstablish the esteem in which it should be held in the public eye.—Editorial, Yuba City *Independent Farmer*, December 23, 1938.

* * *

Editorially Speaking

"The medical profession in California today pioneered a new field of medicine when the State Medical Association adopted a low-cost health insurance program." . . . News item.

* * *

Health insurance for the general public is a proposition that has been attracting increasing attention during recent years as the nation has developed a more acute consciousness of social problems in their general aspects.

For many years, of course, various types of health insurance and group medical facilities have been in force in many parts of the country. But most of these have been operated under private management, exclusive of the medical profession. Medical men, it seems, have hesitated to enter the field on a general scale because of certain aspects associated with the profession's code of ethics and with practices that have prevailed for centuries. The hesitancy has been prompted, to a large extent, by the fear of "socialized medicine."

But the past year has witnessed a marked change in the situation. Instead of remaining aloof, the medical profession has taken a keen interest in the matter and has centered its attention on the problem, working with other agencies toward some sort of solution that will provide better medical care for those of moderate means.

Symbolic of the new attitude is the program recently adopted by the California State Medical Association, which is to be placed in operation within the next three months. Under the plan, subscribers will be provided with unlimited medical and limited hospital service, choosing their own doctor and hospital. Chiefly it is designated to serve wage earners with annual incomes of not to exceed $2,500, which embraces the great mass of citizens.

How the plan will work is something upon which nobody can hazard a guess, since there is no precedent upon which to base a prediction. But doubtless it will appeal to a vast number of people. In any event, the state's medical profession certainly has evidenced its sincerity of purpose in the performance of its basic job—to keep the public well.—Editorial, Eureka *Standard*, December 22, 1938.

* * *

Los Angeles Mayor's Health Plan Approved

Council Favors City's Contracting for Certain Services

The City Council yesterday indicated its agreement with the plan of Mayor Bowron to clear away legal obstacles so that the city may contract with the county, or the state, to furnish certain health services.

Repeal Favored

Specifically, Mayor Bowron asked sponsorship of legislation at Sacramento repealing a provision of the Political Code which prohibits Los Angeles city alone among municipal corporations from making such a contract. His message was referred to the Legislative Committee, whose chairman, John W. Baumgartner, indicated the plan will be carried out.

In his message Mayor Bowron went beyond a contract with the county, suggesting that the state might well look after tuberculous patients, milk and meat inspection and rodent control. He made it clear, however, that he is not committed to any such plan, but recommended that definite action await a thorough study.

Shift Sought

He said that "many powerful, selfish and sinister influences are at work," now that a change in the Health Commission has been effected, to shift inspection and regulation to other hands. He declared his full belief that the new commission will be capable of making a thorough investigation of all elements involved.

Councilman James M. Hyde, after the message was read, said certain cities in the county receive free health service from the county, and suggested that this matter be looked into, with the purpose of safeguarding the interests of Los Angeles.—Los Angeles *Times*.

* * *

Bill Calls for Premarital Tests for Venereal Disease

A bill to provide for the premarital examination of prospective brides and bridegrooms for syphilis was introduced in the Senate yesterday by Senators Edward Fletcher, San Diego, and Robert W. Kenny, Los Angeles.

Similar legislation is planned on the Assembly side. Assemblyman S. L. Heisinger, Fresno, has announced he will introduce such a measure in the Assembly and Hugh M. Burns, Fresno, anounced recently he intends to introduce a new section requiring prenatal examination of all mothers.

Certificate Needed

Fletcher said his measure would require all prospective brides and grooms to obtain a certificate showing them to be free of syphilis before the county clerk can issue a marriage license. He said restrictions on gonorrhea are not included in the bill submitted.

Senator George M. Biggar, Covello, revealed further legislation is being considered to prevent couples from evading the purpose of the act by going to a neighboring state to marry. He said the details as to how this part of the act would work have not been completed.

Any Test Acceptable

The bill already introduced makes it possible for couples to obtain certificates from any physician whom they may choose and does not limit the test to a Wassermann blood test. He said any recognized test is acceptable under provisions of the act.

The bill was referred to the Judiciary Committee for consideration.—Sacramento *Bee*, January 4, 1939.

West Virginia Requires Citizenship

The West Virginia Public Health Council recently adopted a resolution limiting the license to practice medicine and surgery in the state to native-born citizens and those who have acquired full citizenship. Each native-born citizen is to submit a birth certificate, and each foreign-born applicant a photostatic copy of his naturalization papers. At the same meeting the council adopted a resolution declaring that graduates of unclassified medical schools will not henceforth be considered for licensure either by examination or by reciprocity.—*Diplomate,* December, 1938.

* * *

Every Sixteenth Employed Person Has Government Job

One of every sixteen employed persons in the United States has a government job, according to a recent survey by the National Industrial Conference Board.

And that's not counting the army of emergency employees of the WPA and the CCC.

The Board's report shows a total of 2,590,000 men and women on regular government payrolls—federal, state and local—a new high record.

The number of government job holders has increased tremendously during the past ten years, despite great fluctuations in business and general employment.

In 1929, when general employment reached its highest level, regular government employees numbered 2,070,000. Now, although there are 4,930,000 fewer persons at work in industry, government employees total 2,590,000—a gain of 25.1 per cent. Between September, 1937, and June, 1938, about 79,000 men and women were added to regular government payrolls, while 3,340,000 had to be dropped from other payrolls.

Hospital Interest Charges Opposed

Supervisor Asks Ban on Fee System

Chairman Roger Jessup of the Board of Supervisors will demand that the County Charities Department discontinue its policy of charging 7 per cent interest on bills due for treatment at the General Hospital, the supervisor revealed last night.

"I have learned," said Mr. Jessup, "that one former patient of the General Hospital is being dunned for $59 for interest on an account due for treatment which he has been unable to pay.

"I am opposed to this. The county should not be grasping or usurious in its handling of those unfortunates who have had to resort to this institution for treatment."—Pasadena *Star-News,* December 28.

* * *

Dog Quarantine May Be Lifted

County Health Officer J. L. Pomeroy today announced he would ask that the state quarantine on dogs be rescinded.

Doctor Pomeroy's announcement followed passage by the Los Angeles County Board of Supervisors of the dog leashing ordinance which prohibits dogs from running at large except on premises of their owners. They will be required to be on a leash not more than 10 feet in length. Dogs in Altadena are affected by both the state and county regulations.

The state quarantine on dogs has been in effect almost a year and followed an epidemic of rabies now said to be under control.

It is expected that the state will accede to Doctor Pomeroy's request. This will again grant to farmers and ranchers the protection of dogs. Recently a petition from Puente Valley farmers asked modification of the quarantine so that their dogs might be left to roam as a protection for crops.

The dog leashing ordinance will not affect ranch areas but will be applicable only in more congested areas. Terms of the ordinance raise license fees for unspayed female dogs from $2 to $4, leaving other license fees as is.—Pasadena *Star-News,* December 28.

Three-Point Plan Offered for Mental Patients' Care

California must detect and attempt to cure the ills of its mental defectives in the acute rather than the chronic stages if it is to cope with the growing load of such cases, Dr. Aaron J. Rosanoff, new state director of institutions, told 600 persons at a testimonial dinner in his honor last night.

In the Hollywood Roosevelt Hotel, whose supper room was jammed to capacity with well-wishers gathered from the Siskiyous to San Diego, Doctor Rosanoff outlined his plan to ease the load on California's overcrowded and inadequate institutions for the mentally ill.

Plans Outlined

The plan has three phases, the new director explained. They are:

First, to stretch an available $4,500,000 for buildings to house patients from a proposed 3,000 beds to 4,000 beds without abandoning Class A construction.

Second, to establish a 200-bed acute neuropsychiatric unit in connection with the University of California Hospital and Medical School in San Francisco; also, later, a similar one in Los Angeles.

"With the aid of its out-patient department, such a unit would greatly facilitate the recognition of mental disorders in their incipiency and the application of appropriate treatment at a time when it often would be effective," Doctor Rosanoff said.

Extension of Care

"The final feature of my plan calls for a large-scale extension of extramural care of mental patients. At the present time about twenty-eight hundred of our state hospital patients are out on parole. These consist mostly of patients who have recovered or improved sufficiently to return to their homes and to their work."

The only way, the speaker said, that this can be accomplished is "by greatly increasing our social service personnel."

The present staff of sixteen workers would be increased to fifty-six during the new biennium, at a cost of $160,000. This, Doctor Rosanoff said, would result in a net saving of $940,000 in maintenance cost of patients during the biennium.

Doctor Rosanoff said he was assured of support from the new state administration, the personnel of his department and the interested professional groups throughout the state.

Doctor Rosanoff praised Harry Lutgens, his predecessor, for efforts during the last four years to cope with the growing mental case load. He said that the patient load increased from 18,812 four years ago to current 22,037, while the hospital capacity was growing from 14,222 to 17,555, leaving an excess hospital population of 4,482 patients.

With Dr. Lewis Browne, author and lecturer, as toastmaster, the following were introduced and spoke briefly:

Superior Judges Ben B. Lindsey and Robert H. Scott, Dorothy Wisnor Smith, head of the Travelers Aid Society; Mayor Bowron, Rabbi Edgar F. Magnin and Rt. Rev. Msgr. Thomas J. O'Dwyer.—Los Angeles *Times.*

Health Plans Views Clash *

Insurance Proposals Debated by Leaders in Medical Field

Chicago, January 25 (AP).—Conflicting views on the social aspects of medical care were voiced tonight by two leaders in the field of medicine.

Dr. Morris Fishbein, editor of the *Journal of the American Medical Association,* declared:

"America cannot exist with its medical profession enslaved to make a politicians' holiday."

Need of Middle Class

Dr. John P. Peters of Yale University—secretary of the Committee of Physicians for the Improvement of Medical Care, a group which once accused the American Medical Association of "standpatism"—asserted:

"Some method must be devised by which the great mass of our middle class population may secure the medical attention they require without being subjected to indignity."

Their addresses were delivered before the Chicago Hospital Council two days after interdepartmental committee's report—proposing compulsory health insurance among other things—was sent to Congress by President Roosevelt for careful study.

Decries Compulsion

"Compulsory sickness insurance," said Doctor Fishbein, "must inevitably result in a deterioration of the quality of medical service, and prove a step toward a fascist or communistic system."

"Compulsory insurance is damned on the basis of European experience without mention of the fact that in almost every instance it was adopted only after bitter experience with voluntary insurance," said Doctor Peters. "I admit that immediate nation-wide imposition of compulsory insurance would probably be unwise. But I have no faith at all that voluntary insurance would solve our problems."

Fears Deterioration

"We have made progress by retaining individual initiative," Doctor Fishbein maintained. "If that initiative is destroyed, progress wll cease and the dry rot and deterioration inevitably associated with job holding under political domination will set in."

"To suggest that those who receive salaries work less efficiently than those who receive fees for service is to slander 80 per cent or more of our population," said Doctor Peters. "It is a travesty upon the ideals of medicine to insist that the ceremony of direct transfer of cash from patient to physician preserves the sanctity of personal relations."

---

* See also item on page 166.

Active Fight

He said organized medicine "actively combats attempts of physicians and laymen to experiment along new lines for the organization of medical services on a coöperative basis."

Doctor Fishbein reported at least three hundred experiments in group medical practice are in operation and that the vast majority of doctors participating in them are members of the American Medical Association. The Association has opposed some group plans, he added, "because in many instances they are commercialization of the practice of medicine from beginning to end."—Los Angeles *Times.*

Migrant Aid Plan Offered

"Help Them Before They Become Burdens on California," Urges Congressman

Special to The News

Washington, January 27.—A demand that the Federal Government aid "marginal people" in their home states to prevent migration to California was made in the House of Representatives this week by Representative Leland M. Ford of Los Angeles.

Representative Ford also proposed that the Government disseminate information at the sources of the migration that there will be no relief available to nonresidents of California, and that the Government encourage and aid the return to their homes of the idle thousands now in California who have neither lost legal residence at home nor achieved it in California.

He urged the Government to "recognize the inequality of having California or other states pay for these people who have come into their respective states from the outside and should transfer the money that is granted for relief to the states to which these people have moved."

He said the Government should equalize the benefits of aid to the aged so as not to make those states which are paying such benefits pay all migrants from those states which are not.

"It is the opinion of people of California that relief money should follow migration," said Representative Ford. "It is my opinion that if the tax load becomes so heavy in this or any other state it becomes uneconomical to carry on any business, to own homes or own property; that there is nothing but failure ahead."—San Francisco *News.*

Old Age Pay Rises for State

Sacramento, January 30 (INS).—Old-age assistance checks were distributed among 125,270 pension-eligible California residents and totaled $4,062,914.67 during December, Mrs. Florence L. Turner, state director of social welfare, announced today. This was an average of $32.43 for each aged recipient, compared with a November state average of $32.41.

County totals and individuals benefited included:

Los Angeles, $1,633,490.15, distributed among 50,646; San Francisco, $300,808.50, among 9,161; Alameda, $237,585.16, among 7,593; Marin, $18,431.32, among 576; San Mateo, $28,544, among 879; Santa Clara, $110,587.43, among 3,431; Sonoma, $63,586.64, among 1,982; Santa Clara County, 101,478 checks, $842,489.73; San Jose, 94,938, $784,434.22; Palo Alto, 6,540, $58,055.41; Vallejo, 7,606 checks, $67,413.87, and Santa Rosa, 8,020, $72,298.07.—San Francisco *Call-Bulletin.*

Politicus Looks Over Sacramento*

Sacramento, January 30.—In case you're interested in legislative statistics, here are a few for you:

In the Assembly, during the twenty-three-day session, there were introduced 2,767 bills, 71 constitutional amendments, 16 concurrent resolutions and 19 joint resolutions—2,873 separate pieces of legislation.

This compared to the all-time high of the lower house in 1937 of 2,785 bills, 44 constitutional amendments, 23 concurrent resolutions and 26 joint resolutions—2,878 separate pieces of legislation.

In the Senate, an all-time high was established with 1,272 pieces of legislation, being 1,227 bills, 23 constitutional amendments, 9 concurrent resolutions and 13 joint resolutions.

All-Time High for Bills

Together, both houses set an all-time high for introduction of legislation with a total of 4,155. In 1937, the entire session saw 4,071 measures introduced.

The 4,155 figure does not represent the session. When the Legislature convenes March 6, each legislator is permitted to introduce two bills, a total of 240. Each is also permitted to introduce as many resolutions as he desires.

One interesting point of the period is that ninety-constitutional amendments were suggested.

If all these were approved by both houses, it would mean a ballot containing at least ninety-four separate propositions in November, 1940, when a new President will be selected for the United States.—San Francisco *Call-Bulletin.*

* * *

Fair Enough*†

Congress Doesn't Know Its Own Power Under Income Tax Law

New York, January 30.—The income tax amendment is short and wide. It just says that Congress shall have power to lay and collect taxes on incomes, from whatever source derived, without apportionment among the several states and without regard to any census or enumeration.

It says nothing about rates of tax or exemptions, nothing about deductions or expenses incurred in the acquirement of the income, nothing about gross or net or any fine distinction between capital and income or the subtraction from the gross of amounts paid as taxes in other ways. It says nothing about immunity for public employess of the states and their subdivisions or for labor unions or religious or charitable organizations. The amendment left all such matters to the conscience and mood of Congress in the future, and it must be admitted that, in some ways, Congress has done quite the handsome thing up to now. The courts also have done their bit.

A city man gets an exemption for himself and wife, if any, children, if any, and other dependent relatives, if any, and a farmer may also charge off the cost of supporting his cow provided she is a professional cow, producing milk, butter and, occasionally, veal, which, being sold, produces income.

* * *

May Deduct Veterinary Costs

He may even deduct the cost of a veterinary to attend his cow in her hour, although the cost of medical care for his wife, in hers, is not deductible. If the horse that pulls his plow comes down of a misery he may charge off medical advice and care and liniment, although if he, himself, comes down of a crick from pushing the plow and needs a doctor and a bottle of No. 97 or No. 38 that expense is not deductible. He may charge off wear and tear on the cow and horse but not wear and tear on himself.

If a man is a professional ballplayer—a Babe Ruth or a Dizzy Dean, for example—he is entitled to the conventional exemptions and deductions pertaining to his line of work but is not allowed to charge depreciation on his equipment, plant or whatever you would call his physique. But the corporation which owns him, as property, may list him—or, rather his contract—in the same general category as the farmer's professional or income-producing cow and show gradual depreciation and schedule as business expense the cost of pulling his teeth or tonsils, feeding him T-bones and hashed brown potatoes and shipping and stabling him on the road.

* * *

Beautiful Exhibition of Restraint

The exceptions, exemptions and immunities provided by Congress in an effort to be nice, although armed with a devastating authority to tax, are, on the whole, a beautiful exhibition of restraint, adorned by many amusing and cheering oddities.

All that the Constitution says about freedom or religion is this: "Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof." It doesn't say that religious organizations must be immune from the theory behind chain store taxation applying to concerns operating interstate. And the income tax amendment doesn't say that Congress must permit those who contribute to religious organizations to deduct such gifts or any proportion of them from their income.

The religious freedom article doesn't even mention the subject of immunity from property taxes for religious organizations, and, of course, labor unions or pools of wealth were unheard of at that time.

* * *

Labor Unions Not Limited

However, under the income tax amendment, Congress still has the power to lay the tax against religious and labor organizations, and for all that any other constitutional provision says to the contrary, Congress may. In fact, in the paragraph of the Revenue Act, providing exemption for religious organizations, Congress bared a fang in 1936 and a phrase was inserted to provide that such organizations could not enjoy the exemption if a "substantial part" of their activities consisted of carrying on propaganda or otherwise attempting to influence legislation.

---

* By Politicus.

* By Westbrook Pegler.

† Of interest, because the California Medical Association, formerly exempt as a nonprofit scientific organization, has recently been placed under a new classification, namely, a "business league," and, as such, liable for taxation.

Labor unions, however, are not placed under any such limitation, and a union under communistic domination may attempt to influence legislation without risk, whereas, nominally, at least, a church invites the wrath of the Internal Revenue for attempting to exert a counter influence.

There is almost no limit to the tricks that a playful Congress could do with the income tax authority, and if the subjects were really smart they wouldn't say a word for fear of riling the statesmen and reminding them of their strength. Under their power they can just say to Hell with cute distinctions and exemptions, and hereafter everybody, including churches, unions and all, must shower down 20 per cent or 50 per cent of all dough or profit acquired in the year, and don't forget what happened to Al Capone.—San Francisco *News,* January 30, 1939.

Chiropractors for Births Case Issue

The question of whether chiropractors may legally act as doctors at childbirth under the California Medical Practice Act was an issue today in Judge Newcomb Condee's court, where a jury was being selected to try David C. Long, 1652 West Forty-seventh Street, for violation of the Act.

He is specifically charged by Deputy City Attorney Everett Leighton of delivering a child for Mrs. Wilton Whitehouse of 1224 West Slauson Avenue. The prosecution contends that chiropractors are not allowed to use instruments, and that obstetrical cases necessarily involve their use.

Defense Attorney Max Gilmore, who has subpoenaed thirty-five physicians and surgeons, contends that under a Chiropractic Act passed in 1922, such doctors are legally empowered to attend maternity cases.

Outcome of the case will affect some four thousand chiropractors in California, it is said.—Los Angeles *Herald and Express,* January 17, 1939.

LETTERS

Subject: Hospitals of the Golden Gate International Exposition.

San Francisco, December 27, 1938.

To the Editor:—I thank you for the clipping telling of the New York World Fair medical department. . . .

The Golden Gate International Exposition will probably have two emergency hospitals, and inasmuch as the longest haul then would be one-third of a mile to either one, the ground would seem to be better covered than the New York Fair with five as they are providing for—or six that Doctor Hoguet mentions. Inasmuch as the crowd at the New York Fair will be more dense, and ambulance transportation correspondingly delayed, I believe we will have better service at the Golden Gate International Exposition. . . .

Sincerely yours,
M. R. Gibbons, M. D.,
Medical Director.

Subject: Endorsement of the "California Physicians' Service."

(copy)

Santa Clara County Medical Society
Medico-Dental Building
San Jose, California,
December 29, 1938.

The Council of the California Medical Association,
450 Sutter Street,
San Francisco, California.

Dear Doctors:

The Santa Clara County Medical Society, by unanimous vote at its regular meeting December 21, 1938, approved and whole-heartedly endorsed the plan for medical and hospital insurance as it was finally accepted by the House of Delegates at the special session held December 17, 1938, in Los Angeles. This action was taken only after mature discussion, and its unanimity is a real measure of the considered opinion of the Society as a whole.

You are informed of this action at the direction of the Society in the belief that an expression of the solidarity of this Society and the very real desire of its members to coöperate may be of interest and value to you.

By order of the Society.

Leslie B. Magoon, M. D.,
Secretary.

Subject: Medical and Osteopathic Practice Acts of California: Report of a Case.

(copy)

420 State Office Building,
Sacramento, California,
December 16, 1938.

Yours of November 26
Re: ————, M. D.

To the American Medical Association,
535 North Dearborn Street,
Chicago, Illinois.

Gentlemen:

Our records show that a letter from the Board of Osteopathic Examiners, dated April 26, 1938, signed ————, D. O., Secretary, reports that "————, D. O., was issued a physicians and surgeons' certificate (20 C. D. 5, dated July 15, 1937) by our Board on the basis of record of military service, documentary evidence of which was presented. He qualified in his application before the Board as a graduate of the Boston Institute of Osteopathy (September 10, 1900), which later became the Massachusetts College of Osteopathy."

Our records show that Doctor ———— graduated from the University of Pennsylvania School of Medicine June 8, 1898; filed California reciprocity application March 4, 1935, based upon a New York license dated September 20, 1912. On March 13, 1935, he passed the oral examination, and on March 21, 1935, was issued California physicians and surgeons' license No. C-5661 by the Board of Medical Examiners.

The above record indicates that Doctor ———— is well supplied with California licenses, *i. e.,* he holds a physicians and surgeons' license issued by the Board of Medical Examiners of this state, as well as a physicians and surgeons' license issued by the Board of Osteopathic Examiners, created under the Initiative Act of 1922. The osteopathic Initiative Act provides that on and after the effective date of said Act, the Board of Medical Examiners shall have no jurisdiction over graduates of osteopathic schools which may be licensed on the effective date of said initiative or may thereafter be licensed.

The case of Doctor ———— involves a delicate legal point. However, it is the opinion of the undersigned that Doctor ———— has, under the provisions of said initiative, automatically forfeited his physicians and surgeons' license issued by the Board of Medical Examiners, such forfeiture being based upon his having applied for and having been granted a physicians and surgeons' certificate based upon osteopathic credentials. At all events, Doctor ————'s California physicians and surgeons' license issued by the Board of Medical Examiners has been automatically forfeited through failure to pay the annual registration fee due January 1, 1938, and delinquent sixty days thereafter.

The Osteopathic Board reports his present address to be ———— Avenue, Glendale, California.

Very truly yours,
C. B. Pinkham, M. D.,
Secretary-Treasurer.

Subject: American Congress on Obstetrics and Gynecology.

An American Congress on Obstetrics and Gynecology was proposed by the Central Association of Obstetricians and Gynecologists to study our present-day problems on obstetrics and gynecology and their solution.

National, sectional, and local societies of obstetrics and gynecology have passed resolutions approving such a congress. Representatives of these societies petitioned the American Committee on Maternal Welfare, Inc., of which Dr. Fred L. Adair is chairman, to sponsor the meeting. This committee accepted the responsibility and decided to hold the meeting in Cleveland, Ohio, September 11-15, 1939. The major committees have been appointed and are now planning the program and the organization. Purposes are:

To present a program of our present-day medical, nursing, and health problems from a scientific, practical, educational, and economic viewpoint so far as they relate to human reproduction and maternal and neonatal care. The program and exhibits will be presented in such a manner that they will be of value not only to the medical profession but to nurses and all persons and agencies concerned with the problems of human reproduction and maternal and neonatal care, as well as to the lay groups.

This is not in any sense a legislative body and will take no action relative to maternal and infant care. Its purpose is, as clearly stated, a congress for the presentation of scientific material mostly of factual type. It is hoped that this will lead to better understanding among professional groups of the problems involved in human reproduction and to a better understanding and coördination of effort among the groups who are participating in the Congress.

MEDICAL JURISPRUDENCE†

San Francisco

Statute of Limitations in Malpractice Actions: Recent California Decision Further Extending Time Within Which Patient May Sue

Some time ago we commented (California and Western Medicine, March, 1937, page 204) upon the decision of the California Supreme Court in *Huysman* vs. *Kirsch*, 6 Cal. (2d) 302, in which it was held that the one-year period within which a malpractice action may be commenced is extended in the case of failure of a surgeon to remove a sponge placed in a surgical wound during surgery until one year after the patient had been informed of the presence of the foreign substance in his or her body.

A very recent decision of the District Court of Appeal, *Trombley* vs. *Kolts*, 95 Cal. App. Dec. 632, apparently further extends the exception to the one-year statute of limitations above noted. In the *Trombley* case the facts were as follows: Plaintiff was operated upon by defendant on February 12, 1932, and during this surgical operation defendant, in some manner not disclosed, allowed a skin clip to drop or fall and become embedded in plaintiff's body. In November, 1932, and on the advice of defendant, plaintiff caused x-ray films to be taken, which disclosed the presence of a foreign body, *viz.*, the skin clip. Upon being informed of the presence of the skin clip, plaintiff returned to defendant, who advised her that the skin clip would have no ill effect or detriment and that she would not thereafter be caused any trouble, injury or ill effect by reason thereof. Plaintiff testified that she believed defendant's advice and did nothing further about the matter until October 12, 1934, at which time she consulted another physician, who advised her that the skin clip, if allowed to remain in her body, would have deleterious effects upon her health. Later, in the month of October, 1934, an operation was performed by a physician other than defendant and the skin clip removed. Plaintiff's action for malpractice was commenced within one year after October 12, 1934, but of course much more than one year after February 12, 1932, the date of the first surgical operation, and much more than one year after plaintiff was *informed* of the presence of the skin clip in her body by the radiologist, who interpreted the x-ray films.

On these facts the defendant physician pleaded the statute of limitations contending that the one-year period in which a patient may commence action for malpractice started to run upon the date that plaintiff became aware of the presence of the skin clip in her body, *viz.*, in the month of November, 1932. The trial court accepted defendant's view of the case and ordered judgment in favor of defendant on the ground that the statute of limitations had run prior to the commencement of the action.

On appeal, the judgment was reversed on the ground that the statute of limitations did not commence to run until September, 1934, that is, less than one year prior to the commencement of the action. September, 1934, was taken as the date of the commencement of the one-year period by the District Court of Appeal because that was the month in which plaintiff discharged defendant as her physician and sought medical advice elsewhere. The theory of the Appellate Court was that plaintiff's cause of action did not accrue even when she was informed of the presence of the skin clip in November, 1932, so long as defendant remained her physician and caused her to believe that nothing injurious would result from the presence of the skin clip in her body.

The following quotation from the opinion of the Court discloses the reasoning upon which the decision is based:

> Upon this state of the record, showing as it does a continuation of the relationship of physician and patient, there was a continuing obligation on the part of respondent physician, and the statute of limitations did not commence to run until the termination of the relationship, which, according to appellant's testimony, occurred in September, 1934. In the instant action, the negligence consisted in leaving the skin clip in the body of appellant after the purpose for which it had been placed there had been fully accomplished, and this negligence continued up to the time of its removal in September, 1934. Where the tort is continuing, the right of action is also continuing. It was the ever-present duty of respondent doctor to remove the skin clip from the body of appellant, and especially was this his duty after he discovered from the x-rays the presence of such foreign object within the body of appellant. The evil consequences which followed the operation in the instant case gave rise to appellant's cause of action, and that cause of action extended during the entire period the surgeon was in charge of the case, and her right of action became complete only when in September, 1934, she terminated the relationship of physician and patient and sought the aid of other surgeons to remove the skin clip. It would be inconsistent to say that the appellant might sue for her injuries while the respondent doctor was still in charge of the case and advising and assuring her not to worry about the skin clip "because it will never cause you any trouble. There are hundreds of people walking around with those things inside of them and it never causes them trouble. And as your physician and surgeon, I advise you against the operation."
>
> . . . The relation of employment in this case, according to appellant's testimony, having continued up to September, 1934, each day's failure to remove the skin clip was a fresh breach of the contract implied by the law. The removal of the skin clip was a part of the operation, and in this respect the surgeon left the operation uncompleted. (See *Akridge* vs. *Noble*, 114 Ga. 949, 41 S. E. 78.) Certainly, the statute of limitations should not run against appellant's rights during the time she was in ignorance of the cause of her disability, and could not with reasonable care and diligence ascertain such cause, and in the instant case, where, as she testified, appellant relied upon respondent's assurances that the presence of the skin clip would not impair her health, the statute should be tolled during all the time she was under the care of respondent and consulted only with him with reference to the condition produced by the presence of the skin clip in her body.

It is to be noted that the physician-patient relationship remained between plaintiff and defendant even after discovery of the foreign substance in plaintiff's body and that the physician defendant induced plaintiff not to do anything about it by asserting that nothing was wrong. It may safely be assumed that the Court would have held the statute of limitations to have run and the action barred if the defendant physician, upon the discovery of the skin clip, had *not* undertaken to give further advice to the plaintiff but had recommended the employment of a consultant and the submission of the matter for decision to the consultant chosen. A resort to independent advice and the furnishing of that independent advice to the plaintiff-patient, would probably have accrued the plaintiff's cause of action and started the one-year period within which action for malpractice could be commenced.

---

† Editor's Note.—This department of California and Western Medicine, presenting copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

CLASS AND MASS ISSUE IN SOCIAL MEDICINE SEEN*

It is the history and tradition of the medical profession—recognized by President Roosevelt in his message to the National Health Conference at its meeting in Washington—that it stands ready at all times to give of its utmost in raising the standards of medical education and the quality of medical service, and in extending the benefits of its knowledge to all who require them.

Need I repeat the now well-recognized fact that each day the physicians of this country contribute more than $1,000,000 in medical services to the people, a staggering total of $365,000,000 a year in voluntarily contributed service?

LOCAL INADEQUACIES

Nevertheless, our own studies of medical care have revealed certain local inadequacies and certain inequalities in the distribution of medical care, and we welcome the concern shown in the endeavor to solve these problems.

In discussions of this subject published during the last few years, the medical profession constantly has maintained the importance of sustaining the quality of medical care. It also has emphasized certain principles which the House of Delegates of the American Medical Association has established as fundamental to good medical service to all the people.

There can be no acceptance by the medical profession of any system of medical care which is based on the idea that the well-to-do shall receive one quality of medical care while the farmer, the laborer, and the white-collar worker are to be placated with a wider distribution of an inferior medical service.

Since experimentation is the very basis of medical progress, the physician is likely to wish for a controlled experiment suitably confirmed before he will accept either the safety or usefulness of any measure or method.

History will show that the great progress of medicine has been accomplished by this procedure and by this procedure alone.

One of the most debatable topics in social medical discussions concerns the availability of general hospital services in rural and sparsely settled areas.

ALL NEAR HOSPITALS

Spot maps, developed by the American Medical Association's Council on Medical Education and Hospitals, reveal only thirteen counties in the United States which are more than thirty miles distant from an acceptable general hospital.

There can be little disagreement on certain fundamental objectives in regard to medical care. The medical profession agrees with all other agencies on the importance of the following objectives:

The provision of good medical care for all the people; development of comprehensive preventive and public health services; development of appropriate measures to combat specific health problems, and a continuous, orderly improvement of the distribution of medical services and hospital facilities, both by geographical and economic divisions.

OTHER UNFILLED NEEDS

The medical profession would be the last to deny the existence of medical needs in the United States.

The profession, however, cannot be blind to the fact that there are other unfilled needs, especially such as relate to food, clothing, and housing, which are often as essential to health preservation as is medical care.

I think it is important to realize the historic fact that every board of health, every medical school, every hospital and every other agency which has to do with the diagnosis, prevention and cure of disease has been organized as a direct result of medical leadership.

Those people who think they can devise a centrally controlled medical service plan which can be fitted to the varying conditions of the states, counties, and cities of this country are discussing theories which no practical health administrator possibly could approve.—Los Angeles *Examiner,* January 22, 1939.

CALIFORNIA AGRICULTURAL WORKERS HEALTH AND MEDICAL ASSOCIATION

I have served as Medical Advisor * to the Agricultural Workers Health and Medical Association for a little over a month, and I find that there is a rather wide failure in understanding our purpose and our limitations, particularly our limitations.

Primarily, this organization was formed to give necessary treatment of acute and emergency medical needs in this migrant group, and their immediate dependents. This was expanded to include the care of such chronic conditions, which in a state of progress, were decreasing the earning capacity of the worker and jeopardizing his physical welfare. This was necessarily again expanded to take care of such chronic conditions in dependents as had become secondarily an emergent condition.

I sincerely believe that if the doctor will review this statement carefully and give it careful consideration when seeing these migrants, our major difficulty of misunderstanding will be solved.

We would like, as a humanitarian move, to broaden our scope and care for the obvious medical needs, but unfortunately we have to draw a somewhat arbitrary line between needs and necessity.

This division is an economic necessity, for our financial allotment is too limited for us to be philanthropic.

Let me cite for examples, three very obvious needs which confront us and in which we have to try to pick out the truly necessary with our limited knowledge of the individual cases.

Literally, thousands of these children need tonsillectomies. With years of malnutrition, exposure and repeated illnesses, chronic hypertrophic tonsillitis and adenoid hypertrophy is the rule. If we approved operation on all of these, I am sure the bill for this item alone would bankrupt the organization. We must, therefore, limit approvals to such cases as have by complications become an absolute necessity. Unfortunately others will develop complications and become necessities, but we cannot foresee these individual cases.

The same conditions prevail in the mothers in this group. With poor obstetrical care, often no obstetrical care, a very large number of these women need cervical and perineal repairs and complex laparotomy operations. Again we are forced to desert the needy and favor the urgent necessity.

---

* By Irvin Abell, M. D., President, American Medical Association.

* By Edwin R. Scarboro, M. D.

Visual disturbances, correctable by glasses, offer a grave problem. We are trying to be liberal with the children of school age and have to refuse such aid to many adults, because the true necessity does not exist, as affecting employment.

We could cite dozens of similar conditions, but these three will serve. Unfortunately perhaps, there must be some central control attempting to keep these needs and necessities differentiated. Each individual physician is inclined to form his own opinion between these two, resulting often in a considerable shift to the right or the left as the case may be, hence the necessity of a Medical Director, trying to evaluate these and giving a fair division. I expect a wide diversity of opinion, perhaps accusations of unfairness, but I assure you that I am sincere and am trying to look justly on the whole problem.

The tentative fee schedule is incomplete and will need adjustments. We have tried to adjust it as a reasonable compensation for an indigent class and hope that you will accept it on this basis.

With time, there will be many problems and adjustments, and we hope that the necessary services can be rendered and that doctors can feel that they are satisfactorily, if not adequately, compensated for their efforts.

AMERICAN MEDICAL ASSOCIATION ACTION RAISES BASIC ISSUE*

Socialized Medicine, Doctors Charge, Is Government Aim

Washington, December 24.—The indictment here this week for alleged violation of the antitrust laws of the American Medical Association and two constituent bodies has brought into the public eye probably the most powerful professional society in America—one exercising almost as strong influence over its field as ever the medieval guilds did over theirs.

The action turns on the alleged unlawful activities of the Association and the constituent medical societies of the District and of Harris County, Texas, in restraining the functioning of the Group Health Association, Inc., a medical coöperative organization of Government workers.

American Medical Association leaders assert that the activities complained of are designed solely to maintain the high standards of medical practice deemed necessary to protect the health of the American people, but the Government charges that the Association has used its great powers to force its own economic interests on physicians, hospitals, and patients alike.

COERCION CHARGED

It has done this, it is charged, by causing the expulsion from its constituent bodies of one doctor taking employment with the Group Health Association; by "coercing" another doctor to leave such employment; by inducing and seeking to induce local hospitals to refuse hospital privileges to Group Health Association physicians, and by various other coercive acts, all designed to block competition by the Group Association in the provision of medical care.

Back of the action, in the opinions voiced by members of the medical society, is an effort by the Administration to force acceptance by the medical profession of so-called "socialized medicine," and particularly of compulsory health insurance. And the physicians, holding that they cannot be charged with conspiracy to restrain trade because they are not in trade but in a learned profession, declare that they will fight the indictment to the Supreme Court if necessary.

There are indications, however, that the profession is revising its stand on some of the broader aspects of the conflict involved. Powerful as is the medical association, and as sternly as it had previously set its face against governmental or group interposition into the medical field, it has modified its position greatly in the last few months.

Thus, following charges made at the Government's Interdepartmental Health Conference here last fall that the private profession was not providing medical care for lower-income and submerged groups, the Association offered its coöperation in studying and meeting this problem. And within the last few weeks several constituent local and state medical societies have announced their own plans for group medical care on an insurance or prepayment basis.

QUESTION FOR FUTURE

Whether the Association and its constituent bodies will desist from the alleged coercive tactics—alleged to be widespread around the country—against other group health associations in the face of the present suit remains to be seen. But there is no doubt, if the Association believes it can win its suit and therefore determines to stick to these tactics, that it has strong weapons at its command.

The long indictment recites many of these.

The Association, which was formed in the middle of the last century, although not to become a close-knit organization until early in the present one, includes in its membership about 110,000 of the 145,000 practicing physicians of the country, the indictment says. Those not belonging are mostly physicians employed by governmental and private agencies and not in private practice, it is said.

The Association also has a powerful magazine, and the receipts from subscriptions, together with fellowship dues, are said to amount to several million dollars a year. The indictment makes a particular point of the charge that the Association journal, the authoritative medical organ of the country, never has been open to advocates of group medicine, although it has been asserted by Assistant Attorney General Thurman Arnold that many Association members favor such policies.

ATTITUDE OF ASSOCIATION

There is no denial from spokesmen of the Association—so far at least—that it has taken the position against group medicine of which it is accused. Rather, these spokesmen turn to the code of ethics of the Society for full justification of such action.

The essential section of this code bearing on the issue is the one asserting that it is unprofessional for a physician to dispose of his services under conditions which make it impossible for him to give adequate service and to maintain reasonable competition among practitioners.

The view behind this is that if one lay group, corporate or otherwise, enters the field of providing medical care, no matter whether on a prepayment basis or not, other groups are bound to enter the same field, creating a price competition for patients which is bound to lessen the quality of service rendered.

Another objection cited to group medicine is that it involves solicitation of patients, directly or indirectly, underbidding by physicians to get contracts to serve the group, and sometimes the receipt of profit by a lay group from the practice of medicine.

All or most of these alleged evils are held inherent in "socialized medicine" and against them the medical fraternity is pictured as determined to fight to the last ditch with the great strength of the American Medical Association.

The indictment asserts that a local medical society, by threat of discipline of a member patronizing a hospital recalcitrant to its views, can deprive a hospital of the medical staff necessary to its operation. It asserts that by expelling a member the Society can close the doors of coöperating hospitals to him and his patients.

TWO SIDES CONFIDENT

As to the outcome of the suit, the Association attorneys express confidence that it is entirely in the clear, on the ground stated that medical practice is not trade and, therefore, cannot be restrained. But from the other side it is argued that operation of a hospital is not a "learned profession," that in many cases it is entirely a private business and that in the alleged coercion of these hospitals the medical association has clearly acted in restraint of trade and free competition.—New York *Times,* December 25, 1938.

* By Frederick P. Barkley.

IN RE: COMMUNICATION FROM "THE COMMITTEE OF PHYSICIANS"*

This Committee on Medical Economics of the Medical Society of Virginia has received from Dr. John P. Peters, Secretary, a copy of certain principles and proposals on the subject of medical care. This document emanated from a group styling themselves the "Committee of Physicians." These principles and proposals were submitted for the consideration of the Medical Society of Virginia and are herewith reproduced together with comments of your committee on each item.

PRINCIPLES

1. That the health of the people is a direct concern of the government.

Comment.—We accept this only as pertaining to the care of the indigent, to the treatment of individuals whose illness constitutes a public menace, and to measures directed to the prevention of disease. We further stipulate the relative priority of the several governmental divisions; namely, local, state, and federal, in the order named.

2. That a national public health policy directed toward all groups of the population should be formulated.

Comment.—This statement needs further elucidation. If it is to be interpreted literally, it would mean the intrusion of agents of the federal government into the daily lives of everyone.

3. That the problem of economic need and the problem of providing adequate medical care are not identical and may require different approaches for their solution.

Comment.—This statement is accepted as being essentially correct, although solution of the economic problem would indirectly solve a large part of the problem of medical need. The incidence of disease rapidly increases as we go down the economic scale.

4. That in the provision of adequate medical care for the population four agencies are concerned: voluntary agencies, local, state and federal governments.

Comment.—This statement is obviously correct. Emphasis, however, should be placed on the primary position of the local government in the governmental group and on the necessity of preserving and strengthening existing voluntary agencies.

PROPOSALS

1. That the first necessary step toward the realization of the above principles is to minimize the risk of illness by prevention.

Comment.—The principle involved here has nowhere been disputed. Unwise methods have and will be opposed. The economic factor is here of paramount importance.

2. That an immediate problem is provision of adequate medical care for the medically indigent, the cost to be met from public funds (local and/or state and/or federal).

Comment.—This is largely a local problem and the degree of efficiency in medical service varies widely. Except in pauper communities, the cost should be met by the local government. Careful provision must be made to include in this group only those who are actually indigent. Pauperization of large groups of our population carries with it evils as definite and as disastrous to national welfare as do certain deficiencies in medical care.

3. That public funds should be made available for the support of medical education and for studies, investigations and procedures for raising the standards of medical practice. If this is not provided for, the provisions of adequate medical care may prove impossible.

Comment.—The intrusion of the Federal Government into the field of medical education is objectionable and can only lead to political control. This is in no way comparable to state-supported medical departments in state universities. It should also be emphasized that other factors besides a free flow of funds are concerned in the problem of raising the standards of medical practice and in promoting medical education.

4. That public funds should be available for medical research as essential for high standards of practice in both preventive and curative medicine.

Comment.—This may be agreed to provided it does not involve federal subsidy and consequent control of voluntary agencies now operating. Federal funds cannot be accepted without sacrificing an agency's fundamental independence.

5. That public funds should be made available to hospitals that render service to the medically indigent and for laboratory and diagnostic and consultative services.

Comment.—This can be accepted in principle with the provision that these funds be largely furnished by the local government. Federal grants would tend to build up certain favored medical centers and would be dictated by political consideration rather than by actual needs.

6. That in allocation of public funds existing private institutions should be utilized to the largest possible extent and that they may receive support so long as their service is in consonance with the above principles.

Comment.—Voluntary institutions should certainly be utilized to the fullest. In order to pass on the merit of this proposal, detailed information as to the plan should be available. It is absolutely necessary to preserve the independence of the voluntary institution and political control must be avoided. It is worthy of note that the Federal Government failed to follow this principle in providing medical care for veterans. That their independence can be preserved on the basis of federal subsidy is doubtful. One must be possessed of a childlike simplicity to believe that in distributing large sums to voluntary institutions the determining consideration would be the institutions' needs and their scientific efficiency.

7. That public health services, federal, state and local, should be extended by evolutionary process.

Comment.—This proposal can be agreed to provided the order is reversed to local, state, and federal, and provided the public health service be restricted to its proper field of prevention.

8. That the investigation and planning of the measures proposed and their ultimate direction should be assigned to experts.

Comment.—Investigation and planning by experts is desirable if these experts are drawn from the ranks of those who have gained familiarity with medical needs by actual experience. Direction of such a varied program cannot safely be centered in one group. The principle of local control should be maintained.

9. That the adequate administration and supervision of the health functions of the government, as implied in the above proposals, necessitates in our opinion a functional consolidation of all federal health and medical activities, preferably under a separate department.

Comment.—We see no necessity or advantage in a federal department of health. There would be a grave danger of political and partisan control of such a department, especially if its activities were widened to any such extent as has been advocated. To place $850,000,000 annually in the hands of one agency, to be expended through various channels, would mean the concentration of tremendous power in that agency. Schools, research laboratories, and other beneficiaries would be anxious to secure and maintain the approval of such an agency, so that there would be a prompt and uninterrupted flow of funds into their treasuries. Anyone who believes that these organizations would preserve their independence of thought and action is lacking in fundamental knowledge of human reaction.

---

* Part of the report of the Committee on Medical Economics of the Medical Society of Virginia, that was adopted at the annual meeting of the Medical Society of Virginia, October 4-6, 1938. See also press item on page 160, second column.

Your committee feels that these principles and proposals in general tend to advocate a dangerous extention of federal control in the realm of medicine. This control may be exerted directly through additional power and authority vested by law in a federal agency, or more insiduously through the power to control the grants of subsidies to schools, hospitals, and research institutions. Many of the proposals are acceptable in principle, but are so vague and general as to the method to be pursued that they cannot properly be evaluated. They represent the views of a group who are largely engaged in institutional work and who have had little contact with the situation in the general medical field.

While we readily grant the right of any individual physician to propose and advocate any course that he may deem wise, we denounce the action of a small minority group that sets itself up to speak for American medicine.

While this committee contains the names of many physicians eminent in the teaching and laboratory field, and while we do not doubt their sincerity of purpose, we do question their fitness to pontificate on this particular subject. We know of no special source of information that they possess that is not open to every intelligent physician in the United States and their actual experience and contacts, largely limited to institutional work, do not especially qualify them as experts on the subject of their declaration. Especial eminence in one field may beget a certain arrogance of opinion on other subjects that is not actually justifiable.

These so-called "rebels" had another recourse. Over one hundred thousand physicians are organized in the American Medical Association. The objects of this organization are "to promote the art and science of medicine and the betterment of public health." Its legislative body is made up of representatives of each state and of delegates from the various sections of the scientific assembly and from the medical departments of the army, navy, and public health service. The House of Delegates of the American Medical Association is a truly representative body and it establishes and fixes the principles upon which our national organization operates. Our Board of Trustees is made up of a group of earnest and able men who are just as wise, just as experienced, and just as conscious of their obligation to society as any group that may be called together. They devote, during their term of service, a large part of their time to working out the plans and policies of our association. We feel that the proper approach of these gentlemen of the committee should have been through the channels of their local and state societies and the American Medical Association.

In support of these views, we submit the following resolutions:

Whereas, The "Committee of Physicians" has submitted to the House of Delegates of the Medical Society of Virginia certain principles and proposals on the subject of medical care; and

Whereas, The contents of this document have been reviewed and our opinions set forth in the above discussions; therefore, be it

Resolved by the House of Delegates of the Medical Society of Virginia, duly assembled at Danville, Virginia, on the 5th day of October, 1938; That we endorse this report of our Committee on Medical Economics concerning these principles and proposals; and be it further

Resolved, That a copy of these resolutions be sent to Dr. John P. Peters, Secretary, "Committee of Physicians," a copy to the Board of Trustees of the American Medical Association, and a copy to the secretary of each state medical society.

THE "IDEAL NARCOTIC"

After a nine-year quest, scientists eager to find an "ideal narcotic"—one which will control pain but not induce addiction—have reported that discovery of the drug lies in the future and that it is necessary to continue active research toward that end.

More than three hundred compounds—almost half of them morphin derivatives, the majority of which were made for the first time in connection with this work; the remainder synthetic substances—have been systematically tested. Those related to the morphin molecule that were tested on man were found to possess more or less addiction liabilities.

Results of these studies, conducted by a number of cooperating agencies having responsibility for the solution of the problem of developing some means of reducing or correcting the evils of drug addiction, were recently made known by the United States Public Health Service (Public Health Report, Supplement No. 138).

Dr. William Charles White is chairman of the Committee on Drug Addiction, Division of Medical Sciences, of the National Research Council, under whose auspices the studies were directed with funds provided by the Rockefeller Foundation. "It was recognized," said Doctor White in the report, "that the problem of drug addiction had reached a high point in international and national affairs which demanded attention, and a very considerable expenditure. It is to be remembered, however, that this problem is only a part of the far greater one of mental health, which in all its branches is probably the most serious welfare problem with which this country has to deal."

The supplement, extending to 143 pages, contains a vast amount of hitherto uncompiled data. It describes not only the chemical properties, but the method of preparation and pharmacological activities of the compounds tested. In addition to the text, there are included in tabular and other forms the chemical and structural formulae of these compounds on the basis of their chemical relationships; and complete summaries and bibliographies relating to each part of the report. At the conclusion of the book there is a list of all the publications that have been made under the direction of the Commission since its beginning. Many of these have been published in the Public Health Reports.

Divided into three sections, the report takes up first the discussion and conclusions drawn from research with 125 morphin derivatives. From these studies it is apparent that specific chemical modifications affect uniformly neither in direction nor degree all of the pharmacological actions of alkaloids of this series.

The second section discusses chemicopharmacological reactions for more than two hundred synthetic substances built upon phenathrene, dibenzofuran, and carbazole. Applied to mice, rats, rabbits, and cats, some of these synthetics, especially in the carbazole series, evidence a considerable degree of pain controlling action. All of them, however, exhibited "side actions" more or less undesirable.

The concluding section of the report reviews clinical studies made at the United States Penitentiary Annex, Fort Leavenworth, Kansas, and at the United States Public Health Service Hospital, Lexington, Kentucky. This latter section aimed especially to determine the addiction liability of some sixteen selected morphin derivatives.

This portion of the booklet reviews a working method of quantitative evaluation of the phenomena of abstinence, and discusses tolerance, habituation, and dependence with their relations to drug addiction. With the aid of a most modern encephalograph, built at the Lexington Hospital, the Public Health Service has for the first time an implement for studying the differentiating action of a series of addiction drugs of known chemical modification in the study of brain physiology. This instrument aids in overcoming impediments to the study of cerebral and other living responses of the nervous tissues, and provides a new objective technique for studying the living neuro-electric reaction.

TWENTY-FIVE YEARS AGO[†]

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XII, No. 2, February, 1914

From Some Editorial Notes:

Why Not Save the Money?—One of our advertisers is good enough to give us information in regard to specific instances wherein his advertising in your Journal does or does not pay. A customer came to his store and, noticing a certain article, remarked that he did not know they carried that; he had just bought one from an eastern house and had had to pay the same price, plus the express charges of $3.40. And that very article had been advertised in your Journal. The local dealer would have saved that member at least $3.40. Does it pay to look through the advertising pages? It would have paid that one doctor on that one purchase, $3.40; how much more he has thus foolishly spent it is impossible to say. Another definite instance where a member bought from an eastern house an article advertised in your Journal by a local dealer, is one in which the article cost the purchaser 25 per cent more than he could have bought it for right here at home. It is safe to say that members could save much more than the amount of their annual dues if they would look through the advertising pages of their Journal and purchase goods from their own advertisers. "It pays to advertise," is very true; it is also and equally true that "It pays to read advertisements!"

* * *

Suits for Damages and Their Defense.—Some of our members who have joined in the last year or so do not understand that the State Society has a legal department of the very best and that it defends its members, without cost to them other than their regular dues and assessments, in all such actions. Membership in the State Society, because of this one feature alone, is now one of the most valuable assets that a practicing physician can have. The suits which we have defended, all of them successfully, in 1913, would have cost the individual physicians sued a great many thousands of dollars—and they would not all of them have been won. Our legal department is so well up in this work and our lawyers are of such high standing that in many cases where the member has also had insurance in some company, he has requested our attorneys to take charge of his case. . . .

Could any rules be simpler? Suits are increasing rather than decreasing; there seems to be a craze to "sue the doctor"; are you protected? You do not and cannot know what day some disgruntled patient may sue you. It is much wiser to pay the few dollars a year your dues cost you than many hundreds or thousands of dollars it would cost you to defend a suit. Medical defense by the State Society is real defense; it defends.

* * *

A New Medical (?) Organ for "Slamming."—Apparently, there were not in existence enough so-called medical (?) journals living on fraudulent and deceitful advertising and so desirous of slamming the American Medical Association; a new publication has been started, but whether it will be parasitical and thrive on the nostrums is not yet certain; it is young, very young, and its circulation is bound to be small, very small. It is the journal of the American Medical Editors' Association, that highly upright and cleanly organization of which mention has been made before in the pages of the Journal. Vol. 1, No. 2, is the issue under present observation, and it contains three separate items that are intended to be deliberate slams at the Association. . . .

* * *

A Suggestion for Help.—The Santa Barbara County Medical Society publishes a printed announcement and program of meetings which is sent out to the members a week or ten days in advance. This is an excellent idea in itself, but it was not the particular thing in mind. A few months

(Continued in Front Advertising Section, Page 15)

[†] This column strives to mirror the work and aims of colleagues who bore the brunt of Association activities some twenty-five years ago. It is hoped that such presentation will be of interest to both old and new members.

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA[†]

By Charles B. Pinkham, M.D.
Secretary-Treasurer

News

"Unable to raise bail after it was boosted from $1,500 to $2,000 cash at a preliminary hearing before Municipal Judge Herbert C. Kaufman, Mrs. Lena Mareck, fifty-six, was jailed today on charges of performing an illegal operation in connection with the critical illness of an Oakland woman. . . . Inspector Harry Husted of the homicide detail asked that her bail be increased, pending the outcome of the condition of Mrs. Dolly Murray in Peralta Hospital in Oakland. . . . Mrs. Mareck was arrested at her home, 819 Ocean Avenue, on the request of Oakland authorities. Mrs. Mareck's son, 'Dr.' Andrew Mareck, was charged seven years ago with the murder of Mrs. Anita Lund, nurse at the Laguna Honda Home, who was found dead from the effects of a crudely performed operation. She had been beaten until her face was almost unrecognizable. Mareck was acquitted of the Lund murder after two trials, but was sentenced to San Quentin in 1933 to serve life for the murder of Special Officer William Garrick during a Santa Rosa robbery. . . ." (San Francisco *Call-Bulletin*, January 5, 1939.)

According to the San Francisco *Call-Bulletin* of January 2, 1939, former Governor Merriam made the following appointments:

Roy Labachotte, Redwood City, member, State Board of Chiropractic Examiners, vice Raymond C. Foy, term expired.

Joseph T. Stacy, Sacramento, member, State Board of Chiropractic Examiners, vice M. H. Disney, San Diego, term expired.

Selma M. Giese, Los Angeles, member, State Board of Chiropractic Examiners, vice C. O. Hunt, Oakland, term expired.

Russell C. Willett, San Francisco, member, State Board of Chiropractic Examiners, vice self, term expired.

Melville Z. Ellis, Long Beach, member, State Board of Chiropractic Examiners, vice C. E. Walker, Redding.

"A doctor is not criminally responsible for the hiring of a nurse, the appellate department of the Superior Court ruled. In a brief memorandum opinion the Court said. . . . 'At most the promise of defendant to see that the complaining witness would get paid was, in our opinion, a mere guaranty of the primary obligation of the patient to pay his nurse, and not the assumption of that primary obligation by the defendant doctor. That being so, not only was the promise unenforceable, because not in writing (C. C. 1624, sub. 2), but we do not believe that defendant falls within the class intended to be covered by Section 216 of the Labor Code.' Doctor Blank was adjudged guilty of violating Section 216 of the Labor Code by Municipal Judge Theresa Meikle on complaint of Pauline Washauer, a registered nurse, for the alleged nonpayment of wages. He was given a thirty-day suspended sentence and granted probation with the direction to pay $24, claimed to be owing to the nurse. Attorney Frank A. Flynn, on behalf of his client, contended that the doctor's attempt to see that the hospital and nurse's bills were paid did not impose any obligation upon himself, and the fact that the patient had no money did not justify criminal proceedings. It was also contended that he acted in the position of directing employment and not employing nurses." (San Diego *Transcript*, December 31, 1938.)

"A sweeping proposal to 'extend to the people of California the benefits of medical science along the same lines as educational benefits now being enjoyed,' was sent to Attorney-General U. S. Webb today in the form of an

episodes the field force put a greater part of its time into drug supervision than last year—33 per cent as compared with 29.4 per cent in 1937.

Reviewing briefly the five-year effort for revision of the Food and Drug Act, Mr. Campbell says that this effort "produced a measure that will unquestionably afford greatly increased public protection even if it does not contain all of the provisions its advocates have urged." A few provisions became effective immediately, but the general provisions of the new law do not supersede the old act until June 25, 1939.

In general the report follows those of previous years and includes comparative statistics of the time and effort devoted to various phases of enforcement.

One new phase of enforcement is the investigation of the reworking of returned stocks of candy. Some manufacturers have been distributing objectionable goods, but the administration was unable to act until it could perfect analytical methods that would prove convincing in court tests. A survey showed conditions were good in the great majority of plants where returned candy is reworked, but deplorably unsanitary in a few cases. "The campaign," says the report, "will be continued until interstate traffic in this type of filthy confectionary is stopped."

Maple syrup producers responded to the educational campaign of the previous year for abandonment of equipment and utensils containing lead, which may make the syrup unfit for food. Nevertheless, out of 300 samples, 22 contained too much lead and shipments were seized.

The Administration investigated about the usual number of cases of suspected food poisoning—76. As usual, no case of botulism was found that could be traced definitely to commercially canned foods.

The salmon pack was in excellent condition and no seizures were necessary, a result both of favorable weather and greatly improved conditions which canners have adopted for their own protection. Some canned tuna was detained on account of lead from containers or because of decomposition.

Under the McNary-Mapes amendment, there were 153 seizures of canned goods that failed to meet the standards of quality, condition, or fill of container.

The quality of ether was materially improved, with less than 4 per cent of the samples failing to meet requirements as compared with more than 8 per cent in 1937.

Research work was devoted to improving test procedures for biological vitamin products and drugs. Laboratory technicians are making special efforts to improve tests for the decomposition of food products.

The Administration also reports briefly developments in the enforcement of other legislation for which it is responsible—the Insecticide Act, the Caustic Poison Act, the Import Milk Act, the Tea Act, the Filled Milk Act, the Naval Stores Act, and the Certification of Coal-Tar Colors.

Cancer Research.—"More intensive work will gradually solve many of the problems still facing scientists engaged in cancer research," is the statement of Dr. Carl Voegtlin, Chief of the National Cancer Institute, after a study of thirty years of activity in that field.

A survey of the last three decades of fundamental cancer study is contained in the current issue of *Public Health Reports* (Vol. 53, No. 48). It shows that a considerable amount of knowledge concerning cancer has been acquired during that period through experimental research.

The report was formulated by a committee of outstanding scientists appointed by Dr. Thomas Parran, Surgeon General of the United States Public Health Service. The committee members were Dr. James B. Murphy and Dr. John Northrop of the Rockefeller Institute for Medical Research; Dr. Stanhope Bayne-Jones, professor of bacteriology and Dean of the School of Medicine, Yale University; Dr. Ross G. Harrison, chairman of the National Research Council and Sterling professor of biology, Yale University; Dr. Clarence C. Little, director, Roscoe B. Jackson Memorial Laboratory.

This marks the first time that efforts have been made to formulate in one plan the fundamental aspects of cancer

(Continued on Page 36)

OLEUM PERCOMORPHUM (Liquid)

10 and 50 cc. brown bottles in light-proof cartons. Not less than 60,000 vitamin A units, 8,500 vitamin D units (U.S.P.) per gram. 100 times cod liver oil* in vitamins A and D.

FOR GREATER ECONOMY, the 50 cc. size of Oleum Percomorphum is now supplied with Mead's patented Vacap-Dropper. It keeps out dust and light, is spill-proof, unbreakable, and delivers a uniform drop. The 10 cc. size of Oleum Percomorphum is still offered with the regulation type dropper.

OLEUM PERCOMORPHUM (Capsules)

Especially convenient when prescribing vitamins A and D for older children and adults. As pregnancy and lactation increase the need for vitamin D but may be accompanied by aversion to large amounts of fats, Mead's Capsules of Oleum Percomorphum offer maximum vitamin content without overtaxing the digestive system. 25 and 100 10-drop soluble gelatin capsules in cardboard box. Not less than 13,300 vitamin A units, 1,850 vitamin D units (U.S.P.) per capsule. Capsules have a vitamin content greater than minimum requirements for prophylactic use, in order to allow a margin of safety for exceptional cases.

Uses: For the prevention and treatment of rickets, tetany, and selected cases of osteomalacia; to prevent poor dentition due to vitamin D deficiency; for pregnant and lactating women; to aid in the control of calcium-phosphorus metabolism; to promote growth in infants and children; to aid in building general resistance lowered by vitamin A deficiency; for invalids, convalescents, and persons on restricted diets; for the prevention and treatment of vitamin A deficiency states including xerophthalmia; and wherever cod liver oil is indicated.

(Continued from Page 34)

research. In releasing the information Doctor Voegtlin stated that the committee undertook a difficult task in formulating a plan on fundamental cancer research because of the complex nature of the subject, but he felt that the comment will greatly help to clarify the facts which already have been established in this field. The report thus attempts to check and critically evaluate the results to date, as well as to suggest the lines for future activity.

The report pointed out that certain chemicals, radioactive materials, x-rays, and biological products including viruses are already known to cause cancer. What is now most needed, the committee pointed out, is work which will explain why and how these different agents produce cancer. This line of research is concerned with cell physiology. Efforts should be made to explain how these various substances and agents produce the transformation of normal cells into cancer cells. This is the crux of the cancer problem, according to the group of scientists which makes up this committee.

Another point of needed investigation, according to the report, is a study of the question of why the cancer cell behaves as it does. Research scientists are eager to know why cancer cells show such unlimited and uncontrolled growth in the body. It is yet to be determined whether this behavior of cancer cells is due to differences in chemical makeup, or to some other factors. Solution of this problem would provide in all probability the key to the real causes of cancer. The report pointed out, however, that such problems require much patience and much time for their completion.

Continued search for new methods of treatment of cancer is also urged by this report on fundamental cancer research. The matter of the routine trying out of new things which might be of use was encouraged, because sometimes this type of investigation leads to highly important results. An example along this line is the cyclotron, a new atom-smashing machine, which produces radioactive material which may possibly become of value in the treatment of cancer and other malignant diseases.

The report stresses that cancer research of the future should continue to be concerned with the relationship of heredity to this disease, and lays emphasis upon the study of different types of cancer since they are almost like different diseases. With respect to studies of heredity, the report states that "from the practical side, this general field has assumed an importance for it is probable that preventive measures will come from knowledge gained from this type of investigation."

In considering the ways and means of carrying on future studies, it was evidenced by the report that the field of experimentation with animals, principally mice, would be essential. The report states, "in this connection it has become evident that pure strains of animals of known hereditary tendencies are as important for cancer research as pure chemicals are for the chemists."

The report, furthermore, approves collaboration between the research institute and the newly established cancer clinic of the Public Health Service in Baltimore, Maryland. This coöperation is recommended with a view to detecting and utilizing clinical problems for research in the laboratory, and testing in the clinic promising methods suggested by laboratory experimentation.

The report is designed primarily to assist the Government in its program to control cancer. At the same time it points out to research workers generally and other scientists and physicians the accomplishments to date and the needs ahead. It is believed also that the report will have considerable value to organizations and individuals who may be considering the financing of projects in cancer research and treatment.

Doctor Voegtlin stated that scientists of the National Cancer Institute are already investigating some of the basic problems mentioned in the report and that after the completion of the Institute's laboratory, work will be carried forward on a broader basis and with increased vigor.

Far from being a curse, eyeglasses are indeed a blessing, without which the majority of people would be unable to cope with the demands of civilization.—*Hygeia.*

RECENT ADVANCES IN THE SCIENCE OF NUTRITION

VI. The Chemical Identification of Thiamin or Vitamin B_1

● An outstanding accomplishment of American Biochemical research has been the chemical identification—by degradation and by synthesis—of thiamin or pure vitamin B_1 (1). Thus, another dietary essential long known by its physiologic functions has been identified chemically, in this instance as a quaternary thiazole.

This discovery is of the most basic importance in the field of vitamin B_1 research. Determination of the chemical nature of this factor permits not only explanation of certain previously known facts concerning vitamin B_1, but in addition, has opened new fields of research. One of these is already concerned with the development of a reliable chemical method for estimation of thiamin which will be generally applicable to foods.

At present, quantitative determination of vitamin B_1 necessarily requires the use of one of the several bioassay methods available for that purpose. None of these is entirely satisfactory (1, 2). Perfection of a chemical method for quantitative measurement of thiamin in foods would add greatly to our knowledge of its occurrence in nature, as well as permit more comprehensive studies of factors which might influence the stability of vitamin B_1 in foods. We have a relative paucity of such data relating to vitamin B_1 when the available information on vitamin C is considered.

It should also be stated that the synthesis of thiamin—which is now produced on a commercial basis—has already provided the clinician with a most useful diagnostic tool. Administration of the pure vitamin in cases of suspected thiamin deficiency, with notation of the therapeutic response, constitutes the most trustworthy means of detecting avitaminosis B_1. After the diagnosis has been confirmed and the immediate deficiency corrected by administration of thiamin, it is desirable that future adequate supply of vitamin B_1 be obtained through dietary readjustments (1).

In this connection, commercially canned foods deserve particular mention. Nutritional research (3, 4) on various members of this class of foods has demonstrated their potential value when included in a varied diet calculated to supply optimal amounts of vitamin B_1.

Medicine on Parade: The Medical Program for the Hall of Science, Golden Gate International Exposition.* Latest advancements in medical science, new weapons of the war on disease, and most recent methods of treatment, are demonstrated in the many amazing exhibits in the Hall of Science at the 1939 Golden Gate International Exposition on San Francisco Bay.

Believing that future medical progress depends largely upon educating the public to the advances which already have been made, a number of leading medical men have spent two years in organizing the exhibits. This "parade of medicine," however, is no ordinary recital of accomplishments, but a dramatic, confidence-inspiring display of progress with explanations of problems still unsolved. In general the exhibits emphasize the necessity of constant coöperation of a patient, actual or potential, with his physician. They show also the practical, particularly the financial, benefits of preventive medicine. Of particular importance in the matter of medical education of the layman is the honest and accurate presentation of such hitherto unmentionable subjects as cancer, venereal diseases, and the chemical factors involved in sex.

These subjects and many others are clarified for the spectator through an efficient combination of exhibits, motion pictures, and lectures. The medical leaders who gave much of their time and efforts to arrange exhibits and lectures have constantly emphasized the prophecy that if only one visitor in every hundred can learn how to avoid tuberculosis or pneumonia or cancer, the resultant benefits to the country will be felt for generations.

As part of the medical program for 1939, Dr. Milton Silverman, Exposition head of the Hall of Science, and his committee arranged a complete schedule of lectures, which are held in the auditorium of the Hall of Science. Many of the scheduled speakers are distinguished research workers or clinicians from Europe and eastern United States. Others are outstanding specialists in the great universities, hospitals, and research centers of the West Coast. All these lectures will be addressed primarily to the laymen—presented in popular language and on subjects which vitally affect his well-being. Many are directed particularly to school children. Lecture topics have been planned to harmonize with exhibits in the Hall of Science. Many of these talks will be heard over coast-to-coast radio hookups.

Realizing the tremendous importance of the moving picture in modern education, the Advisory Committee on Medicine presents hundreds of reels of moving pictures in the Hall of Science auditorium, to show the most modern, accurate information on the structure, development and workings of the human body, and on the cause, prevention and treatment of scores of important diseases. These film programs offer to the public its first opportunity to see actual details of work which is proceeding daily behind closed doors in research laboratories, clinics, and hospitals.

Many of the great medical associations of the West and of the United States developed the special programs centered around the Hall of Science.

Among these groups are the American and the California Medical Associations, the California State and American Dental Associations, the American College of Physicians, the American Association for the Advancement of Science. Many other societies are holding conventions or "special day programs" at the Exposition.

Scheduling of these programs assures Exposition visitors of outstanding lectures by the country's outstanding medical men—"talks by the men who did the work themselves."

Approximately 50,000 square feet of exhibit space—well over an acre—have been assigned to accommodate medical exhibits in the Hall of Science. After more than a year of intensive work, the director and the Advisory Committee reported that this entire section was under contract—without a single "commercialized" exhibit and without any duplication of exhibit material. A review of the Hall of Science follows:

General Medicine.—The "keynote" exhibit of the medical section, sponsored by the American Medical Association, includes material on four important fields of health work.

---

*By Charles F. Berry.

First, is a display on the history of medicine and the heroes of medicine in the United States, and particularly in the countries bordering the Pacific Ocean.

Visitors will see what these countries have contributed to international health, as exemplified by the work of such men as Ephriam McDowell in surgery, William Beaumont in physiology, Crawford Long in anesthesia, Oliver Wendell Holmes in puerperal fever, J. Marion Sims in surgery, William H. Welch in gas gangrene, Theobald Smith in tick fever, Walter Reed in yellow fever, William C. Gorgas in sanitation, and Howard Ricketts in Rocky Mountain spotted fever.

The American Medical Association pays homage to a number of great western men of medicine—the California Indians, who introduced Spanish explorers to cascara and other native drugs; Petro Prat and his hospital at San Diego; Marcus Whitman, the first physician in the Pacific Northwest; the San Francisco pioneers—H. H. Toland, Levi Cooper Lane, Elias Cooper, Richard Cole, and James Blake; the Japanese bacteriologists—Kitasata and Shiga; and two great Chinese—Hua T'o, a surgeon who lived in the second century A. D., and Pien Ch'iao, who studied anesthetics seven centuries before the birth of Christ and twenty-five centuries before the discovery of ether.

A second section in this exhibit explains the various subjects involved in modern medicine and shows, by animated displays, the significance of such basic sciences as physics, chemistry, and zoölogy, and of such clinical fields as pediatrics, neurology, surgery, dermatology, urology, obstetrics, internal medicine, ophthalmology, and otolaryngology.

A third section is based on contributions of medicine to public health, and shows the various public health activities which were instituted largely by the medical profession. Here is illustrative material on communicable disease control, epidemiology of important infections, control of food handlers and food supplies, water protection, sewage disposal, health education of the public, protection of milk, vital statistics, and the like.

In the fourth section the American Medical Association deals with a novel and highly important combination—medicine and physics. Here emphasis is placed on the apparatus used in medicine, particularly in medical diagnosis. Displays range from animated explanations of the thermometer and hypodermic syringe to the x-ray apparatus and the microscope.

In charge of the entire American Medical Association display is Dr. Thomas Hull.

Dentistry.—Competing with general medical exhibits for public appreciation and coöperation is the large exhibit sponsored by the American Dental Association in conjunction with the California State Dental Association.

In this section, visitors will see dramatic exhibits of both the esthetic and clinical aspects of modern dentistry. They will see, by electrically animated displays, the influence of teeth upon appearance and upon health and efficiency. They will see the history of teeth—in exhibits on the historical relationship between teeth, diet, and facial appearance—and the history of a tooth—in an exhibit showing the anatomical and physiological development of teeth.

Dental disease and its prevention is emphasized in exhibits on dental decay, pyorrhea, and other pathological conditions. Of particular interest in this section is the "talking tooth" and its lecture on mouth hygiene. Diagnosis of dental disease is explained in a featured exhibit on x-ray diagnosis.

The progress of dentistry during the past century is outlined by a series of displays showing the appearance of a dentist's office in 1839, a similar office in 1939, and the intervening steps which account for the tremendous changes. Special exhibits on tooth straightening and tooth repair are displayed, and a question box is provided for the benefit of visitors who may desire additional information.

The dental display is under the direction of Drs. Lon Morrey of Chicago, Wilfred Robinson of Oakland, and John Leggett of San Francisco.

Surgery.—Two separate exhibits have been designed to illustrate the modern advances in surgery, and the rôle of surgeons in combating disease and disfigurement.

One is based entirely on plastic surgery, and is sponsored by the St. Francis Hospital of San Francisco. In this area is displayed the present status of this particularly dramatic subject, and the methods used by plastic surgeons. Rather than emphasize the use of plastic surgery as a type of "beauty treatment," this exhibit ignores the completely esthetic features and stresses repair of congenital and accidental disfigurement.

Special sections are devoted to the surgical repair of congenital cleft palate and harelip, burns, damaged fingers and hands, and disfigurement resulting from automobile accidents. Of particular significance to the visitor are simple explanations of the methods involved, particularly the transplanting and grafting of bone, muscle, nerve, blood vessel, fascia and other tissues from one part of the body to the other.

Dr. George Warren Pierce is in charge of the plastic surgery exhibit, with Dr. Loren Chandler of the Advisory Committee.

The chief surgical exhibit is under the sponsorship of one of the greatest medical institutions in the world, the famed Mayo Foundation of Rochester, Minnesota. This

For Acidity and Allied Conditions, we suggest
ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

A Natural Mineral Water

display has been especially prepared by Mayo scientists, to teach some fundamentals of human anatomy, to explain the function of certain important organs, and to describe some of the recent important discoveries which enable the physician and surgeon to cure or control disease and correct abnormalities.

As an introduction, there is first a section devoted to anatomy, with five life-size models of the human body, constructed from semitransparent materials. These show the chief organs of the body—their size, location, and relationships. Additional exhibits show "close-ups" of these organs, to explain their complicated intricacies. The action of the heart and lungs is shown in particular detail by specially constructed animated models and diagrams.

Another section of the Mayo exhibit is devoted to anesthesia, and shows particularly the modern methods of producing local anesthesia, in different parts of the body.

The major portion of the area, however, is set aside for exhibits on diseases of the gastro-intestinal tract and their treatment by surgical methods. Included are displays on operations for gastric ulcer, gastric cancer, and appendicitis.

Other sections of the exhibit house material on treatment of bladder and prostate gland diseases, thyroidectomy, and bone grafting for the treatment of fractures.

In charge of the Mayo exhibit is Dr. Arthur Bulbulian of the Mayo Foundation museum, with Doctor Chandler of the committee.

Red Cross.—Known throughout the world, but primarily for its work in first aid and emergency relief, the American National Red Cross makes its appearance in the Hall of Science as a scientific institution of high rank.

The public will see for the first time the modern research work carried out by Red Cross scientists in fighting pellagra and other nutritional diseases, in developing "blood banks" for life-saving following accidental hemorrhage, in combating typhus fever and plague, and in aiding other medical groups to adopt the newest and most modern weapons which the laboratories have produced.

In addition, the Red Cross exhibit shows new details in the more familiar work of the society—flood relief, care of sick and homeless refugees in stricken areas, erection and maintenance of emergency hospitals during epidemics, and first aid to victims of home, swimming pool and highway accidents.

The direction of the exhibit is under Dr. William DeKleine, D. H. Moore of the Red Cross, and Doctor Silverman of the committee.

Cancer.—As one of the real high spots of the entire Exposition, research workers and practicing physicians have combined their efforts to tell—for the first time in history—a modern story of the causes, diagnosis, prevention and cure of cancer.

For generations, scientists and laymen alike have been awaiting the reported discovery of the cause and cure of cancer. Yet, today, enough is known about this most mysterious of all diseases to justify a report of present status to the public.

The long-awaited information has been culled from the greatest medical research institutions in the world. It is by no means sensational in character—every detail of the exhibit has been checked by the Cancer Commission of the California Medical Association, the exhibit sponsor—but the story of the exhibit marks one of the most brilliant advances in medical history.

The exhibit has been arranged in the simplest possible form—as questions and answers. The queries include: What is cancer? What causes it? Is it inheritable? How does cancer spread and cause death? Can it be diagnosed? Can it be treated? Can it be cured? Can it be prevented?

Included in the replies are accurate, non-evasive answers, demonstrations of chemicals and physical factors which have been found to cause cancer, demonstrations of diagnostic methods, and explanations of the three types of curative procedures.

The cancer exhibit is under the direction of Drs. Alson Kilgore of the Cancer Commission, T. Henshaw Kelly of

Measles Modification with

IMMUNE GLOBULIN (Human)

Lederle

FIVE YEARS OF CLINICAL STUDY and laboratory investigation of this serum have proved its value in the modification of the attack and the lessening of the dangerous complications of measles.

Two published reports[1, 2] of this study are significant. Others are in preparation. These observations indicate that as little as 2 cc., if injected intramuscularly within 6 to 8 days after the initial intimate exposure, is effective in children under 2 years of age.

Older children require larger doses.

It is believed by some authorities that 2 to 3 times the indicated modifying dose will often prevent the attack entirely.

There is no satisfactory evidence available that an attack of measles can be modified by administration of any practical dose of Immune Globulin (Human) after the characteristic symptoms of the disease have appeared.

the State Medical Association, and Milton Silverman of the Advisory Committee.

Chemicals versus Disease—Syphilis, Malaria, Streptococcus Infections.—That branch of medicine which deals with medical applications of chemicals—pharmacology—recognizes only three types of drugs which cure disease. These are the arsenicals and bismuth preparations used in treating syphilis, quinin and its derivatives used in malaria, and sulfanilamid and its derivatives used in combating streptococcus infections (childbed fever, scarlet fever, blood poisoning), meningitis, certain types of pneumonia, and gonorrhea.

In an exhibit sponsored by the Winthrop Chemical Company, the brilliant records of these drugs are presented in popular terminology.

Of particular current interest is the section devoted to syphilis. Here, emphasis is placed on the diagnostic tests and on the treatment. Other phases of syphilis are presented elsewhere (see below).

Among the methods of diagnosis, special attention is given the Wassermann test on blood and spinal fluid, and the darkfield test on suspected lesions.

Other exhibits on syphilis are devoted to the manufacture of drugs, their chemistry, their control for purity, their use in the patient, and the results of treatment. The exhibit is kept up to date by inclusion of material on the treatment of tertiary or neurosyphilis with artificial fever.

In the second section of the Winthrop exhibit, displays relate the romantic history of quinin—its first use by Peruvian Indians, its discovery by Spaniard explorers, its monopoly by the Peruvian Government and the breaking of this monopoly by European adventurers.

The exhibit brings this story up to date by describing the development of new synthetic substances, such as atebrin and plasmochin, and the control of malaria by sanitary engineering methods.

The third section tells the most modern achievements of chemotherapy—the development and use of sulfanilamid. Visitors will see how this drug was developed in European laboratories and then applied in Euprope and the United States to treat deadly streptococcus infections, meningitis, and other diseases.

The exhibit is under the direction of Dr. Martin Lasersohn of Winthrop and Dr. Leake of the committee.

Venereal Diseases.—As an addition to the Winthrop Chemical Company exhibit on chemotherapy and as a practical climax to the current fight for sane education against venereal disease, the California State Department of Health is sponsoring a large, complete display on syphilis and gonorrhea.

In this state exhibit, no mention is made of diagnosing or treating; instead, efforts of the department's workers are directed toward an exposition of the cause, the epidemiology and the results—physical, mental, and sociological—of venereal infections.

(Continued on Page 44)

S.M.A. —FOR INFANTS DEPRIVED OF BREAST MILK

When diluted according to directions, S.M.A. closely resembles human milk, *NOT ONLY* in the percentages of protein, fat, carbohydrate and ash, *BUT ALSO* in the chemical constants and in physical properties.

When fed to infants as a supplement, complement or as a complete substitute for breast milk, S.M.A. consistently produces excellent nutritional results comparable to those obtained with normal breast-fed infants.

The quick, easy method of preparing S.M.A. feedings is unusually simple. A Minute Mix Method Set together with complete directions will be sent Free to physicians on request.

S.M.A. is a food for infants . . . derived from tuberculin tested cows' milk, the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil; with the addition of milk sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, it is essentially similar to human milk in percentages of protein, fat, carbohydrate and ash, in chemical constants and in physical properties.

Transportation of Sick Since 1906

2570 Bush Street **Telephone WEst 1400**

PHYSICIANS' AND SURGEONS' TELEPHONE EXCHANGE • NURSES' BUREAU

(Continued from Page 42)

Visitors will see enlarged models of the responsible microbes, the methods whereby they destroy tissue and the way in which they spread. Carefully selected pictures illustrate the easily recognizable symptoms which mark the disease.

Additional exhibits show the damage which venereal diseases do to the patient body, his mental processes, and his community. Visitors will learn that future control of these infections depends almost entirely on proper public appreciation and use of methods and drugs which are already available.

This exhibit is under the direction of Drs. Walter Dickie and Malcolm Merrill.

Heart Disease.—As number one killer in the United States, heart disease deserves and is given prominence in the medical section. Under the sponsorship of Ciba Pharmaceutical Products of Switzerland, a complete display is presented on the structure and function of the heart, and on the causes, diagnosis and relief of heart disease.

Featured in this exhibit are a five-foot transparent model of a constantly beating heart, an animated display showing the route of blood flow through the body, and the use of such diagnostic procedures as fluoroscopy, blood-pressure readings, and electrocardiography.

Other sections include informative material on the composition of the blood, the pump action of the heart, high blood pressure, and the use of chemicals in treating heart disease.

The exhibit is under the direction of Mr. A. Douglass Brewer of Ciba and Doctor Dock of the committee.

Tuberculosis.—Under the sponsorship of the California Tuberculosis Association, recent advances in the fight against the "white plague" are reported to the public.

Of most significance is the announcement that tuberculosis has now become most dangerous in the high school and college group. Recent investigations show a startling degree of infection in these students.

Cause of the disease, diagnosis by x-ray and skin test, and treatment by rest, sunshine, diet, and surgical collapse of the infected lung are explained in the exhibit. Particularly important to California is the section devoted to the control of bovine tuberculosis.

The exhibit is under the direction of Mr. Ford Higby of the Association and Doctors Brown and Meyer of the committee.

Pneumonia.—Since pneumonia is the chief cause of death among infectious diseases, the most exciting medical discovery in the past decade has been the development of effective antiserums for the control of every type of pneumonia germ.

Complete coverage of all the thirty-two types was completed only during the winter of 1938, and the Golden Gate International Exposition was selected for the first public or medical display of these almost miraculous materials.

The pneumonia exhibit, under the sponsorship of the Lederle Laboratories, shows the causative agents of pneumonia, the results of infection, the new methods of diagnosing and "typing" the microbes, and the administration of the proper type of antiserum. A special section is devoted to production and protection of these serums. Emphasis is placed on the necessity of proper and early medical care and of efficient nursing.

The exhibit is under the direction of R. S. Childs, vice-president of the sponsoring company, and Doctor Meyer of the committee.

Diabetes.—The story of insulin and its use to relieve diabetes is told by the Eli Lilly & Company exhibit. Charts, diagrams, and animated models explain the meaning of diabetes, the cause and hereditary factors, and the treatment.

Special displays indicate chemical diagnostic tests for diabetes, the relation between sex and the disease, and the importance of diet and exercise in controlling it. Three points are emphasized—the facts that insulin is a normal body secretion, that its use in diabetes is merely to make up for a deficiency, and that insulin is not habit forming.

The exhibit is under the direction of Drs. Raymond Rice of the sponsoring company and Clare Shepardson, representing the Advisory Committee.

Sex Hormones.—Modern discoveries in the chemistry of sex are combined in one of the most up-to-date exhibits in the Exposition. Sponsored by the Schering Corporation, this exhibit shows the rôle of hormones in controlling normal sexual development and sex characteristics.

Featured is the transparent "hormone woman"—an animated display which illustrates the interrelationships of female sex hormones during normal life, pregnancy, and the menopause.

A second feature is a striking comparison of the tremendous benefits resulting from chemical syntheses of these hormones and their production on a large scale.

This exhibit is under the direction of Edward Diekerhoff of the company and Drs. Kelly, Frederick Fluhmann, and Herbert Evans.

The Sterols.—During the past decade, research workers have given more and more attention to the group of chemi-

(Continued on Page 46)

A Business HYPODERMIC

THE revival of business is largely dependent upon forward-looking business men with faith and vision. Lack of confidence, reflected by curtailment of advertising and printed matter, is easily sensed by the buying public. Business men no longer can lay the onus to the consumer—it is up to them to lead the way.

Having determined that printed matter is a much needed Business Hypodermic, the buyer should check up his printing connections. There are only three general considerations to weigh in this regard: GOOD PRINTING — PROMPT DELIVERY — FAIR PRICES!

When these requirements are fulfilled, the buyer is getting SERVICE—the kind of service which has placed The James H. Barry Company among the leaders of the Printing Craft in San Francisco. This position has been attained by being constantly alert to the requirements of the buyers of printing for over a period of fifty years.

Although specializing in publication, book and catalog printing, we are daily producing some of the finest specimens of color printing in pamphlets, broadsides and folders.

Our customers are our best salesmen!

THE JAMES H. BARRY CO.

ESTABLISHED 1879

170 Van Ness Avenue South San Francisco

BUTLER BUILDING
GEARY AND STOCKTON STREETS — AT UNION SQUARE

"Our doctor in the East recommended you when he found we were coming to the Fair. We are simply delighted that you are practically around the corner from our hotel!"

Centrally located for guests from out of town, and just as convenient for "natives," the Butler Building is in the very heart of the downtown shopping and hotel district. Offices are light, airy, and comfortable.

Come to the building and see the offices for yourself, or call—

Call at building, or . . . .

151 SUTTER STREET, SAN FRANCISCO

(Continued from Page 44)

cals known as the sterols. These complex substances, it has now been found, include dozens of chemicals which are extremely potent and often valuable to living tissue.

In a display sponsored by the Sandoz Chemical Works of Switzerland, these sterols are explained in simple forms. Included are such sterols as vitamin D, the sex hormones, snake poisons, toad poisons, morphin and other opium alkaloids, cancer-producing substances, and drugs which act on the heart. Major emphasis is placed on this last group and particularly on digitalis and its chemical relatives.

This exhibit is under the direction of Prof. Dr. Arthur Stoll in Basle, Switzerland, and Dr. H. Althouse in San Francisco, representing the company, and Doctors Leake and Silverman of the committee.

Sanitation.—The importance of sanitation in modern civilization is dramatically portrayed in an exhibit sponsored by the West Disinfecting Company. The display shows how the proper use of chemicals can protect homes, buildings, and entire cities from infectious diseases.

In one section of the exhibit there is shown a cross-section of a modern American city, with arrows indicating the danger spots where epidemics can start.

In other sections the exhibit explains individual antiseptics and disinfectants, and emphasizes how their use can save lives by preventing diseases which are costly in both health and money.

This exhibit is under the direction of John Marcuse of the sponsoring company and Doctor Silverman of the committee.

Accident Prevention. — Two integrated exhibits are placed in the medical section to stimulate prevention of accidents with their resultant injuries and deaths.

In one, the Motor Vehicle Department of the State of California shows the terrible toll taken annually by highway accidents. Its goal is the education of Californians to realize the dangers of driving, and to recognize and properly meet dangerous highway situations. This exhibit is under the direction of Ray Ingels and William Ragan.

In the second safety exhibit, the Aetna Casualty Company presents a number of testing devices, "reactometers," which enable visitors to test their own reaction capabilities.

This exhibit is under the direction of Stanley Withe.

Medical Statistics.—Medical statistics, the score card of man's fight against death, are included as part of a display sponsored by the Metropolitan Life Insurance Company. Animated exhibits show the changes noted during the past decades in birth rates, death rates, and mortality rates of the chief causes of death. A second section in this exhibit is devoted to the importance of proper nursing in the home. This exhibit is under the direction of Dr. William Shepard.

Industrial Safety.—Under the sponsorship of the California State Industrial Accident Commission, a particularly timely exhibit will be seen by visitors. In this display each visitor has the opportunity to learn something of the hazards of his own industrial group.

Attention is pointed to the particular hazards involved in agriculture, in lumber mills, in steel mills, in paint shops, in mines, in business offices. Moreover, the exhibit not only shows what hazards exist, but also indicates how they can be overcome.

This exhibit is under the direction of Timothy Reardon.

Social Welfare.—During the past ten years, social welfare has become more and more closely related to clinical medicine. In a display sponsored by the California State Department of Social Welfare, this relationship is explained to the public. The exhibit shows how the State of California is attempting to solve health questions which have a background of social problems.

A related exhibit shows how the State of California institutions treat the physically and mentally ill.

University of California.—Financed by a special $300,000 grant from the State of California, and with the coöperation of a dozen nationally famous universities, research institutes and museums, the University of California is sponsoring the largest exhibit in the Hall of Science, and one of the largest in the entire Exposition.

Part of this great display is devoted entirely to medicine, and, in addition, considerable space is given to subjects

OUR FRIENDLY CHALLENGE

In your files are doubtless many Audiograms of patients who have not been able to obtain satisfaction from the application of a Hearing Aid—particularly persons with a severe nerve type of deafness. You are cordially invited to send these persons to us for a scientific fitting of the new

CRYSTALIC ACOUSTICON
With Thermionic (vacuum) Tubes

By pitting our instrument against your most difficult cases, we believe we can prove to you the truth of the statement that this "is the greatest advance in Hearing Aids for the past twenty years."

Consultation is private—and entails no charge or obligation. We will gladly prepare an Audiogram for any patient for whom you request such service—showing his hearing range *without* and also the increased range *with* the CRYSTALIC ACOUSTICON. Both graphs will be plotted on the same chart, so you can judge for yourself the improved and corrected hearing accomplished.

ACOUSTICON

705 Foreman Bldg. LOS ANGELES
457 Powell St. SAN FRANCISCO

Acousticon is accepted by the Council on Physical Therapy of the American Medical Association.

which are closely related to the battle against disease. In the section on general biology, visitors will find exhibits explaining the structure and function of the body, and the embryology of man and other mammals. In the section on chemistry and physics, there are displays on one of the outstanding scientific discoveries of the twentieth century—the atom-bombarding cyclotron, developed by Dr. E. O. Lawrence of the University. The new device, it is pointed out, is expected to have important medical applications—in regard to its production of cancer-destroying neutron-rays and to its production of cheap radio-active chemicals as substitutes for radium.

The medical section itself is marked by two exhibits which show the medical importance to man of the vegetable and animal kingdoms. These exhibits illustrate the plants and animals which cause or carry disease, and the plant and animal products which can fight disease.

Following these comes a series of exhibits on the "March of Life"—the progress of a human being from conception to death. In this series are placed exhibits on the care of children and the prevention of children's diseases, on the prevention and treatment of diseases of middle age, on pregnancy and childbirth, and on diseases of old age.

Coöperating with University of California scientists in developing this exhibit are workers at Stanford University, University of California at Los Angeles, University of Rochester, the Rosenwald Museum, the Buffalo Museum, Harvard University, and the University of Cambridge.

This exhibit is under the direction of Mr. William Norton and Drs. Jay Pearson, K. F. Meyer, and Guy Millberry.

Exposition Hospital.—Expert medical care and modern hospitalization is available for the welfare of the millions of visitors to Treasure Island. A fully equipped four-room hospital has been established in the Administration Building, and has two six-bed wards and two complete treatment rooms. A completely modern surgery, provided with all the latest necessary equipment, will be staffed at all times by physicians, internes, and nurses.

Ambulances and first-aid stations at various points will assist during emergencies.

The hospital, although closed to the public, will be open for examination at all times to members of the medical profession. It is under the direction of Dr. Morton Gibbons of San Francisco.

Advisory Committee.—In order to assure maximum efficiency in the use of funds, exhibit space, and time, all details of the medical section of the Hall of Science are under the control of an Advisory Committee on Medicine.

This group, composed of the topnotch medical leaders in the San Francisco Bay area, assumed full responsibility for the general plans and details of every exhibit and every lecture.

Chairman of the advisory group is Dr. Chauncey D. Leake, professor of pharmacology of the University of California Medical School, a world-famous research worker in medical fields and leader in medical education. Serving with Doctor Leake are the following:

Drs. Loren Chandler and Langley Porter, deans of the Stanford and University of California Medical Schools, respectively; J. C. Geiger and Paul Barrett of the San Francisco Department of Health; Walter Dickie of the California State Health Department; Francis Carmelia of the United States Public Health Service; K. F. Meyer, head of the Hooper Foundation for Medical Research, University of California; Guy Millberry, dean of the University of California Dental School; Walter Brown of the Stanford University department of hygiene; C. M. Haring, head of veterinary science at the University of California; Wilfred Robinson of the American Dental Association and John Leggett of the California State Dental Association; Nina Simmonds, nutrition expert of the University of California; William Dock, pathologist of Stanford University; Charles Gilman Hyde, sanitary engineer of the University of California; C. L. A. Schmidt, professor of biochemistry at the University of California and dean of the University's School of Pharmacy; T. Henshaw Kelly of the California Medical Association; William

Colfax School for the Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

Shepard of Metropolitan Life; and Mr. Walter Gnerich, secretary of the Northern California Retail Druggists' Association.

Director of the Hall of Science and secretary of the Advisory Committee on Medicine is Dr. Milton Silverman, research associate of the University of California and science writer for many magazines and metropolitan newspapers.

Most People Unknowingly Have Ulcers.—Most people, without knowing it, are constantly having ulcers of the stomach which naturally repair themselves, H. E. Robertson, M. D., Rochester, Minnesota, points out in his article, "Ulcerative Gastritis and Residual Lesions," in *The Journal of the American Medical Association* for January 7.

These ulcers are the result of hemorrhages from the minute vessels of the mucous membranes of the stomach. Such hemorrhages are the most frequent physiologic changes of this organ. These hemorrhages take place because of food and drink intemperances, poisons, local infections, fevers, anemias, and emotional disturbances.

In most instances, the cycle involves hemorrrhage followed by death of the affected tissue, that is promptly digested by the juices of the stomach, leaving an ulcer which usually is repaired naturally.

However, when complete healing does not take place a lesion remains which develops into chronic ulcer. The causes of such failure of the stomach to repair the ulcer are as yet not fully determined by medical science.

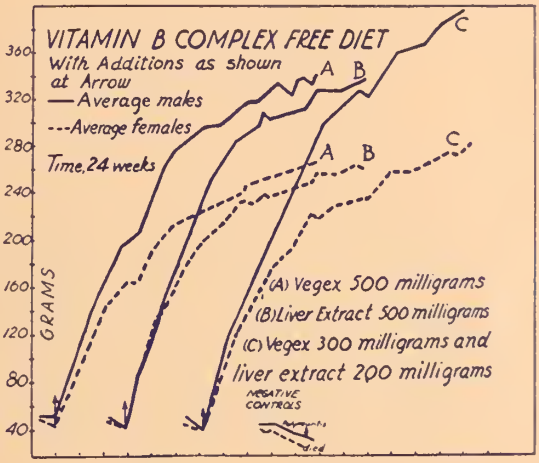
The author suggests that an insufficient amount of mucus at the hemorrhagic area may determine or retard healing of the ulcer. He also points out that the production of mucus may be under cerebral or emotional control.

Youth will never live to age unless they keep themselves in health with exercise, and in heart with joyfulness.—Sir P. Sidney.

VEGEX WITH LIVER EXTRACT

IN 1925, in a patent application, granted in 1930, the Laboratories of the Vitamin Food Company, Prince, recorded the discovery that the vitamins and endocrine extracts, particularly autolyzed yeast extract—Vegex—and liver substance—an extract—mutually supplement each other.

The chart shown here—Albino rat tests—confirms this. Vegex and a standard liver extract show well in the vitamin B complex, with special value when combined. In another series, with another liver extract, the results for eighteen weeks, are comparable to the chart shown here, and showing, further, that there is no appreciable difference between two parts Vegex and one part liver extract compared with one part Vegex and two parts liver extract.



In fifty-seven, independent, published reports from medical centers Vegex is shown high and regularly dependable in the extrinsic factor (anemias). Some of the workers, including Giglioli, Green-Armytage, Vaughan, Wills, Stewart and others, have observed favorable results when combining Vegex and liver extracts.

Green-Armytage (Ind. Med. Gaz., Penicious Anemia of Pregnancy, March, 1932), states:

> *"We have had excellent results with Vegex-Marmite given in 2 teaspoonful doses twice a day either in cold water or in soup. In a consecutive series of 50 cases I have no hesitation in stating that the clinical and pathological state of the patient greatly benefited as a result of Vegex-Marmite treatment."*

Vegex is a palatable, readily available and easily borne source of the vitamin B complex and the extrinsic factor, and economical for daily use by the patient. It gives a good flavor to liver diet. The value of the oral administration of Vegex, along with the intravenous use of the form of liver extract so used, or with the oral administration of liver extract seem worth while the physician's notice.

B VITAMIN COMPLEX
EXTRINSIC FACTOR

SPECIAL PURPOSE FOOD for the VITAMIN B COMPLEX (including antineuritic B_1; riboflavin B_2; antipellagric G; complete vitamin B complex growth factor); the EXTRINSIC FACTOR and available FOOD IRON.

●

INGREDIENTS

A brewers' yeast extract from a salt-enzyme autolyzing process—see analysis—with added pure vegetable flavor and added available iron salt—ferrous malate.

As used, a teaspoonful to a cup of liquid, the salt concentration is less than in toast. The vegetable flavor is of possibly no physiological significance. Meat like flavor, but entirely meat free. Starch and sugar free for restricted diets; easily borne by infants and patients on liquid diets.

VEGEX ANALYSIS

	Per Cent
Protein (N × 6.25)	32.6
Fat	0.8
Calories per ounce	40
Sodium Chloride	11.1
Phosphorus as P	2.62
Potassium as K	2.18
Calcium as Ca	0.098
Iron as Fe	0.048
Magnesium as Mg	0.13
Copper	0.00275
Manganese	Distinct Traces

B VITAMIN TEST

Average per Gram

Sherman-Chase B_1	45 units
International B_1	25 units
Sherman-Bourquin riboflavin	35 plus units
B Complex full growth	2 to 3 units

Mass clinical use indicates one man unit each anti-beriberi, anti-pellagric and extrinsic factor (anemias) per ounce.

●

Adequate nutrition requires the whole of the vitamin B complex. Vegex supplies it.

Good "Specifications"

CUTTER DIPHTHERIA TOXOID (Alum Precipitated)

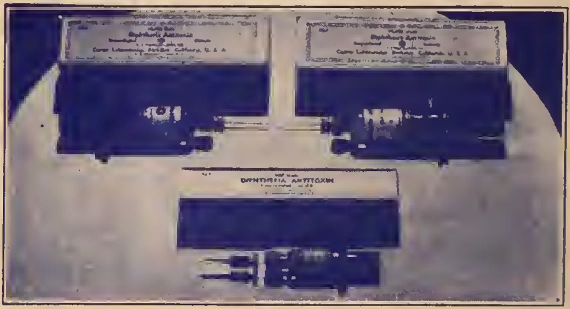
Recommended in public health work where cost is a deciding factor, or in rural districts where repeated injections are impractical. Full 1 c.c. Cutter dose prevents the reactions due to the greater concentration of alum in the ½ c.c. dose.

CUTTER DIPHTHERIA TOXOID (Regular)

Recommended for private practice or for public health work in urban areas where cost is not the deciding factor, as recent reports indicate a more rapid loss of immunity following the single dose of the alum precipitated product.

SMALLPOX VACCINE (Cutter)

Available in both regular and green dyed vaccine. Reaches your hands directly from Cutter refrigeration rooms, in a more potent condition than is possible with vaccine shipped across country.



DIPHTHERIA ANTITOXIN (Cutter)

Extremely concentrated antitoxin low in total solids—a concentrate that approximates, for all practical purposes, an almost pure solution of antibodies. In a smooth working syringe that comes to you ready to use.

SEMPLE RABIES VACCINE (Cutter)

Available in 7-dose packages, hence more economical, as treatment can be discontinued when the biting animal is shown non-rabid, without leaving useless doses on your hands. The full 1 c.c. dose avoids the sterile abscess formation which occasionally occurs when lower dilutions are used.

CUTTER PHASE I PERTUSSIS VACCINE (Concentrate)

Produced after the method of Madsen, as modified by Sauer, from cultures that are not only fresh but proven to be in Phase I, the immunilogical phase. Concentrated to 20 billion organisms per c.c. instead of the usual 10 billion, hence requires only a single injection at each visit.

Committee on Public Relations

The Committee on Public Relations consists of the chairmen of the following standing committees and of certain general officers of the Association, all serving ex officio. The chairman of the committee is George G. Reinle, the secretary is George H. Kress. The director of the Department of Public Relations is George H. Kress. The chairman of the Committee on Public Relations is ex officio a member of the Council.

Fred B. Clarke	Chair., Com. on Health and Public Instruction
W. Earl Mitchell	Chair., Com. on Hospitals, Dispensaries, Clinics
Philip Stephens	Chair., Com. on Industrial Practice
George G. Reinle	Chair., Com. on Medical Defense
George D. Maner	Chair., Com. on Membership and Organization
John H. Graves	Chair., Com. on Medical Economics
Junius B. Harris	Chair., Com. on Public Policy and Legislation
Alson R. Kilgore	Chair., Cancer Commission
John C. Ruddock	Chair., Com. on Postgraduate Activities
William W. Roblee	President of California Medical Association
Charles A. Dukes	President-elect
George H. Kress	Secretary-Treasurer

Communications for the Public Relations Department should be addressed to the Director, George H. Kress, M. D., Room 2004, 450 Sutter Street, San Francisco.

Cancer Commission

Alson R. Kilgore (Chairman)	San Francisco	1939
Henry J. Ullmann	Santa Barbara	1939
Clarence G. Toland	Los Angeles	1939
Charles A. Dukes	Oakland	1940
Lyell C. Kinney (Vice-Chairman)	San Diego	1940
Otto H. Pflueger (Secretary)	San Francisco	1940
Orville Meland (Sec'y for Southern Section)	Los Angeles	1941
A. Herman Zeiler	Los Angeles	1941
Gertrude Moore	Oakland	1941

Communications for the Cancer Commission should be addressed to the Secretary, Otto H. Pflueger, M. D., Room 2004, 450 Sutter Street, San Francisco.

(Roster lists of officers of scientific section, component county societies, Woman's Auxiliary, A. M. A. delegates, special committees, etc., are continued on advertising pages 4 and 6.)

Decholin
REG. U.S. PAT. OFF.

A True Choleretic
●
A Single Chemical Entity
●
Virtually Nontoxic

For Promptly Induced and Sustained BILIARY DRAINAGE

In biliary tract disturbances, when prompt, free drainage of the entire biliary tree is the primary aim of therapy, the combined use of Decholin tablets (dehydrocholic acid) and Decholin sodium is indicated. Decholin sodium intravenously (3 cc. to 10 cc. daily for 2 or 3 days) promptly initiates the desired intensified bile secretion; Decholin orally (one or two 3¾ gr. tablets t.i.d.) thereafter maintains the flow.

Decholin and Decholin sodium are of established value in chronic cholecystitis, noncalculous cholangitis, hepatitis of toxic origin, biliary insufficiency, biliary engorgement, and pre- and postoperatively in biliary tract surgery. There is only one contraindication: complete obstruction of the hepatic or the common duct.

ACCEPTED
AMERICAN MEDICAL ASSN

Riedel-de Haen, Inc.
105 Hudson Street New York, N. Y.

What Is Life?—What is Life? You answer, I do not think—I act it; the only philosophy that brings you in contact with its real values and enables you to grasp its hidden meaning. Over the Slough of Despond, past Doubting Castle and Giant Despair, with this talisman you may reach the Delectable Mountains, and those Shepherds of the Mind—knowledge, experience, watchful and sincere. Some of you may think this to be a miserable Epicurean doctrine—no better than that so sweetly sung by Horace:

> Happy the man—and happy he alone,
> He who can call today his own,
> He who secure within can say,
> Tomorrow, do thy worst—for I have lived today.

I do not care what you think, I am simply giving you a philosophy of life that I have found helpful in my work, useful in my play. Walt Whitman, whose physician I was for some years, never spoke to me much of his poems, though occasionally he would make a quotation; but I remember late one summer afternoon, as we sat in the window of his little house in Camden, there passed a group of workmen whom he greeted in his usual friendly way. And then he said: "Ah, the glory of the day's work, whether with hand or brain! I have tried

> To exalt the present and the real
> To teach the average man the glory of his daily work or trade."

In this way of life each one of you may learn to drive the straight furrow and so come to the true measure of a man.—William Osler, M. D., 1913.

The art of living well! Of living abundantly! Two are done quickly with life—the fool, and the dissolute. The one because he does not know how to keep it, and the other because he does not care. As virtue is its own reward, so is vice its own punishment; for he who lives too fast is quickly through and, in a double sense, while he who rests in virtue never dies. For the life of the spirit becomes the life of the body, and the life lived well gathers unto itself not only fullness of days, but even length.—Baltazar Gracian, 1653.

ISOPHRIN
TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is ¼% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel's.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

THE TEST OF TIME

STANDARD SIZE CONTAINS 18 FLUID OUNCES

MALTINE WITH COD LIVER OIL was first presented to the medical profession 64 years ago. A tribute to its reliability is the fact that during all these years it has been prescribed with confidence. It combines the well-known virtues of pure, natural cod liver oil with those of a standardized medicinal malt extract.

MALTINE WITH COD LIVER OIL, packed in a generous 18-fluid-ounce bottle, has none of the unpleasant taste of the usual vitamin-bearing oils. The Maltine Company, 21 West Street, New York City.

ACCEPTED AMERICAN MEDICAL ASSN. Council on Pharmacy and Chemistry

Sulfanilamid.—Sulfanilamid has scored sufficiently notable recent successes against some fourteen serious diseases or conditions to make the drug and its derivatives current claimants for high medical honors. Recent research has helped to dissipate fears of the drug that developed more than a year ago after a number of fatalities caused by a poisonous solvent with which one manufacturer combined it.

Manifestly, sulfanilamid is not a drug to be purchased by the self-prescriber and used without benefit of competent medical supervision. In fact, the story of sulfanilamid and its conquests is not complete without warnings of its potential dangers.

This has led Dr. Sanford M. Rosenthal, Senior Pharmacologist of the United States Public Health Service, to report a recent study of the drug in *Public Health Reports* of January 27, 1939.

"There is definitely a relation," said Doctor Rosenthal, "between diet and toxicity of the drug and its derivatives which scientists must consider in their future studies, although its explanation is yet unknown."

Previously noted had been the occurrence of peripheral neuritis in human beings following the use of the derivative "di-sulfanilamid," emaciation and motor weakness in pigeons following oral administration of the methyl derivatives of this compound. Mice and rats were found to possess a low toxicity; guinea pigs to show cumulative effects.

The present study was made to investigate the problem of these cumulative and delayed effects following repeated doses of both the parent drug and its compound. Two sets of experiments were carried out: one, with rabbits, to determine the effects of diet on toxicity; another, with hens, ultimately, "to produce an animal counterpart of the specificity of action" similar to polyneuritis in man. All drugs used in the tests were given orally in varying doses; diet for rabbits consisted of either oats or cabbage alone or both, and for hens, a standard commercial chicken feed.

The results showed that sulfanilamid possesses a cumulative toxicity in rabbits. Repeated administration led to nervous symptoms, weakness, emaciation, and a considerable mortality.

The influence of diet was shown in that a dosage of the drug, which was tolerated by rabbits on a cabbage diet, caused a high percentage of deaths in those animals on a diet of oats plus cabbage, or oats alone.

Daily administration of sulfanilamid to hens produced neuromuscular weakness and emaciation. Death frequently occurred and was often delayed for one to four weeks subsequent to treatment. The appearance of many of these hens, according to Doctor Rosenthal, "suggested peripheral neuritis, but in many animals it was not possible to establish this condition on a pathological basis."

Repeated daily doses of the compound, di-sulfanilamid, also produced cumulative and delayed toxic effects, both to rabbits and chickens. The drug was somewhat less toxic than sulfanilamid, the studies reveal; and results in rabbits also differed in that no differences in mortality were observed in the animals on oat and cabbage diets.

The results of these studies, according to the author, but again emphasize the need for the use of several species of animals kept under controlled conditions in similar research.

"Most important point yet to be determined," concluded Doctor Rosenthal, "is the extent to which cumulative toxicity of the drug occurs in man, particularly under those conditions often present during therapy—restriction of diet and toxemia. In man, the usual toxicity symptoms differ again from those seen in animals: therefore, the delayed toxic effects from sulfanilamid as seen in chickens must be given no clinical implications. This, because of the relatively large doses administered in these experiments, and because similar effects so rarely occur in man following its use."

There is still an immense amount to be learned about health, but if what is at present known to a few were part of the general knowledge, the average expectation of life could probably be increased by about ten years.—J. B. S. Haldane.

Golden Gate International Exposition, Treasure Island in San Francisco Bay.—Treasure Island, new man-made World's Fair and airport island in San Francisco Bay, moved actively into both phases of its career during the California "winter" just past.

On February 18 the $50,000,000 Golden Gate International Exposition swung wide its Portals of the Pacific for 20,000,000 anticipated visitors before it closes on December 2, 1939.

Just a few weeks earlier, Pan-American Airways moved its transpacific base to Treasure Island; received the China Clipper there after a scheduled flight from Hongkong, and took delivery of the first of the huge 74-passenger Boeing Clippers—largest flying boats in the world—which will operate regularly from Treasure Island during the Western World's Fair.

The China Clippers, landing and taking off in sight of Exposition visitors and receiving terminal overhaul behind glass walls, are one of the foremost "exhibits" on Treasure Island. Other exhibitors include more than three hundred outstanding American industries, representing every field of activity and interest.

Thirty foreign nations, most of them in pavilions of distinctive racial architecture, lend atmosphere to the four hundred acres of the Western World's Fair. Fourteen states, a cross-section of carnival gaiety in the forty-acre Gayway, a history-making collection of Old Masters, contemporary and decorative arts, and outstanding demonstrations of scientific marvels are other features of the compact Pageant of the Pacific.

Its buildings are of two sorts: a mystic, lovely "Pacific" architecture for the romanticists, blending ancient Mayan, Incan, and Cambodian forms into new beauty; and another section of streamlined modernistic structures, separated from the others by lagoons, for tastes which reach boldly forward.

Both groups are framed within a lavish California garden setting which cost $1,500,000, and glorified at night by illumination which makes wide use, at a cost exceeding $1,000,000, of the new "fluorescent tube" for unimagined beauty in colored floodlighting. Sculptures, murals, abound.

Scorning mere size, the West's World's Fair—squarely between the world's two greatest bridges—has gone in for beauty, for fun, for relaxation from the cares of every day. It is the focal point for a year of merrymaking between the Continental Divide and the Pacific Ocean, and the world is invited to "Be the Guest of the West in '39."

Like a great white wedding cake, Treasure Island rises from blue San Francisco Bay and looks westward through the Golden Gate—a Shangri-La, a Never-Never Land where any dream may come true, and pleasure beckons.

The load of tomorrow added to that of yesterday, carried today, makes the strongest falter. Shut off the future as tightly as the past. No dreams, no visions, no delicious fantasies, no castles in the air, with which, as the old song so truly says, "hearts are broken, heads are turned." To youth, we are told, belongs the future, but the wretched tomorrow that so plagues some of us has no certainty, except through today. Who can tell what a day may bring forth? Though its uncertainty is a proverb, a man may carry its secret in the hollow of his hand. Make a pilgrimage to Hades with Ulysses, draw the magic circle, perform the rites, and then ask Tiresias the question. I have had the answer from his own lips. The future is today—there is no tomorrow! The day of a man's salvation is now—the life of the present, of today, lived earnestly, intently, without a forward-looking thought, is the only insurance for the future.—William Osler, M. D., 1913.

Let him who knows little, play safe, whatever his job, and even though he be not adjudged smart, he will be adjudged sound. He who knows much may take a chance, and let his imagination roam; but he who knows little, and takes chances, voluntarily tries suicide; keep always to the right, for what is established as right cannot be wrong; the king's highway is fixed for the simpleton, and this law for everybody, know he much, or know he little, that there is better sense in safety than in singularity.—Baltazar Gracian, 1653.

COÖPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY — FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

THE NEW YORK POLYCLINIC
MEDICAL SCHOOL AND HOSPITAL
(Organized 1881)
(The Pioneer Post-Graduate Medical Institution in America)

For the General Surgeon

A combined surgical course comprising General Surgery, Traumatic Surgery, Abdominal Surgery, Gastro-Enterology, Proctology, Gynecological Surgery, Urological Surgery, Thoracic Surgery, Pathology, Roentgenology, Physical Therapy, Operative Surgery and Operative Gynecology on the Cadaver.

Roentgenology

An intensive course devoted to lectures and demonstrations on film interpretation, fluoroscopy and technique. The department is open daily from 9 a. m. to 5 p. m. Matriculants are extended the opportunity to attend in the department during radiographic and fluoroscopic examinations.

National Institute of Health. — The United States Treasury Department announces that construction will be started immediately on two additional laboratory buildings and living quarters for fourteen of the medical officers and their families at the National Institute of Health near Bethesda, Maryland.

With the completion of these two new laboratory buildings and the National Cancer Institute Building, which was started last November, Doctor Thompson said that facilities will be available at the Bethesda center for about six hundred scientific investigators, laboratory technicians, and research workers. The Institute is concerned with many public health problems, ranging all the way from the control of serums and vaccines to determining the number of hours which bus and truck drivers can work without suffering undue fatigue which endangers life on the highways.

One of the new laboratory buildings will house the Divisions of Infectious Diseases, and Biologics Control. The other will be used by the Divisions of Chemistry, Pharmacology, and Zoölogy. The buildings are being erected on the original plot of forty-five acres of land fronting on the Rockville Pike near Bethesda, which was given to the National Institute of Health in 1935 by the late Luke I. Wilson and Mrs. Wilson. Subsequent deeds by Mrs. Wilson in 1937 and 1938 have increased the grounds to about sixty acres. Her latest gift includes the land which will be used for the officers' quarters and the National Cancer Institute building. It is expected that the Cancer Institute will be completed early in July of this year, and the laboratories at Cambridge, Massachusetts, and in the Institute buildings at Twenty-fifth and E streets will be moved into the new building at that time.

The two new laboratory buildings, which are also scheduled for completion by the spring of 1940, will be 50 feet wide and 250 feet long, and each will contain three floors, two basements, and an attic. All the space in the buildings will be devoted to laboratories and scientific equipment.

Cook County Graduate School of Medicine
(IN AFFILIATION WITH COOK COUNTY HOSPITAL)
Incorporated not for profit
Announces Continuous Courses

MEDICINE—Two Weeks Course, June 5 and October 9. Two Weeks Gastroenterology, June 19 and September 25. Personal Courses every week.
SURGERY—General Courses One, Two, Three and Six Months; Two Weeks Intensive Course in Surgical Technique with practice on living tissue; Clinical Courses; Special Courses. Courses start every two weeks.
GYNECOLOGY—Two Weeks Course, June 5 and October 9. Personal Course, Vaginal Approach to Pelvic Surgery, April 10 and November 6. Two Weeks Personal Course, June 19.

CYSTOSCOPY—Ten Day Practical Course rotary every two weeks.
General, Intensive and Special Courses in all branches of Medicine, Surgery, and the Specialties every week.

●

TEACHING FACULTY — ATTENDING STAFF OF COOK COUNTY HOSPITAL
Address: Registrar, 427 South Honore Street, Chicago, Ill.

The officers' quarters will consist of two detached houses and six semi-detached dwellings. The entrance will be from Cedar Lane, and the buildings will be arranged in semi-circular fashion with an attractive flagstone walk between them. It is expected that these dwellings will be ready for occupancy by April 1, 1940.

The living quarters at the Institute will be occupied by the director and assistant director and by other medical officers who may be stationed at the Institute from time to time. The officers are required to pay rent. Construction costs for these buildings will be amortized over a sixteen-year period.

Look to your health; and if you have it, praise God and value it next to a good conscience; for health is the second blessing that we mortals are capable of—a blessing that money cannot buy; therefore value it, and be thankful for it.—Izaak Walton.

Half of Low Salary City Diets Below Standard, Survey Shows.—From the standpoint of nutrition, 40 to 60 per cent of family diets of white employed city workers appear to be in need of improvement and the same is true for about 60 per cent of the diets for negro families.

This finding is from an analysis by Dr. Hazel K. Stiebeling and Esther F. Phipard of the Federal Bureau of Home Economics from a study of more than 4,000 dietary records obtained in 1934-1937 from families of employed wage-earners and low-salaried clerical workers in cities in eight major geographical regions. Complete details of the study are available in Circular 507, just published by the United States Department of Agriculture.

At every expenditure level above a certain minimum, Doctor Stiebeling points out, some families succeeded in obtaining good diets, but others provided themselves with a diet only fair or poor from a standpoint of nutritive value. For example, with an average food expenditure of $2.50 a person a week, which is higher than the median in all areas, 32 per cent of the families in the East South Central area bought good diets, while another 37 per cent obtained diets that were classed as poor.

The cost of buying diets with a wide enough margin of safety in protein, minerals, and vitamins to be rated good varied somewhat from one region to another. This study found the minimum expenditure for diets with this wide margin of safety to range from about $1.90 a person a week for negro families in the South to about $2.75 a person a week for white families in North Atlantic cities.

Based on recent studies made in the Bureau, the study reveals that about one-third of the white families obtained diets high enough in vitamin A to insure good visual adaptation in semidarkness. The diets of only one-fifth of the families insured a liberal allowance of vitamin A.

The pellagra-preventive factor appears amply supplied except in the Southeast, where the deficiency in low-income groups is serious. Here it was found that not enough was spent for fresh vegetables, milk, and cheese.

For a good diet it has been suggested that as much of the food budget be spent for milk and cheese, and also for fruits and vegetables, as for eggs, lean meat, poultry and fish. The study showed that white families spent from one-fourth to one-third of their food money for eggs, lean meat, poultry and fish; from one-fifth to one-fourth for vegetables and fruits, and only one-eighth to one-sixth for milk and cheese. Negro families spent almost one-third for eggs, lean meat, poultry, and fish; about one-sixth for vegetables and fruits, and only 6 per cent for milk.

Usual diets of these families included fewer eggs, less than two-thirds as many vegetables and fruits, and from one-half to one-third as much milk as diets graded as good. Doctor Stiebeling suggests that many present-day diets may be improved considerably in nutritive value not by spending more, but by spending more wisely.

The family records were gathered by the Cost of Living Division of the Bureau of Labor Statistics and the analysis of content, cost, and nutritive adequacy of diets was made by the Bureau of Home Economics in coöperation with the Works Progress Administration. Only nonrelief families with incomes of at least $500, but not more than $2,000 or more than $200 for any one month, during the preceding year were included in the study. The group possibly represents a higher economic level than characterizes city wage-earners as a whole, in the opinion of Doctor Stiebeling.

H. M. Swartz Now With the Baker Laboratories of Cleveland.—H. Mabry Swartz, wishes to announce that he has taken over the West Coast distribution of the Baker Laboratories of Cleveland, manufacturers of high-grade infant diet products.

Baker's infant diet products have been available in the East since 1930; are ethically advertised and distributed; have the approval of the Council of the American Medical Association.

Depression or No Depression. — Since 1930, month after month, a unique series of educational-to-the-public advertisements have appeared on the first page of *Hygeia.* The sponsor's name, Mead Johnson & Company, has to be looked for with a magnifying glass, and appears only for copyright purposes. Not a product is ballyhooed. Instead, appears good, clean, convincing reasons, with choice illustrations, why mothers should seek pediatric advice from their physician.

Total Number of Blind Persons in the United States. There are at least 117,000 totally blind persons in the United States, according to estimates of the National Health Survey which were recently made public by the United States Public Health Service.

In presenting this figure, George St. John Perrott, director of the survey, stated that blindness, which already constitutes a major problem in society, will be likely to increase because older persons, among whom blindness is more prevalent, are constituting a larger and larger proportion of the population. One-fourth of the blind are over seventy-five years of age and three-fifths are over fifty-five.

Cataract, glaucoma, trachoma, optic-nerve atrophy and other eye diseases coupled with more general diseases such as high blood pressure, hardening of the arteries and diabetes, are responsible for nearly three-fourths of all blindness. The rest is attributed to accidents (about 21 per cent) and congenital or early infancy causes (approximately 7 per cent).

Among the accidents causing blindness—which account for about one-fifth of the entire amount—the largest single cause is falls (16 per cent); next in order come automobile accidents and burns (each 10 per cent); and poisonings and firearms (each 7 per cent); the remaining 50 per cent is distributed over a large number of known and unknown types of accidents. Forty-three per cent of these accidents are classified as occupational injuries, those occurring at work; 27 per cent occurred in the home and 30 per cent in public places, including automobile accidents.

The report pointed out that blind persons are concentrated in the low-income groups. Seventy per cent were found to be in families with annual incomes of less than $1,000.

The prevalence of blindness among men is greater than among women, according to Survey findings. For every 100 blind women there are 111 men afflicted with blindness. Among youths (15 to 24 years), the prevalence rate for males is 20 per 100,000, while the female rate is only 9 per 100,000. Figures for the younger working ages (25 to 44) show a prevalence of 144 blind per 100,000 men, while the rate for women is only 28. In the oldest age grouping (65 and over), however, the rate is 706 per 100,000 women to 660 per 100,000 men.

The Survey found nearly twice as much blindness among colored people as among whites in proportion to their numbers. The rate of blindness for colored persons is 146 per 100,000 as contrasted with 75 for the white population.

Only 11 per cent of the blind were reported as being employed in gainful occupations, leaving the greater number dependent upon private or public support.

This study of the National Health Survey was primarily concerned with total blindness, which included "all persons reported by the family as being blind in both eyes." In connection with the study, however, figures for blindness in only one eye were compiled and it was estimated that "in the general population there were about 425,000 persons blind in one eye only," as against 117,000 persons blind in both eyes.

The National Health Survey was a project conducted by the United States Public Health Service with the aid of financial grants from the Works Progress Administration. The results are based on a house-to-house canvass of some 800,000 families, including 2,800,000 persons in eighty-three cities and twenty-three rural areas in nineteen states. The Survey was made during the winter (largely from November to March) of 1935-1936.

The total surveyed population was so distributed as to give a sample which was, in general, representative of cities in the United States according to size and region. In large cities (100,000 and over) the population to be canvassed was determined by a random selection of many small districts based on those used in the United States Decennial Census of 1930. In the smaller cities selected for the study, the population was enumerated completely.

Assure for your patients the *quality* of medicinal agents made possible by seventy-three years of scientific research and manufacturing experience

GENERAL OPERATIVE SURGERY

A Continuous Course » Will Start April 6, 1939

SUBJECTS COVERED—The principal operations of general surgery will be included. The work will consist of the surgery of the stomach and gall-bladder, intestines and colon, urogenital organs, hernias, goiter, amputation of the breast, bone and tendon surgery, amputations, etc.

METHOD OF INSTRUCTION—Every part of the course will be preceded by a thorough foundation of the anatomy. This will consist of lectures, demonstrations and dissections. The principal operations will then be described by the instructors and performed by the students on fresh human material. Opportunity will be given to have demonstrations on the living.

MINOR SURGERY—Opportunity will be given to perform minor operations such as injections of varicose veins and hernia, blood transfusions, spinal and local anesthesia, injection of hemorrhoids, fissures and fistulas, repair and amputation of cervix, perineorrhaphy, hydrocele, varicocele, minor operations on nose, removal of tonsils (local and general).

CLINICAL WORK—Pelvic and rectal examinations, study of the optic disc and ear drum, paracentesis, cystoscopy.

HOURS, ETC.—The work will be done on Thursdays from 11 a. m. to 2 p. m.

The fee will be $15 per month

Applicants must be graduates of schools approved by the State Board of Medical Examiners

For descriptive circular and further information inquire of

SAN FRANCISCO POLYCLINIC AND POSTGRADUATE COLLEGE, or

BOOK REVIEWS

Modern Surgical Technic. By Max Thorek, M.D., K.L.H., K. C., Professor, Clinical Surgery, Cook County Graduate School of Medicine, Chicago. With a foreword by Donald C. Balfour, M. B., M. D., LL. D., Head of Section in Division of Surgery, The Mayo Clinic, Rochester, Minnesota. Complete in three volumes. Volume I: General Operative Considerations; Surgery of the Head and Neck, and Plastic Surgery. Volume II: Surgery of Nerves, Vessels, Bones; Surgery of Breast and Chest. Volume III: Abdominal Surgery, Hernia, Genito-Urinary and Gynecologic Surgery. Cloth. Price, $33 per set. Pp. 526; 527-1229; 1231-2045, with 2,174 illustrations, originals principally by W. C. Shepard. Philadelphia, New York, Montreal, and London: J. B. Lippincott Company, 1938.

This work consists of three volumes of well-illustrated surgical technique, so written as to be concise, but still explain the different procedures in a way that can be understood by a surgeon who is trained in general surgical principles but not especially experienced in the particular operation in question. The general plan of the work is to give a brief discussion of the problem and then a step by step description of the operation. Whenever possible, more than one method of performing each operation is given. Two thousand one hundred seventy-four illustrations and diagrams help the reader picture the steps as they are described. This work is not merely a description of the author's technique, but a description of operations devised by others which the author feels are most valuable to the reader.

Volume I presents the general operative considerations and covers the surgery of the head and neck and plastic surgery. Preoperative preparation and the commoner postoperative sequelae, both immediate and late, are adequately discussed. The arrangement and equipment in an operating room, together with operating-room technique receives special attention. This includes a discussion of the various methods of sterilization. The author devotes nearly fifty pages to anesthesia. This section is well illustrated, and presents apparatus, methods and technique, indications and contraindications for general, regional and local anesthesia, describing in detail, spinal anesthesia,

CALSO Water with SULFANILAMIDE

It has been observed that low concentrations of sulfanilamide appear to be bactericidal in infections of the genito-urinary tract if the urine is maintained at a pH of approximately 7.4.

May we suggest the use of CALSO before sulfanilamide administration to establish the desired urinary pH.

During sulfanilamide administration to maintain urinary pH and to offset possibility of supervening acidosis.

After sulfanilamide therapy to promote diuresis and assist in elimination of any residual drug.

CALSO is not a laxative and contains no sulphate

BOOK REVIEWS

(Continued from Preceding Page)

sacral and parasacral, paravertebral and splanchnic anesthesia. The author conforms to the method of presenting this technique used throughout his three volumes. Each step is given precisely and in detail and in proper sequence.

Operations on the head and neck are grouped according to structural regions and cover the ordinary operative procedures of the eye, ear, nose, and throat, as well as the surgical problems of the scalp, skull, brain, mouth, and neck. In many instances, two or more operative procedures for the same condition are described and illustrated in detail. Operations for injuries and diseases of the mandible are particularly well presented. An excellent chapter on the principles of plastic surgery and skin grafting, illustrated by drawings, diagrams and photographs, concludes Volume I.

Volume II is given over to descriptions of the surgery of nerves, vessels and bones, and in its second part to surgery of the breast and chest. In the section on surgery of the nerves, a discussion is given of the general principles involved in neurolysis, capsulectomy and methods of nerve sutures with many diagrams. Following this discussion, specific operations are given in detail. A rather large section is devoted to surgery of the sympathetic system, giving well-illustrated descriptions of most of the important operations.

One hundred pages are devoted to surgery of the vascular system. The technique of arteriorrhaphy is discussed in detail, giving various methods of suture. A large part of the text is devoted to ligation of vessels at specific points. Here the landmarks for localizing the incisions are given, and how and where to tie the vessels is told. Some twenty pages are given to discussion and operative technique in aneurysm in general and in specific localities. Treatment of varices is briefly but sufficiently discussed, as is transfusion and surgery of the lymphatic system.

Orthopedic surgery is described in about three hundred and fifty pages, the first third describing various open operations, the remainder amputation, fracture, and dislocation. Surgery of the breast is well described, naturally devoting most of the space to radical mastectomy, although a fair amount of space is given to plastic operations. The radical operation is fully described. Several incisions are given, the rest of the operation given by steps. The author favors the use of the radio knife and presents a series of excellent illustrations.

The final one hundred and fifty pages are devoted to thoracic surgery, including the so-called basic operations on the thorax, such as rib resection, wounds of the lung, thoracoplasty, operation for empyema, etc. Lobectomy is described in considerable detail. Two techniques are given for pulmonary embolectomy and a few pages are given to surgery of the mediastinum and the heart, including suture of heart wounds and Beck's operation to increase the blood supply to the heart muscle.

Volume III discusses surgery of the abdomen and pelvis. An adequate amount of space is devoted to the opening and closing of the abdomen, giving the various incisions and techniques for closing. Surgery of the stomach, amply illustrated, is described in the next one hundred pages, giving several methods for most of the lesions described. The author then takes up surgery of the intestines, in which he gives various methods of enterostomy, colostomy and resections, including those of the large and small bowel, appendix, etc. Next the author describes a series of rectal operations. A chapter is devoted to operations on the liver and biliary passages, and another one each to surgery of the pancreas and the spleen.

A fairly long chapter is devoted to the repair of various types of hernia. A very clearly described and illustrated discussion is given of several different operations for the common hernias, and an excellent discussion on diaphragmatic hernia. One hundred and twenty pages are given to gynecological surgery, in which most of the necessary operations are clearly described. In the final two hundred pages the author describes the operations on the genito-urinary organs, such as operations on the kidney, transplantation of ureters, operations on the bladder and plastic operations on the genitals. L. R. C. and E. L. R.

Manual of Psychiatry. By Aaron J. Rosanoff, M. D. Seventh edition. New York: John Wiley & Sons, Inc.; London: Chapman & Hall, Ltd., 1938.

Rosanoff's "Manual of Psychiatry and Mental Hygiene" should be read by psychiatrists and students of psychiatry, if for no other reason, because it differs so greatly from

You *CAN* Take It With You

HERE'S a portable x-ray unit that is powerful, efficient, and unusually compact. It is so light in weight that you can easily take it with you on your calls. It's the G-E Model F-3, a unit you can rely on for satisfactory, dependable x-ray performance within its range – in your office or at the patient's bedside – wherever adequate roentgenological service is not already available. The simplified, refined control unit of the F-3 is easy-to-operate, requires no complicated manipulation; and the unit's full flexibility expedites and simplifies positioning with minimum patient discomfort.

Think what a valuable assistant this fine unit would be! It's easy to own, too. As a matter of fact, its total cost is surprisingly low and requires an initial investment of no more than is necessary for an ordinary small x-ray unit.

So that you may decide for yourself the worth of the F-3 to you in your practice, and its merit as a dependable, economic investment, let us arrange an interesting working demonstration in your office at your convenience. Then you can actually use and operate the unit just as you would in your daily practice; to do this will cost you nothing and incur you no obligation. Just sign and mail the handy coupon today.

Helium-Oxygen Mixtures Used in Treatment of Asthma

The general effect of a mixture of helium with oxygen (usually 80% helium, 20% oxygen) is to increase the permeability of the gas, enabling it to pass through the alveoli and relieve congestion. Helium-Oxygen also has a tendency to reëstablish sensitivity to epinephrine.

We are furnishing these mixtures of Helium and Oxygen, prepared with our customary exacting care; and also the proper equipment to use them. For clinical data and other information, address us at 211 Bay Street, San Francisco.

BOOK REVIEWS

(Continued from Page 16)

the usual textbook on psychiatry. That the readers may not agree with the author in a number of particulars, may be expected. The fact that he does not conform completely to the usual, in itself constitutes good reason for reading his book. From the French "Manuel de Psychiatrie" by J. Rogues de Fursac, published in 1902 and translated by Rosanoff in 1905, to the present edition of the Manual, there has transpired not only a period of thirty-three years but also an almost complete metamorphosis of the content. Eventually, the author has extensively set forth his own views of psychiatry and related subjects, with due mention of various views of others, in a book of 1,091 pages.

In Part I, General Psychiatry, are separate chapters on Etiology; Symptomatology; Neuropsychiatric Syndromes; and General Pathology of Mental Disorders.

In Part II, Special Psychiatry, are chapters on Classification; Huntington's Chorea; Amaurotic Family Idiocy; Hereditary Mental Deficiency; Mongolism; Cerebral Birth Trauma; Postnatal Birth Trauma; the Meningitides and Encephalitides; Neurosyphilis; Alcoholism; Drug Addictions; Other Exogenous Toxins; Autotoxic Psychoses; Endocrine Disorders; Nutritional Deficiencies; Intracranial Tumors; Cerebral Arteriosclerosis; Senile and Presenile Deteriorations.

Thus far one finds familiar presentations of the subjects, at times meager, but with lengthy case histories and much statistical detail. But now the reader arrives at a chapter, entitled "Chaotic Sexuality, Including So-Called Schizophrenic Psychoses," and finds a "breaking up of what was once thought to be a pathologic entity," with case histories dealing particularly with homosexuality. This is followed by a chapter on Affective-Reaction Groups, Including So-Called Manic-Depressive Psychoses. The remaining chapters concern Antisocial Personalities; Mixed, Transitional, Borderline and Miscellaneous Groups; and A Theory of Temperament, Based Mainly on Psychiatric Experience.

Part III, The Practice of Psychiatry, includes Methods of Investigation; Therapeutic Techniques; Psychoanalysis; Medico-Legal Questions; Military and Industrial Psychiatry. In his chapter on Psychoanalysis, the author quotes extensively from Freud's writings. The subject matter is, accordingly, fairly stated, but the reader may find it bewildering, particularly if he lacks previous comprehensive knowledge of this special method of psychotherapy.

In Part IV, one finds very interesting interpretations of mental hygiene. In Part V are set forth in detail various special diagnostic procedures. In Part VI appear the official classification of mental disorders; tables of height and weight; tables of intelligence quotients; and, finally, a glossary of index of subjects and authors.

The author wishes to provide the student with a "working manual." He does not attempt completeness of all presentations, yet provides a considerable amount of statistical analysis. He does not regard the Manual to be a source book, yet each chapter is terminated with an extensive bibliography. The book should stimulate individual thinking and investigation.

One may not be in accord with the author's elimination of schizophrenic psychoses as an entity and their inclusion in a chapter entitled "Chaotic Sexuality," but it is well to learn his reasons for doing so. One may regard it an improper step to eliminate the psychoneuroses as a clinical group and to find so little organized discussion of their clinical types. Some may agree with the close identification of hysteria and malingering; others will object vociferously to the same. Probably no one will be completely satisfied with the Manual, yet each reader should find food for thought. Certainly, the author is sincere and careful in his statements, and from time to time one is particularly impressed by the excellence of his descriptive language.

Petrolagar Plain

AN ADJUNCT TO THE RESTRICTED DIET

During a period of restricted diet, bowel regularity may be maintained with the aid of Petrolagar Plain. As an adjunct to the diet, Petrolagar induces a soft, well-formed stool and encourages a regular habit time for bowel movement.

If the case is severe, Petrolagar Plain may be given in alternate doses with Petrolagar with Cascara until proper elimination is established. Then Petrolagar Plain alone will assist in maintaining a regular, comfortable movement.

Petrolagar is issued in five types to suit the individual case.

Petrolagar—Liquid petrolatum 65 cc. emulsified with 0.4 Gm. agar in a menstruum to make 100 cc.

Petrolagar

Petrolagar Laboratories Inc. • 8134 McCormick Boulevard • Chicago, Illinois

Every Product Exhaustively **TESTED!**

Physicians must have preparations the ingredients and efficacy of which are of unquestioned value. The steady growth of The Smith-Dorsey Company from 1908 is the best indication that our products measure up to these requirements.

PHARMACEUTICALS
YOU CAN PRESCRIBE WITH
CONFIDENCE

Every Smith-Dorsey product is safeguarded in three ways:

1. We operate a control laboratory for the purpose of testing raw materials for purity.
2. Finished products are thoroughly tested for conformity to label statements.
3. No new products are released without subjecting them to physiological tests.

Our laboratory is modern and complete and is manned by competent university trained chemists. No expense is spared to make research complete. No preparations are ever offered the laity.

Such is the background of Smith-Dorsey products.

THE SMITH-DORSEY COMPANY, LINCOLN, NEBRASKA

BOOK REVIEWS

(Continued from Page 18)

For many the book will be of value for reference, to learn the details of tests and methods, and for numerous statistical data such as percentages, which are regularly recorded. The experienced psychiatrist will read the Manual with discriminative interest. The student of psychiatry should study the textbooks of other authors as well as the Manual, for the benefit of comparison of various psychiatric concepts, particularly those in reference to the psychoneuroses and other so-called "functional" mental disorders.

G. M.

TWENTY-FIVE YEARS AGO

(Continued from Text Page 248)

and every county society should be represented and every delegate in his place on the night of April 14 (Tuesday) at the Hotel Potter, Santa Barbara. Attacks upon medical men in the form of suits for alleged malpractice have increased enormously and reached serious proportions. Not one such suit was justified and not one was lost by us during the past year. Nor do our attorneys fear that such suits will go against us or be held to stand on appeal. But they cost money and time and trouble to defend, and if they are not carefully studied and defended, and verdicts allowed to go against physicians, there will be a perfect deluge of such actions and our profession will be mulcted of many thousands of dollars.

Then we shall have the question of fees under this insurance act and the manner in which practice is diverted, together with the relation of this cheap work to subsequent malpractice suits which the society will have to defend, a most serious question. Should a member who signs this fee contract be allowed to keep his membership, and if he is, should he be defended by the Society in case of a suit arising from such work? Do not fail to be at the meeting and let each county unit see to it that it elects delegates who will surely attend.

What construction shall be put upon the income tax and how will it affect our relations with our patients? Shall we notify them that the law requires us to sue for an account in order to prove that it is bad? Shall we establish a credit department in connection with the work of the State Society? There are certainly plenty of very important questions for the House of Delegates to consider.

⁂

Forty-Fourth Annual Meeting—Santa Barbara, Hotel Potter, April 14, 15, and 16, 1914—Railroad Rates.—The customary railroad rate of one and one-third fare, provided fifty or more are in attendance, will prevail. When you buy your ticket to go to Santa Barbara, pay the full fare and get a receipt-certificate. When you get to Santa Barbara, present this to the secretary to be signed and then when you get your return ticket hand this receipt to the agent and he will give you a return ticket for one-third the full fare. Do not fail to get the receipt-certificate or to have it signed by the secretary, for if you do, you have no redress. . . .

From an Original Article on "Some Remarks on the Industrial Insurance Act," by Frank P. Topping, M. D., San Francisco.—The evolution of the Industrial Compensation Act is interesting, to say the least; quite interesting from many angles. Interesting to the members of the medical profession, to the casualty and liability companies, to the workmen as individuals, and should be interesting to the various labor unions whose members will constitute the vast majority of all who will (or are supposed to) benefit by the Boynton Act—a law.

I trust my remarks will not prove offensive to the Industrial Accident Commission, whose members I believe to be working for a just interpretation and enforcement of the law. . . .

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

Information and circulars upon request

GLencourt 5989

It has been often stated (by persons who do not know) that there is a "Doctor's Trust"—a "Doctor's Union." Would that it were so, for thereby many of the hardships and much of the injustice resulting from this law could then be easily controlled and rectified. As a matter of fact, in San Francisco County there are (according to the last published official list of the state directory) 1,119 persons entitled to practice medicine, of whom 560 are members of the County Medical Society. With 50 per cent of the profession joined in an association, it would appear that some concerted action to secure justice to the medical profession could be taken. . . .

Why should you, Mr. Medical Man, visit a patient, say in an outlying district, in the interest of a prosperous dividend-paying casualty company with a large capitalization and reserve fund; with some of the highest salaried men as managers, resident agents, etc., in their employ for the paltry sum of $1.50 to save a human life? A visit that may take you from your practice for two or three hours. A visit that may save the company hundreds of dollars.

And why should you, Mr. Working Man, expect a first-class service to possibly save your life for the sum of $1.50? Do you hold your life so cheap? Do you regard the use of your right arm (on which you may depend to earn your daily bread) as worth $10 or $12.50? Are you not entitled to the best service obtainable? Yes? Then make the company who insures your employer obtain the services of men capable of giving you the treatment to which you are entitled, instead of the cheap service, based on the cut-rate, nonliving wage the company offers. Think this over, Mr. Working Man! . . .

Mr. Commissioner, the schedule contemplated by your board is far less than would be charged by any reasonable, capable medical man for the average working man. . . .

I think that the minimum fee is your idea, to govern all. It is not for you to revise our fee bill, nor to establish our fees. You have proposed the minimum (barring charity). Medical men as a class the world over do much work for nothing. No decent, self-respecting medical man ever refuses to treat the deserving poor without any thought of remuneration; nor refuses to administer to their ills; nor to answer calls at any reasonable hour of the day or night when occasion demands. To help them in many other little ways; to give but one class of service—the best in a man—is our privilege. But, Mr. Commissioner, there is a difference in this rate, and the rate that should be charged to a man earning at the minimum scale $3 per day, and ranging as high as $7 per day (and getting it). It is true that we treat some people for nothing. We are glad to do it and are proud of it. It is true that we reduce our fees in some cases, which we deem deserving, to an amount even less than the fee schedule proposed; but to expect us to enter into contracts with the large indemnity companies (who, by the way, are not in business for charity) or to treat cases for the state at these absurd rates is more than the average self-respecting practitioner should be asked to do. It is more than you have a right to ask, Mr. Commissioner! It is more than you have a right to demand, Mr. Insurance Man! It is not the service you are entitled to, Mr. Working Man! . . .

From an Original Article on "Some Sources of Error in Blood-Pressure Measurements," by Eugene S. Kilgore, M. D., San Francisco, with the Collaboration of W. H. Stabler.—Two years ago you appointed Dr. F. M. Pottenger, Dr. R. L. Wilbur, Dr. H. D. Power, and Dr. G. F. Reinhardt a committee to investigate the effect of athletics on the health of the participants. This paper contains a partial report of some work which was undertaken as an introduction to this problem at the Students' Infirmary in Berkeley under the influence of Doctor Reinhardt, the member of your committee at the University of California. Since blood pressure measurements occupy a prominent place in such investigations, it seemed primarily desirable to know how much they can be depended upon; particularly in comparative studies, how closely the observations of one person will parallel those of another. For the pres-

TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

ent, attention is limited to some of the ordinary types of instrument in use among practitioners. . . .

Summary.—The soft tissues of the arm give rise to little if any error in blood-pressure measurements. The resistance of hypertonic arterial walls has a greater influence, and perhaps at times produces large errors; although calcareous arteries may not give rise to an appreciable error. A cuff at least 12 centimeters wide should be used. Palpation and auscultation systolic readings have simplicity and definiteness to recommend them.

Experiments are reported which show the amount of variable error in palpation systolic readings for two observers. Similar experiments to show relation between palpation readings and auscultation readings for systolic pressure.

For diastolic pressure determinations the auscultatory method has the advantages of ease and definiteness of reading. Types of manometers are considered. Mercury instruments should not be used for oscillatory readings.

From an Original Article on "A Case of Hemoglobinuric Fever," by Dr. Harry B. Reynolds, Palo Alto.—Hemoglobinuric or "blackwater fever" occurs in the United States almost exclusively in the Southern States from Texas east, being most frequent in the lower Mississippi Valley.

Its occurrence in California is such a rarity as to warrant the report of the following case, which was seen by the writer in association with Dr. J. E. Chapin of Redwood City: . . .

From an Original Article on "Madelung's Deformity," by Howard F. Adler, M.D., San Francisco.—The condition known as Madelung's deformity or manus valga, as he chose to call it, is not only an extremely rare condition, but is also of interest because so few know that the same conditions which give rise to pes valgus or club foot, may cause an analogous deformity to the wrists.

Our first records to anything of the sort date back to 1825, when Begin first noted among adult male workers in the cloth factories of France, and especially those engaged in continuous heavy work with press levers, that there occurred quite often a painless, forward dislocation of the wrists. Nine years later rather indefinite reference was again made to this condition by the French surgeon, Dupuytren, to whom this discovery has wrongly been attributed by some, since we now know that in all probability all these cases were a form of professional deformity. From 1834 to 1878 there are about seven records of similar wrist subluxations, but, for various reasons, we cannot class them as typical Madelung deformities. . . .

From an Original Article on "Intratracheal Anesthesia," by Saxton Pope, M.D., San Francisco.—This is the present stage of development of the intratracheal anesthesia apparatus in use at the University Hospital:

Its principal features are compactness, a means for the accurate regulation of the proportion of ether and air, electric heating to volatilize the ether, and, of course, the usual pressure and safety valve attachments.

The volume of air passing out of the machine is registered by a revolving float, bobbing up or down in a graduated glass cylinder—an idea adapted from Connell's apparatus.

Having the number of drops per minute and the liters of air per minute known, the percentage of ether can be determined. An average of 14 per cent per volume is required to maintain anesthesia.

The air is supplied either from an electric pump, a compressed air tank, or a foot bellows.

This apparatus has been used repeatedly for intratracheal anesthesia and has served its purpose most admirably.

From an Original Article on "Vaccination Against Tuberculosis *with Von Ruck Vaccine," by Frank Neall Robinson, M.D., Monrovia.*—For a number of years Dr. Karl von Ruck of Asheville, North Carolina, has been working along the line of immunization in tuberculosis. Ever since the introduction of the watery extract of tubercle bacilli (1897) his whole endeavor has been to improve this product, and to this end his studies have been in experimentation with the several component parts of the tubercle bacilli, and their action on the immunizing mechanism. When Bordet and Gengou first published their experiments in "Complement Fixation" he was among the first in this country to see the possibilities of it, and began experimenting with it in his work in his research laboratory. . . .

From an Original Article on "Treatment of Gonorrhea in the Female," by John C. Spencer, M.D., San Francisco. Before proceeding to the consideration of the subject named in the title, particular stress is laid upon making certain of the diagnosis of gonorrhea. The time-honored method of making a smear on a slide or cover-glass, then staining and demonstrating the presence of intracellular diplococci, will not stand the test of more modern methods of accuracy. Until within fairly recent times it has been customary to rely upon the Gram-stain as practically a specific diagnostic stain. This stain acts identically similarly with the micrococcus catarrhalis. As is well known, the latter organism morphologically so closely resembles the gonococcus that the two are only distinguishable culturally. . . .

From an Original Article on "Roentgen Rays and Mesothorium in Gynecologic Practice: Report on Their Application at Several German University Clinics from Personal Observation," by Henry J. Kreutzmann, M. D., San Francisco.—Before I start to narrate my observations on application of roentgen rays and of mesothorium in diseases of women, as I saw it at different German university women's clinics during a visit in October and November, 1913, I wish to make a personal remark.

Having enjoyed a good medical education, with excellent clinical facilities, it was natural for me all through my professional life as a physician to be rather conservative, to adhere to what I had learned during the time of my training as student and assistant physician. There is wonderful, rapid progress in the science and practice of medicine and I have endeavored to keep in line by reading good periodicals, by listening to good papers, by traveling and visiting the clinics and lectures of leading men. But I have always considered it a lack of fundamental medical education to rush to every new fad in medicine, to take up everything new that was placed before us as the thing, only to be dropped in a short time as worthless. . . .

TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

P. de Obarrio, M.D., San Francisco.—In the course of some detailed observations in two series of fifty cataract extractions each, my attention has been called to the fact of a certain hyperemic state of the conjunctiva. It has been of rather frequent occurrence to observe a slight irritation after extractions, but of no serious nature. This congestion of the conjunctiva is of the nature you are apt to find in healing wounds, and in all cases it has subsided after the routine treatment of local applications, either of heat or cold, according to the time expired after the operation. I lay stress on this matter, for it is my object to call the attention to the fact that it is not to this physiological reaction, so to speak, that I am to refer, but to some persistent vasodilator disturbance of obstinate character appearing immediately after the surgical interference and existing for a more or less indefinite period. This symptom may or may not be accompanied with pain, but as a rule there is no pain whatever.

The general course of such a case, as I will immediately relate, will, I think, demonstrate better my point. . . .

From an Original Article on "Note on the Saturation Point of Serum for Normal Lipoids and Cholesterin," by Clarence Quinan, M.D., San Francisco.—Conclusions:

1. Pure cholesterin is very slightly, if at all, soluble in fresh bullocks' serum.

2. Esterification of cholesterin does not occur to any appreciable extent in fresh bullock's serum *in vitro.*

3. The saturation point of a serum for its own proper lipoids is only 0.1 per cent in excess of the normal content.

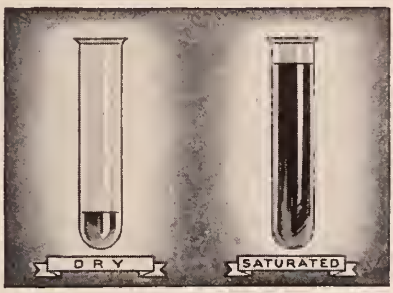
From an Original Article on "Report of a Case of Systemic Blastomycosis," by Harold P. Hill, M.D., and E. C. Dickson, M.D., San Francisco. — A certain amount of interest is attached to this case, insomuch as previously no case of systemic blastomycosis has been reported in California. We have had a number of infections with a type of fungus closely related but which differs in several characteristics from blastomycosis and which, with the exception of one case reported from Buenos Aires by Werincke, seems peculiar to California. In 1894, Gilchrist described the first case of blastomycetic dermatitis, and in 1902 it was recognized that the infection became generalized or systemic. Since Walker and Montgomery's report of that year, reports of systemic infection with blastomycetes have been frequently made, the large majority of these cases occurring in or around Chicago. The type occurring in California was first reported in 1894 by Dr. E. Rixford, and a full report of cases occurring to 1905 was given by Doctor Ophüls, who suggested the name "oidium coccidioides" for the organism. The clinical course of systemic blastomycosis and coccidioidal granuloma has a close similarity. The chief differences between the two types of infection consist in the mode of multiplication of the organisms and their channels of distribution. The blastomycetes multiply by budding; the oidiococcidioides by endosporulation. The former is distributed mainly by the blood, the latter by the lymph channels. It is not necessary to describe these organisms, their cultural characteristics or speculate as to their relationship. It is interesting to note that the case here described developed in California, where previously only coccidioidal granuloma had been found and was an infection with blastomycetes. . . .

From an Original Article on "A Case of Veronal Poisoning," by Edward Swift, M.D., Los Angeles.—The patient was a woman of forty-two years. She had always been in good health, but was of a highly neurotic temperament. At 11 a. m. I was called to see her, though I had seen her the night before, when she was apparently in perfect health but somewhat worried over some domestic troubles. I received the telephone call from her brother, who informed

(Continued on Page 26)

Three Reasons

WHY RY-KRISP IS SO HELPFUL IN CASES OF COMMON CONSTIPATION



HIGH ABSORPTION POWER...
Ry-Krisp, because of its low moisture content, only 6.8%, and its porous structure, has an exceedingly high absorbing power — one wafer, carrying only 4.5 grams of available carbohydrates, will absorb 5 times its weight in water. Note moisture content of dry and saturated Ry-Krisp wafer at left.

HIGH PENTOSAN AND CRUDE FIBRE CONTENT...
Ry-Krisp is simply whole rye, salt and water, double baked for brittle crispness. It has a high natural percentage of bran, which provides bulk, and a high pentosan and crude fibre content to stimulate normal peristaltic action.

A TEMPTING, DELICIOUS FOOD
Ry-Krisp involves no unpleasant dosage. Instead, it offers the tempting, crunchy goodness of a natural, delicious food. Patients eat it regularly and enjoy it... a fact which makes Ry-Krisp particularly valuable in prescribing to children, and to busy men and women tied down to a daily routine.

Ry-Krisp is packed in individually waxed paper containers to protect its freshness. Available at grocery stores everywhere. For FREE samples, and Research Laboratory Report, use coupon below.

TWENTY-FIVE YEARS AGO

(Continued from Page 24)

me that though his sister had gone to bed the previous night at ten o'clock, she had as yet shown no evidence of awakening. . . .

From Society Reports—"Proceedings of the San Francisco County Medical Society."—During the month of January the following meetings were held: . . .

Eye, Ear, Nose, and Throat Section.—January meeting: Dr. H. Y. McNaught in the chair.

Two cases were shown by Kaspar Pischel: first, a case of old iritis in which the anterior lens capsule showed whirls of sulci like finger-prints; second, a case of legal importance. The patient claimed that he had always seen well with both eyes, but that the sight of the left eye was destroyed by a piece of steel. The sight in that eye is diminished to counting fingers in the upper field of vision only. The ophthalmoscopic examination does not show any sign of injury but a congenital malformation of the disc. . . .

Dr. H. B. Graham exhibited a case of tumor of the nose and orbits, involving the middle third of the septum, the ethmoids and middle turbinates of both sides, the inner walls of the orbits and the orbital rim of both maxillary bones. There was exophthalmus, circular scotomata, slight papillitis and retinal hemorrhages in both eyes. The tumor was hard and in the nose presented a smooth, pale surface which bled easily. The x-ray showed no encroachment on the cranial cavity. The diagnosis lay between osteoma, osteosarcoma, and endothelioma. . . .

From "Resolutions Adopted by Los Angeles."—1. Resolutions in Regard to Fee Tables of Workingmen's Compensation Act.

WHEREAS, The State Industrial Commission, in order to carry out the provisions of the recently enacted Workingmen's Compensation Law of California, which is intended

Cosmetics and Your Patient's Morale

THE DOCTOR IS OF NECESSITY A STUDENT OF LIFE Each new patient presents a new study, a new problem. Psychology plays an important role in the course of treatment he prescribes With some patients he must be frank to a point of harshness, with others he must be gentle and coaxing. The nature of the illness and, more particularly, the nature of the patient determine his attitude He knows from experience the value of bolstering his patient's morale. As a student of psychology he knows that few things are more depressing to a woman than the fear that she is losing her charm, that when she no longer cares how she looks the chances are she has lost touch with a vital interest in life. And because he appreciates the importance of a sensible interest in personal appearance he quite rightly encourages his patients to look their best at all times. FINE COSMETICS appeal to that interest That is why they deserve to be recommended by doctors who are, after all, greatly concerned with their patient's morale.

to safeguard the economic efficiency and prosperity of citizens engaged in industrial occupations, an object with which the ethical medical profession is in deep sympathy, as is evidenced by the service of its members in the past, in caring for many of the unfortunate sick without cost, in hospitals, dispensaries, and in private practice; and

WHEREAS, The State Industrial Commission of California, in order to carry out the provisions of the above law, has found it necessary to adopt a definite and fixed medical and surgical fee table in which minimum fees are enumerated, these fees being below those in general vogue among the ethical profession of this state; and

WHEREAS, The ethical medical profession has itself refrained from the adoption of arbitrary fee tables because it is difficult to make a fixed charge for services in the treatment of diseases and injuries, where the amount of skill and responsibility, both required and given, is a constantly varying factor, so that a fixed and arbitrary fee table could do injustice to both patient and physician; now, therefore, be it

Resolved, By the Board of Councilors of the Los Angeles County Medical Association (an organization established in 1871, and having more than six hundred ethical practitioners of medicine and surgery) that this Board, because of the above and other reasons, respectfully requests the California State Industrial Commission to pass a resolution and print on the fee table they have submitted, a statement to the effect that that Commission understands fully the difficulty and the inequality of an inelastic fee table for medical and surgical services, and that the minimum fees presented by the Commission are so made because of the limited resources of the State Industrial Insurance Fund, and because of the comparatively small financial income of the bulk of citizens, whom the Industrial Law is especially intended to protect and benefit; and be it further

Resolved, That it is the opinion of the Board of Councilors that some such resolution or statement of record by the California State Industrial Commission, should be made by that honorable Commission, lest, as time goes on, an injustice be done the very profession, which, above all

and on February 9, 1939, his license was revoked on each count.

Edward J. Buckley, M. D., was charged with aiding and abetting an unlicensed practitioner, *i. e.*, William Van Buren. On February 8, 1939, was found guilty and placed on probation for five years, provided that he cease practice on March 1, 1939, and that he shall not resume practice until July 1, 1939, and that he report at each San Francisco meeting during the period of his probation.

Clair W. Fulton, M.D., charged with use of fictitious name. On February 9, 1939, was placed on probation for five years, and to report at each Los Angeles meeting.

Walter C. Middleton, Drugless Practitioner, charged with practicing beyond the limitation of his certificate, was on February 9, 1939, placed on probation for three years. To report at each San Francisco meeting.

Milton F. Novotny, M.D., alleged addiction. On February 8, 1939, was placed on probation for five years, with the understanding that he cease practice immediately and not resume practice until August 1, 1939; that he not be permitted to apply for or have a Federal narcotic permit or have narcotics in his possession.

Harvey Smith, M.D., based on record of conviction of driving while intoxicated, was on February 9, 1939, placed on probation for a period of five years, with the understanding that he abstain from all alcoholic beverages and report at each Los Angeles meeting.

Joseph T. Wrenn, M.D. Charged with aiding and abetting an unlicensed practitioner, *i. e.*, William Van Buren. License was revoked on February 8, 1939, provided that if he immediately file a stipulation with the Board that he would not aid or abet an unlicensed individual, nor advertise other than by the use of the ordinary business card, said revocation would be set aside and he would be placed on probation for a period of five years, he to report at each San Francisco meeting. Stipulation filed February 8, 1938.

William H. Young, M.D., charged with (1) aiding and abetting, (2) use of fictitious name, in connection with the so-called Samaritan Treatment for Alcoholism, San Francisco Branch, was on February 9, 1939, found guilty of both charges and his license revoked.

* * *

Approximately seventy applicants, comprising physicians and surgeons, chiropodists, and drugless practitioners, wrote the regular examination.

the State of New York to endorse the Italian license or diploma to practice medicine of Dr. Gustave G. E. de Luca. The Board refused to endorse the license on the ground that there is great uncertainty whether the standards of the European institutions today are comparable to what they were when the law was enacted which gives the Commissioner and the Board of Regents the right to endorse foreign licenses without examination. The Board offered the petitioner in this case the opportunity to take the licensing examinations." (*Journal of the American Medical Association,* February 4, 1939, page 455.)

Under the caption "Medicine" the magazine *Time,* issue of February 13, 1939, page 38, printed an interesting article headed "Refugee Physicians." Therein is related that before the reign of Hitler there were 50,000 physicians in Germany; that since 1933 non-Aryan doctors have been gradually pushed out of practice. "The crowning blow came last October when the licenses of all Jewish physicians were revoked. . . . Although Germany now faces a shortage of trained physicians and has been compelled to reduce the period of medical education by two full years, more than half of the ostracized Jewish physicians still remain in Germany, helpless and impoverished. . . . Most of those physicians lucky enough to escape have come to the United States."

"An 'underground railroad' to a doctor's office, where illegal operations were allegedly performed was described by a 13-year-old girl, found recently in her San Pedro home in a critical condition. As a result of the asserted operation, according to Juvenile Officer L. R. Howsley, six persons are being investigated as possible operators of the 'system.' Howsley said the girl complained to her mother of illness on January 16 and the parent was told by a San Pedro doctor that her daughter was to become a mother. A few days later, without knowledge of the physician, according to the girl's story, the illegal operation was performed and she was taken to her home to recover. Alarmed by the girl's critical condition, the mother was reported to have summoned still another doctor who treated her and reported the case to police. Howsley said the mother admitted that friends told her how to contact certain persons to bring about the operation. It was declared by the mother and girl that they were driven in an automobile through the night by a devious route, winding about and back-tracking along country roads and through city streets to the place where the operation was performed. . . . He (Howsley) stated his department was waiting until the girl recovers before attempting to fully identify members of the 'ring'." (San Pedro *News-Pilot,* January 31, 1939.)

"Accused of practicing medicine without a license, Dick Smith, thirty-nine, was arrested here last night. With him was jailed Susie King, thirty-two, assertedly his assistant. They were arrested by city police on a misdemeanor warrant issued in Firebaugh. Smith was taken to Firebaugh to face the charges by Thomas P. Hunter, special agent of the State Medical Board of Examiners. Miss King was given a suspended sentence on a vagrancy count here on the condition she leave Merced. According to Hunter the pair was treating cotton camp laborers in the Firebaugh district in Madera and Fresno counties with herbs. Hunter said Smith was unable to read or write and Miss King served as his secretary." (Stockton *Record,* February 3, 1939.)

"Donald W. Bell, thirty-five, Watsonville Chiropractor accused of giving Mike Jurich a $5.00 bad check, was arraigned Saturday morning before Police Judge Miller Chandler and will have preliminary hearing at 10 a. m. Monday." (Watsonville *Register Pajaronian,* January 28, 1939.)

"Two men and two women, all indicted by the grand jury last November for conspiracy to violate the Business and

BOARD OF MEDICAL EXAMINERS

(Continued from Page 29)

Professions Code of California, pleaded guilty and asked for probation in Superior Judge Jacks' Court recently. Thomas F. Huston, 1153 Bush Street; John A. Stevens, Ruth Nielson and Juanita Butcher, were indicted on eleven counts, including practicing medicine without a license. Judge Jacks set the probation hearing for February 28." (San Francisco *Chronicle*, February 3, 1939.) Reports of the Investigation Department indicate the individuals mentioned were operating what was known as the Samaritan Treatment for Alcoholism at 1153 Bush Street, San Francisco.

"An appeal has been made by the Police Commission to the City Attorney for a ruling on the extent of its powers in regulating massage parlors in Los Angeles. . . . Questioning the legal aspects of permitting one group of masseuses to treat the opposite sex and not another, where neither held State medical licenses, the board decided to ask the City Attorney to pass on the question. Captain Starritt also assailed numerous institutions where those taking up massage for a livelihood study and obtain 'diplomas'. He said that such certificates have no real value since the State itself has established no standards of the profession." (Los Angeles *Times*, February 6, 1939.)

"Dr. Louis Kameny, convicted of conspiracy to commit grand theft in connection with an insurance fraud, was released from the balance of his three years' probation yesterday by Superior Judge Lincoln S. Church. Doctor Kameny, through his attorney, Leo Sullivan, pleaded that he wished to appear before the State Board of Medical Examiners with a clean slate, in order to petition for the return of his license, ordered revoked after his conviction in December, 1937. . . ." (Oakland *Tribune*, February 5, 1939.)

"The San Francisco County Grand Jury spent more than three hours last night listening to testimony in the abortion-death of Mrs. Betty Barsotti, twenty-four, who died at Franklin Hospital, February 6. Before her death, Mrs. Barsotti told police she had had an abortion in a 'house on Cortland Avenue,' the exact location of which she was not certain. Chief witnesses were Dr. Reginald Grant, who treated her at the hospital before her death, and Eugene Aureguy, private investigator, who was a principal figure in the Constance May Gavin-Flood case. After Doctor Grant had testified to her death, Aureguy told Assistant District Attorney Harry J. Neubarth he had been retained by the physician to investigate the case, immediately after Mrs. Barsotti entered the hospital." (San Francisco *Chronicle*, February 9, 1939.)

"In announcing that he plans to speed the administration of justice during his régime as attorney general, former Governor Frank Murphy of Michigan said: 'Delay is often as good as winning a criminal case.' Therein the new attorney general has put his finger upon one of the glaring defects in our judicial system. Delay is a device always resorted to by those who make a business of defending criminals. It opens a detour marked with light sentences or no sentences and avoids the highway that should be the lot of the confirmed criminal—adequate, swift and certain punishment. . . . If Attorney-General Murphy is successful in speeding up justice, he will be a knight in armor to all those fighting the battle against crime." (Editorial, Sacramento *Bee*, January 31, 1939.)

"A golden shovel bit into soft earth at California and Maple streets yesterday to signalize beginning of construction on the new $350,000 Hahnemann Hospital. Dr. James W. Ward, dean of the homeopathic medical profession in San Francisco and founder of the Homeopathic Foundation of California, builders of the hospital, turned the first spade-

MERTHIOLATE

(Sodium Ethyl Mercuri Thiosalicylate, Lilly)

Germicidal properties are the first thought in selecting an antiseptic, but compatibility with tissues should be considered as a point of equal importance. With 'Merthiolate' (Sodium Ethyl Mercuri Thiosalicylate, Lilly), antisepsis of skin and mucous membranes can be accomplished with minimal cellular damage.

Tincture 'Merthiolate' is adapted for presurgical disinfection of the skin. Solution 'Merthiolate' is stainless and is intended for general clinical use.

CALIFORNIA
AND
WESTERN MEDICINE

OFFICIAL JOURNAL OF THE CALIFORNIA MEDICAL ASSOCIATION

VOL. 50 MARCH, 1939 NO. 3

California and Western Medicine
Owned and Published by the
CALIFORNIA MEDICAL ASSOCIATION
Four Fifty Sutter, Room 2004, San Francisco, Phone DOuglas 0062

Address editorial, business and advertising communications to Dr. George H. Kress as per address above.

EDITOR . . . . GEORGE H. KRESS

Advertisements.—The Journal is published on the seventh of the month. Advertising copy must be received not later than the fifteenth of the month preceding issue. Advertising rates will be sent on request.

BUSINESS MANAGER . . . . . GEORGE H. KRESS
Advertising Representative for Northern California
L. J. FLYNN, 544 Market Street, San Francisco (DOuglas 0577)

Copyright, 1939, by the California Medical Association

Subscription prices, $5 ($6 for foreign countries); single copies, 50 cents.

Volumes begin with the first of January and the first of July. Subscriptions may commence at any time.

Change of Address.—Request for change of address should give both the old and the new address. No change in any address on the mailing list will be made until such change is requested by county secretaries or by the member concerned.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the Journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this Journal. New copy must be sent to the editorial office not later than the fifteenth day of the month preceding the date of publication.

Contributions—Length of Articles: Extra Costs.—Original articles should not exceed three and one-half pages in length. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—California and Western Medicine has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested that contributors to this Journal write to its office requesting a copy of this leaflet.

EDITORIALS[†]

CALIFORNIA PHYSICIANS' SERVICE—INCORPORATED ON FEBRUARY 2, 1939

Names and Symbols.—"California Physicians' Service," or "C.P.S.," as a name and symbol will soon sound as familiar to Doctors of Medicine as "California Medical Association," or "C.M.A." For, on February 2, 1939, the Articles of Incorporation of California Physicians' Service (which appeared on page 134 of last month's issue of California and Western Medicine) were filed with the Secretary of State of California, and the first Board of Trustees of the new corporation was elected by the administrative members. The California Medical Association Council[*] having previously, on January 14, 1939, taken the necessary steps to enable the new medical service promptly to assume its work, its board of directors, to be known as the Board of Trustees, met on February 4, 1939, and elected the following officers: President, Ray Lyman Wilbur; Vice-President, Lowell S. Goin; Vice-President, C. Kelly Canelo; Secretary, Alson R. Kilgore; Assistant Secretary, T. Henshaw Kelly; Treasurer, Alson R. Kilgore; Assistant Treasurer, T. Henshaw Kelly.

They appointed Morton R. Gibbons, Sr., M. D., San Francisco, as Medical Director, and A. W. Widenham of San Francisco as General Manager.

The Trustees, according to the By-Laws, appointed an Executive Committee consisting of T. Henshaw Kelly (Chairman), Samuel Ayres, Jr., and Alson R. Kilgore.

The new organization has established its central office in San Francisco, where it may be addressed: California Physicians' Service, 602 Mills Building, 220 Montgomery Street, San Francisco, or communicated with by telephone: EXbrook 3212.

* * *

Explanatory Brochure and Registration Blanks.—Before this issue of California and Western Medicine is placed on the desks of members of the California Medical Association, it is expected that an explanatory brochure, prepared by the California Physicians' Service Executive Committee (containing abstract of by-laws and other needed information*) will have been received by every doctor of medicine licensed to practice in California. With this pamphlet will also be sent a registration blank. Every California Medical Association member, therefore, is requested to read carefully the contents of the brochure, and to send the registration blank to the California Physicians' Service, as promptly as possible, at the address given above. An appreciated service will likewise be rendered if every member of the Association will constitute himself a Committee of One to urge other members to do the same.

[†] Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

[*] See California and Western Medicine, February, 1939, Council minutes, Item 17, on page 133.

In addition, members of the California Medical Association who are acquainted with nonmembers of the California Medical Association are requested to suggest to such physicians that they also mail their registration replies to the Mills Building office

* * *

Coöperation in Prompt Reply Will Be Appreciated.—This coöperation may be of real value because, at the present time, the California Legislature is in session and has under consideration certain compulsory health insurance bills. Prompt approval, by the entire medical profession of the State of California, of the California Medical Association's voluntary plan of medical service on a periodic payment basis will be an important indication to the legislators that the voluntary plan of so-called health insurance has the whole-hearted support of the thousands of licensed physicians of California; to whom the State and its people are much indebted for many years of altruistic service in the promotion of activities designed to conserve health and life, and whose intimate knowledge of the incidence of disease should make their opinions worthy of most careful consideration by all groups and individuals who profess interest in the betterment of the health of the people.

* * *

Reaction of the Public as Shown in the Press. The reaction of the people of California to the statewide, voluntary medical service plan proposed by the California Medical Association, in so far as it has been reflected in editorial and other articles in the daily and weekly newspapers of California, has been revealed in part to readers of CALIFORNIA AND WESTERN MEDICINE through the excerpts which have appeared in the Press Clippings columns of the OFFICIAL JOURNAL's latest issues. Because it is important for members of the medical profession to evaluate properly the reaction of the public to the proposed medical service plans, the attention of readers is again called to the quotations given, even though it may seem strange to some physicians to find that kind of reading matter in the pages of a medical publication. However, it must never be forgotten that CALIFORNIA AND WESTERN MEDICINE is primarily the official publication of organized medicine in California, and in that capacity cannot evade its responsibility to present to its reading clientele all important information pertinent to the interests of medicine, both organized and scientific.

* * *

Future Communications from California Physicians' Service.—Henceforth, official communications from California Physicians' Service will be sent out from the offices of that corporation; although at all times the pages of CALIFORNIA AND WESTERN MEDICINE will be available for additional publicity. For easier reference, such items in future issues will be placed under the caption, "California Physicians' Service."

* * *

A United Front Should Now Be in Evidence. In the meantime, it is to be hoped that all members of the California Medical Association will give to the Association's medical service plans, as expressed in "California Physicians' Service," the fullest possible support. Granted that there may be members of the State Association who prefer to be proponents or protagonists of a system of compulsory health insurance, it certainly would seem a proper course of conduct for such physicians not to appear before mixed audiences in advocacy of compulsory health systems, but, rather, to bide a bit with their promulgations until the new voluntary system espoused by their fellows through their official organization has had an opportunity of being tried out in practice.

In short, since the members of the California Medical Association, through their constituted authorities, the House of Delegates and Council, have embarked upon the institution of a state-wide voluntary medical service plan to which much publicity has been given, from one end of the United States to the other, it now behooves every one of the more than six thousand State Association members and the component county medical societies to give the fullest possible support in carrying the plans through to successful issue. This is not too much to ask, and that much is expected from one and all.

CALIFORNIA ADMINISTRATION COMPULSORY HEALTH INSURANCE BILLS—
A. B. 2172 AND S. B. 1128

A Voluntary Medical Service Plan Is Preferred by the Medical Profession.—A voluntary medical service plan has been espoused by the California Medical Association. The inference, therefore, is clear, that a voluntary system of so-called health insurance is preferred by members of the medical profession of California rather than a compulsory health insurance system, supported, as it would need to be, through taxation, and administered by public or political agencies.

* * *

The So-Called "Administration Health Insurance" Bill.—Prior to the State election on November 8, 1938, considerable publicity was given by some of the candidates for office to proposed health insurance legislation; and the press recurrently printed news items concerning the proposed "Administration Health Insurance" law. Little more than rumor, however, was forthcoming, until January 25, when Assembly Bill 2172 and its companion Senate Bill 1128 were submitted to the lower and upper chambers of the California Legislature. In their titles, the two bills state they relate "to a system of health insurance within the system of unemployment reserves," and, further, that they are acts "to establish a system of social insurance," and that these acts "shall be known and may be cited as the Social Insurance Act."

---

* On page 247 of this issue of CALIFORNIA AND WESTERN MEDICINE, the series of questions and answers concerning California Physicians' Service, which appear in the brochure, are given place as part of the Official Journal's permanent record concerning initial steps in the organization of the new corporation.

Article 11, Section 151, states that "The provisions of Articles 11 and 16 of this act establish and provide for a plan of compulsory health insurance *integrated* [italics by Editor] with the system of unemployment insurance, together with plans of voluntary health insurance for which provision is made herein."

It is not possible, at this time, to go into extended discussion of the two measures. They may be said, however, to have been put forward by the various California groups and advisors who have espoused compulsory health insurance as the cure-all for the large amount of so-called, inadequately cared-for illness—be the same imaginary or otherwise—which some of the lay adherents of the plan so often and so vociferously claim does exist.

Members of the Association who wish to acquaint themselves concerning the details of the proposed law should write to the California Supervisor of Documents, 214 State Capitol, Sacramento, requesting a copy of A. B. 2172 or of S. B. 1128. An equally interesting measure is Senator Hollister's proposed law (S. B. 551) which would provide for a medical service plan somewhat more in line with legislative drafts that have come out of Washington, D. C.

* * *

Excerpts From the Bill Are Printed in This Issue.—For the information of readers of the OFFICIAL JOURNAL, Article XV, "Organization of Medical Services," and Article XVI, "Administration," are given in this issue of CALIFORNIA AND WESTERN MEDICINE, on page 211. These are worthy of perusal and careful thought.

At the present time all indications point to a legislative battle concerning these bills. Members of the Association, therefore, are urged to remain alert to the subject and to familiarize themselves with the issues at stake. And this, for the good and sufficient reason that the standards of scientific medicine and medical practice in the proper care of citizens and for the public health are all here vitally involved.

* * *

Past Experience and Clear Thinking Worthy of Consideration.—It may not be amiss for an individual, or a group of individuals, to ponder on generous and altruistic abstractions; but precipitately to transform such theories into law might work untold havoc on the very persons whom the theoretical plans were aimed to help. The past record of achievement in public health advancement, under evolutionary systems of medical practice, combined with the practical common sense and capacity recognizing, when illness actually does exist, that its real elimination needs primary attention to the causes rather than to the symptoms or end-results—these are elements that must continue to be taken into fundamental consideration by those who would ameliorate deficiencies of medical care. More than well-meaning phraseology is needed.

The enactment of a law, no matter how well-intentioned, may be of little avail if, in its administration, the ends desired are not attainable. In the last analysis, the values of things are judged by their end-results.

CALIFORNIA MEDICAL ASSOCIATION'S 1939 ANNUAL SESSION—MAY 1–4

Del Monte Annual Session Almost at Hand. With the sixty-eighth annual session of the California Medical Association distant but a brief two months, it may not be out of place to state that the Hotel Del Monte, the Association's next place of meeting, has been the scene of many notable gatherings of the past; and that its selection for the annual reunion practically always receives the hearty approval of members, as is evidenced by the large number who betake themselves to the Monterey Peninsula whenever that picturesque corner of the State is chosen as the place of reunion.

* * *

Programs of Scientific Sections Have Been Completed.—The California Medical Association Committee on Scientific Work, in conference with the Section Secretaries, agreed upon the arrangement of the complete program at a meeting held in January, and the Section Secretaries have been busily engaged in securing the abstracts of papers to be printed in the Annual Session Supplement that will be a part of the April issue of CALIFORNIA AND WESTERN MEDICINE.

* * *

Hotel Reservations.—Hotel rates appeared on pages 137–138 of the February number. In this current issue, additional information may be found concerning auto courts.* Members who plan to be in attendance, therefore, are advised to make hotel reservations in advance. As a matter of fact, some far-sighted members wrote for their reservations within a week or two after the annual session of the past year.

* * *

Scientific Exhibits and Films Requested.—The Committee on Scientific Work will welcome additional participants in the Scientific Exhibits and the Medical Films programs. All members who have such possible contributions, and who have not yet communicated with the Association Secretary in regard thereto, are urged to do so at once, indicating the nature of their exhibits, and space required; and concerning films, the titles and time required, together with any additional information likely to be needed.

---

* See page 213.

The full program of the Annual Session will appear in a Supplement to the April issue of California and Western Medicine.

CALIFORNIA LEGISLATURE—FIFTY-THIRD SESSION

Constitutional Recess Is Over on March 6.—By March 6, the State Assemblymen and State Senators who, during the February constitutional recess, have been sojourning in their respective home districts, to confer with constituents concerning the 2,768 Assembly bills, sixty-eight Assembly constitutional amendments, sixteen Assembly concurrent resolutions and twenty-nine Assembly joint resolutions introduced into the Lower Chamber, and the 1,227 bills, twenty-four constitutional amendments, nine concurrent resolutions, and fourteen joint resolutions submitted to the Senate, will once more be in Sacramento, to convene and carry on their law-making labors, probably into May or June.

* * *

Former and Present Days: In Relation to New Laws.—The daily lives of physicians in the care of sick and injured persons are ordinarily far removed from the sphere of statute drafting. Indeed, in days gone by, legislatures came and went with little or no influence upon the professional, economic or social welfare of medical men, except, perhaps, in the matter of taxes, or minor amendments to public health matters or a medical practice act. Not so today, however!

* * *

California Medical Association's Committee on Public Policy and Legislation.—In recent years, the duty of keeping check on the mass of proposed laws submitted at each biennial session of the California Legislature has become little less than a very onerous task, the burden of which has largely fallen upon the shoulders of the Chairman of the Committee on Public Policy and Legislation, Dr. Junius B. Harris of Sacramento, and the coworkers his committee has found it necessary to draft into coöperative service.

Eternal vigilance is not only a motto for the Committee on Public Policy and Legislation, but it must be constantly kept in view and practiced, because every one of the hundreds of bills must be carefully scrutinized, if undesirable inclusions, having implications to public health and medical practice activities, are to be detected.

* * *

List of Bills Worthy of Perusal.—On page 213, in this issue of California and Western Medicine, appears a classified list of the many Assembly and Senate bills in which members of the medical profession cannot have other than a natural and a live interest. Every member, consequently, should turn to that list and note for himself the magnitude of the labor given to some of the Association's officers, when those officials are asked not only to discover improper provisions in new measures when they are presented in the January session, but to watch, each and all, for obnoxious additions or modifications of the proposed laws, as they pursue their tortuous and checkered progress in Assembly or Senate committees (where actual presence of the California Medical Association's representatives is not infrequently necessary to counteract the arguments of spokesmen for the opposition or specious interests).

* * *

How Coöperation May Be Given.—The presentation of this subject, along the above lines, is intended to remind our members of the generous service rendered by certain Association officers, to the end that, when appeal for coöperation is made by the Committee on Public Policy and Legislation, the aid requested may be cheerfully and promptly given.

Also, to again call the attention of all, on behalf of the Council, to the unwisdom of component county societies, or of individual members, in passing resolutions or espousing certain proposed statutes, and giving copies of such actions to the proponents of the submitted measures.

The Council of the Association and the Committee on Public Policy and Legislation are glad to know the views of component county societies and of members, but request that such expressions of opinion be forwarded through the Central Office of the California Medical Association. Otherwise, well-meant resolutions and commendation may be brought to the front, for the first time, in Assembly or Senate committee hearings, to become, at times, real sources of embarrassment to the California Medical Association Committee on Public Policy and Legislation. Surely, all must agree that the Committee on Public Policy has more than its share of exacting service, without adding unnecessarily to its labors.

LIBRARY BEQUEST TO LOS ANGELES COUNTY MEDICAL ASSOCIATION

Walter Jarvis Barlow, M. D.—The late Dr. Walter Jarvis Barlow, who on September 4, 1937, passed on from his earthly labors, was ever occupied throughout a very busy professional life in Los Angeles in altruistic endeavor for his fellow citizens. Himself a victim of pulmonary disease, he originated and placed on a sound foundation the Barlow Sanatorium of Los Angeles; so named, by friends, as was the Barlow Medical Library, because his colleagues and coworkers felt that his name should be associated and perpetuated with the outstanding activities he had been instrumental not only in bringing into existence, but in firmly establishing. It was the Editor's privilege, as Faculty Secretary of the University of Southern California's College of Medicine, at a time when Doctor Barlow was Dean, to have been intimately associated with this colleague, who never tired in unostentatious efforts for both his fellows and the profession he so aptly represented. His was primarily a love of service, as was shown when the

Los Angeles County Medical Association proposed to erect a permanent headquarters and library building, even though the Society itself had no books to place therein. At that time Doctor Barlow promptly gave his consent to the removal thither of the Barlow Medical Library, and also to its change of name to Library of the Los Angeles County Medical Association.

Although Doctor Barlow's death occurred in 1937, it was not known until the beginning of the present year that he had remembered the Library of the Los Angeles County Medical Association in his will, the Association receiving, as the first notice of his bequest, a letter with check stating payments for a similar amount would be forwarded quarterly. The excerpt from Doctor Barlow's will, having to do with this legacy, appears in this number of California and Western Medicine, in the Letters department, on page 236.

* * *

Bequest Forms in This Issue of the Official Journal.—With the thought in mind that types of bequest might have a suggestive value to members of the California Medical Association, who may desire to bequeath property, real or personal, to activities designed to promote general or special lines of work in scientific medicine, we prepared several years ago, with legal advice, such convenient forms, and they have since regularly appeared in California and Western Medicine—being printed, in this issue, on advertising page 30. They are again called to the attention of members of the Association in the hope that the example set by the late Morris Herzstein of San Francisco (the income of whose bequest to the California Medical Association is defraying the cost of the cancer exhibit at the Golden Gate International Exposition), and that of the late Walter Jarvis Barlow, in his handsome gift to the Los Angeles County Medical Association for its library, may lead others to think of endowments that would work for the betterment of scientific medicine and so to the advancement of public health.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 210.

Belie in yourself the weaknesses of your country. Water partakes of the qualities, good or bad, of the seams through which it flows; and man of the climate into which he is born. Some owe more to their country than others because a happier zenith lay above them. There is no nation, even of the most cultured, without some inborn defect which its neighbors will not at once strike upon, either for their caution, or their comfort. A commendable skill to eradicate such national weaknesses in yourself, or at least to hide them; thus are you made unique among your kind, for what is least expected is esteemed most highly. There are weaknesses also of race, of rank, of profession, and of age, which, if gathered together in one individual, and not curbed, yield an intolerable monster.—Baltazar Gracian, 1653.

EDITORIAL COMMENT†

NEED FOR ADDITIONAL HOSPITAL RESIDENCIES

This is an age of specialization, and only those who have mastered thoroughly the essentials of a certain branch in a certain calling can hope to achieve any success in life. This is particularly true in medicine where, because of the rapid strides made in that greatest of human sciences, specialization is at its zenith. Indeed, the term "physician and surgeon" has come to mean nothing but mere names which designate membership in a certain class, but poorly defines the professional status of that member in his respective field. Anyone who has watched carefully the present trends in specialized service must come to the conclusion that the general designation of "physician and surgeon" will soon give place to a specific title which will clearly define the professional status and equipment of the title bearer. The kind of diplomas and certificates issued by medical schools and state boards will then be more varied; and just as in teaching we have a kindergarten certificate, a grade-school certificate, a junior or senior high-school certificate, and a junior-college certificate, so in medicine we shall have, in addition to the general certificate, a great variety of other certificates, each revealing the particular branch of service which a certain certificant is qualified to render.

Since such a division in rendition of services is inevitable, it is well to inquire what plans are being made by our educational medical institutions, hospitals included, to provide opportunities for young graduates in medicine and surgery to obtain specialized training in the various branches of the profession. From my own study of the subject, I am convinced that the opportunities for postgraduate training are very limited in scope and woefully inadequate to meet the needs of the aspirants for specialized service. The believer in the noble democratic principle of *La carrière ouverte aux talents* is rudely shocked to discover that, in a profession so important to human welfare as medicine, the finest talents are not always given a chance to develop themselves and attain perfection in any particular branch.

It is not necessary for me to enter into a detailed study of conditions as they exist in the entire United States. It is sufficient for the purposes of this paper to present the situation in California, where I have lived, studied and worked for the greater part of my young life, and I may well assume that the same conditions are paralleled elsewhere with but slight modifications.

The four recognized medical schools in the State of California turn out each year 279 graduates in medicine, distributed as follows: University of California, 61; College of Medical Evangelists,

---

† This department of California and Western Medicine presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

111; University of Southern California, 44; Stanford University, 63. Every one of these graduates would have been glad to continue postgraduate studies in a specialized field for a period of one to three years, but, unfortunately, there are only fifteen hospitals in the state that provide opportunities for specialization, classified in service as follows: internal medicine-general, 14 hospitals; cardiology, 0; communicable diseases, 2; tuberculosis, 8; malignant diseases, 1; pediatrics, 9; neurology, 1; psychiatry, 4; dermatology and syphilology, 2; obstetrics and gynecology, 6; general surgery, 15; neurosurgery, 1; thoracic surgery, 1; anesthesia, 0; orthopedic surgery, 5; urology, 4; ophthalmology, 3; otolaryngology, 4; pathology, 6; radiology, 4; physical therapy, 1. Total number of possible openings available in the fifteen hospitals, 91.

If each of these hospitals were to change its resident staff every year, ninety-one interns, or one-third of the graduating classes, could be accommodated. However, once an intern secures a residency in any specialty, he prefers to stay at least two to three years in the same place, as that is considered the minimum time required for specialization. That makes possible for only 15 per cent of the graduating classes to obtain any kind of a residential position. It is no wonder, then, that resort is had to "wire pulling" in order to obtain by insidious influences what cannot be gotten by sheer merit.

We are all heartily in accord with the general proposition that the object of medical education is to promote the public welfare. No principle is, from the ideal standpoint, more sacred to a well-governed democracy than the principle of open and universal opportunity to all, without distinction as to race or creed, and an equal chance to those possessing similar capacities and talents for individual growth and achievement. But what practical means shall be adopted to carry into execution certain high principles and ideals is a problem which requires immediate solution.

In my mind this baffling problem can be solved satisfactorily by making fuller use of the smaller county hospitals, following in that the example set by teacher-training schools which use the smaller public schools to train the future teachers in our secondary system of education. Thus California, with a population of over six million, is divided, for purposes of administration, into fifty-eight counties. The latest Hospital Number of the American Medical Association lists a total of fifty-two county hospitals in California, showing that nearly every county has its own hospital. It must, however, be regretfully noted that only nine county hospitals are approved for training interns, and of these nine only seven are approved for residencies in specialties. It must further be noted that of the seven hospitals so approved, only two, namely, the Los Angeles and the San Francisco county hospitals, offer a wide diversification of specialty training; the other five hospitals, namely, Fresno, Alameda, San Bernardino, San Diego, and Santa Clara county hospitals, offer facilities for training in only two or three specialties.

What would be the effect of granting recognition to all county hospitals by including them in the approved list of such an organization as the American College of Surgeons? To this question the only answer usually given is that every hospital must conform to certain standards in order to obtain recognition, and it is claimed that no acorn should be allowed in a forest of full-grown oaks. To such objections the answer must be made that in the case of governmental institutions the standards must be so flexible in their application as to permit a gradual remedying of certain defects and shortcomings. There is a general misunderstanding regarding the nature and function of a small county hospital. I, myself, when I first took up the work in a small nonapproved county hospital immediately upon the completion of my internship in a big teaching hospital, had certain misgivings regarding its *raison d'être*. However, when I gained better insight into the spirit which animates the existence of a small county hospital, I found that the retarded development of the county hospital was due to its inability to keep pace with the too rapid shift from a dominantly agricultural to an urbanized society. I have also found that the communities in which such small hospitals are located are most eager to make rapid adjustments in their relation to the new order of things, to adopt the latest methods of progress, and to raise the standard of their civic institutions to such levels as the community's economy will permit. Thus, in the county hospital where I am now employed, one finds, in an old-style structure, the most modern surgical equipment, and a generous budget amply provides for the needs of a rapidly expanding health program. The Board of Supervisors in our smaller American communities consist of public-spirited men of great integrity of character, unselfish in their aims, devoted to the noble cause of public welfare, moved by deep sentiments of civic pride, and inspired by the highest ideals of continued progress in matters pertaining to the betterment of the social conditions of the indigent and helpless. On the other hand, the supervisors are bound by the force of economic circumstances to keep taxation within reasonable bounds and to place restraints on their generous impulses.

The smaller county hospitals need sympathetic interest and guidance rather than castigation or the whip of exclusion. The American College of Surgeons and other similar bodies of national standing should assume the burden of supervising and guiding the county hospitals in the interest of community welfare. If all these hospitals were approved, it would then be possible for every graduate from a medical school, upon completing his internship, to find a place in which he could continue general or specialized training. As nearly every county hospital has on its board practitioners of long experience, some of them outstanding in respective specialties, and others even fellows of the College of Surgeons, they could assume the burden of helping the young graduate worker to acquire greater efficiency in a chosen branch or specialty. Frequent leaves should also be granted for further training under university supervision.

Such a plan would provide advanced training for all graduates.

County Hospital.

William W. Richards,
Marysville.

SYNOVIAL POLYSACCHARID

According to Dr. Karl Meyer[1] and his colleagues of the Arthritis Clinic, Presbyterian Hospital, New York City, human synovial fluid contains a specific polysaccharid. chemically identical with the mucoid polylsaccharid elaborated by Group A Hemolytic streptococci. If this identity is confirmed, it would suggest a wholly new theory of arthritis and rheumatic fever and a newly plausible basis for therapeutic research.

Highly specific lipoids, polysaccharids and other chemical factors common to pathogenic microorganisms and animal tissues, have been a subject of research interest since Forssman[2] discovered the first heterophil lipoid of this type. This "Forssman lipoid" is found in certain strains of intestinal bacteria, and in conjugation with the tissue proteins of certain animal species. It is present, for example, in exceptionally high titer in guinea pig and horse tissues, but is absent from man and the rabbit. If a Forssman-positive vaccine is injected into a Forssman-negative animal (*e. g.,* a rabbit), a high-titer anti-Forssman antibody factor or function is formed. A Forssman-positive animal, however, is apparently incapable of forming these fractional antibodies, or, if formed, rapidly removes them from the circulation by conjugation with fixed tissue lipoids. An anti-Forssman serum injected into a Forssman-negative animal is nontoxic. Injected into a Forssman-positive animal, however, fulminating toxic symptoms may result. Thus, a Forssman-negative antiparatyphoid horse serum is nontoxic on intravenous injection into Forssman-positive guinea pigs. The homologous Forssman-positive rabbit antiserum, however, may cause lethal reactions.

The heterophil antigens of greatest current clinical interest, however, are certain lipoids and polysaccharids in type pneumococci. Since the same lipoids are normally present in horse tissues, an antipneumococcus horse serum is theoretically deficient in one antibody function essential for complete antipneumococcus humoral immunity. Theoretically at least, however, this handicap can be overcome by using rabbit antiserum. Of even greater practical interest is the heterophil carbohydrate, which is also present in human erythrocytes. Antipneumococcus horse serum, therefore, would theoretically be hemolytic or hemagglutinating for man.

Doctor Meyer's alleged identification of his synovial polysaccharid with the mucopolysaccharid of Hemolytic streptococci is based on chemical evidence. On acidulation, human synovial fluid yields about 225 milligrams of his polysaccharids per liter. Each molecule of this polysaccharid contains one equivalent of nitrogen, hexosamin, acetyl and hexuronic acid. It contains no sulfur or phosphorus. Identical fractional components in identical ratios were previously demonstrated by Meyer in polysaccharids isolated from vitreous humor and from the umbilical cord.[2] Almost identical qualitative and quantitative analyses have been reported by Kendall[3] and his coworkers for the mucopolysaccharid isolated from Hemolytic streptococci.

The apparent chemical identity of this streptopolysaccharid with synovial polysaccharid was confirmed by Meyer through a parallel study of their hydrolyses by the autolytic enzyme formed by type pneumococci. Within the limits of the experimental error this enzymic reaction was both qualitatively and quantitatively identical for both polysaccharids.

Since in their hands rabbits injected with heat-killed Hemolytic streptococcus did not yield precipitins or complement-deviating antibodies for the mucopolysaccharid, Kendall[3] and his coworkers concluded that the streptococcus mucopolysaccharid is "serologically inactive." The opposite conclusion is currently reported by Loewenthal[4] of London Hospital and Medical College, who found that by cautiously heating young mucoid phase streptococci (55 degrees, 12 minutes) so as to avoid denaturation, the streptomucopolysaccharid is antigenically active. Antigenic identity of the streptopolysaccharid and synovial polysaccharid, however, has not yet been confirmed by serologic evidence. Until this is done, an autocytotoxic theory of arthritis or rheumatic fever, a theory based on a presumptive immunological vicious circle, would be premature.

Adequate Medical Services Available in Texas County. —An abundance of free clinics, governmental hospitals and philanthropic organizations in Harris County, Texas, makes it possible for every one to obtain medical care, the County Medical Society reveals in a study of medical care during 1937. The survey, reported in *The Journal of the American Medical Association* for January 14, is part of a nation-wide study being sponsored by the Association.

An average of eighty-five patients for each of the 266 physicians included in the study received free treatment in homes, hospitals or doctors' offices during the year. The physicians also reported they had devoted 27,971 hours to free patients in clinics.

A majority of the people, including the low-income groups, could obtain and pay for necessary dental service when they made proper arrangements for obtaining such service. During 1937 the thirty-four dentists included in the survey provided 994 persons with free care in their offices and gave 960 hours of free service in clinics.

Not a single instance of refusal to hospitalize patients was recorded. Facilities for the care of school children were considered adequate.

A social service filter system to prevent persons who can afford to pay from obtaining care at the free clinics and to make fees for low-income groups commensurate with ability to pay was strongly recommended.

Other needs of the county as seen by the Society included additional funds to provide medical care for persons with infectious diseases, especially venereal diseases, and for those with chronic ilnesses who need institutionalized care, and provisions by relief agencies for care of transients and nonresidents who are ineligible for county aid.

TUBERCULOUS APPENDICITIS

By Thomas A. Card, M.D.
Riverside

Discussion *by Philip H. Pierson, M. D., San Francisco; Emile Holman, M. D., San Francisco.*

TUBERCULOUS appendicitis was first reported and described by Corbin[1] in 1937. In 1882 Koch[2] announced to the world the discovery of the bacillus of tuberculosis, and this stirred the medical profession to a more intense study of suspected lesions.

REPORTS IN THE LITERATURE

Until May, 1937, there have been in all 151 cases reported in the literature. That this condition is relatively rare is shown in a monograph by Mueller,[3] who published reports from various clinics showing autopsy findings. I am reporting only the larger clinics of his series. Fenwick and Dodwell, in 2,000 autopsies, had a percentage of 0.8; and Kelly, reporting 3,770 cases, had a percentage of 1.2. Koster and Kosman, 1934, collected a series of tabulations from clinics showing the percentage found at operation; and again I am reporting the larger clinics, as follows:

Clinic	*Year*	*No. of Cases*	*Percentage of Cases*
Mayo	1905	1,888	1.5%
Deaver	1902–13	7,610	0.2
Montreal General	1909	12,003	1.5
Mayo	1914	1,259	0.1
Free Hospital for Women, Brookline, Mass.	1902–1932	7,665	0.1
Koster	1928–1932	3,271	0.1

These series show the relatively close relationship in the findings of autopsy and operation.

It is generally believed by authorities that tuberculous infection of the appendix occurs either through direct extension or by the hematogenous route. The hematogenous route was favored by most authors where the pathology presented involved the appendix only. In view of the fact that the cecum and appendix quite frequently have decreased peristaltic activity and it is generally recognized that active tubercle bacilli are present free in the colon, is it not conceivable that organisms may, by direct peristaltic action, be carried into the lumen of the appendix from the cecum, and there by direct apposition infect the mucous membrane of the appendix? That is illustrated in Slide 6, where the only lesion found is in the submucosa of the wall.

RIVERSIDE COUNTY HOSPITAL PROCEDURES

The attention of the surgical staff of the Riverside County Hospital was directed from time to time to patients in the tuberculosis department who were complaining of abdominal distress with localization in the right lower quadrant. Many of the findings were rather vague and not typical clinically of the more acute and positive findings of those coming in the general surgery service.

Formerly we were apt to temporize with these cases, being reluctant to operate for fear of activating the pulmonary condition. It was our custom to treat them symptomatically by fluid diet, ice bag, and observation. Many of these cases quieted down, only to have a recurrence of symptoms from a few weeks to months later. Others would rapidly, and often without marked increase of symptoms, develop a palpable mass, and at operation we would evacuate an abscess or remove a greatly inflamed and distended appendix, with involvement in some cases of the cecum and surrounding viscera. Several of the cases developed fistula and chronic discharge, with rapid dissolution and death.

More recently, therefore, we have learned to give greater consideration to those tubercular patients complaining of such mild symptoms, and we have found that earlier operations have given a much higher percentage of cures with primary healing and without appreciable damage to the pathology in the lungs.

The choice of anesthetic in all of our cases was spinal, novocain 120 to 150 milligrams, or the combination of 50 milligrams novocain and 10 milligrams pantocain being used. This has proved satisfactory in our series, inasmuch as it has given adequate anesthesia, a convalescence with a minimum of nausea and no immediate irritation of the pulmonary condition. All of our cases have been transferred either to the tuberculosis wards or to their homes at the end of ten days. Healing in all of these cases was per primum. Postoperative care was routine, including adequate fluids by subcutaneous or intravenous method, until such time as fluids could be administered orally, usually within twelve hours.

Although the condition is relatively rare, it presents a problem which heretofore has seemingly been given little consideration; due, undoubtedly, to the fact that clinical symptoms are in most cases vague, and that proper evaluation of the pathology is difficult.

I wish to report eight cases occurring in a series of 520 appendectomies in the Riverside County Hospital between January, 1933, and February 1, 1938. These cases are proved tuberculosis of the appendix without demonstrated lesions found elsewhere in the intestinal tract. The percentage in this series is 1.5. All eight cases had proved pulmonary tuberculosis, most of them in the quiescent stage; and one, as the history will show, had been dismissed from institutional care as an arrested case and returned to the general hospital fifteen months later with a diagnosis of acute appendicitis.

The following cases are briefly summarized:

REPORT OF CASES

Case 1.—G. M. Hospital No. 17559. Male. Mexican. Age, 24.

Entered hospital on March 13, 1933, with positive pulmonary tuberculosis. On June 10, 1933, he complained of abdominal cramps and diarrhea. Eleven days later he had a recurrence of symptoms and localization of pain in the right side; temperature 100, white count 15,000, polymorphonuclear 76 per cent. On June 27, 1933, he again reported abdominal cramps. Examination showed tenderness and muscle spasm of the right rectus. Temperature not elevated, white blood count 8,750, polymorphonuclear 60 per cent.

Diagnosis: Chronic appendicitis; recurrent.

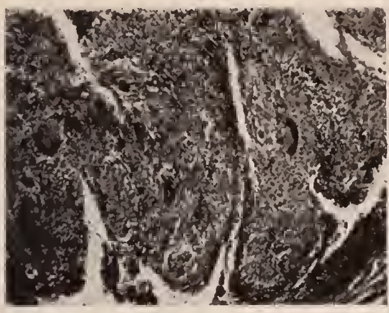

Fig. 1

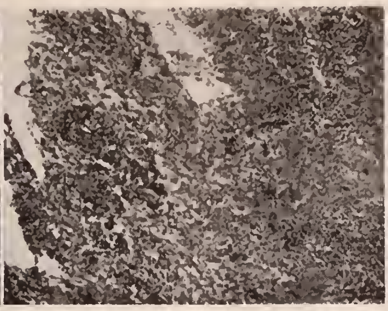

Fig. 2

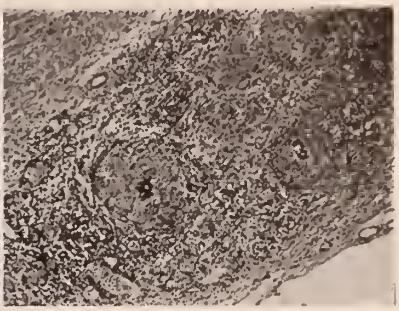

Fig. 3

Fig. 1 (Case 1).—Shows giant cells surrounded by tuberculous granular tissue.
Fig. 2 (Case 2).—Shows giant cells surrounded by tuberculous tissue.
Fig. 3 (Case 3).—Shows tubercles with a ring of inflammatory cells and giant cells, four in all.

Operation on same day, under spinal anesthesia. No evidence of visceral tuberculosis, no enlarged mesenteric lymph-nodes found. Cecum was normal in appearance, Appendix was free, involved in two definite kinks, giving a corkscrew appearance. Wall was injected and indurated.

Pathologic examination: The outer layers show perivascular, round-cell infiltration. In the lymphoid tissue there are a number of typical tubercles. The overlying mucosa in the section examined is not ulcerated. Diagnosis: Tuberculosis of the appendix.

* * *

Case 2.—C. Y. Hospital No. 20522. Female. Mexican. Age, 22.

Admitted to hospital in August, 1933, with diagnosis of pulmonary tuberculosis. She complained of rather severe pain in the right lower abdominal quadrant. Examination showed very slight tenderness over McBurney's area; no referred tenderness; no pelvic pathology. Temperature, 99.2; pulse, 90; white blood count, 11,500; polymorphonuclear, 76 per cent; urine negative.

Diagnosis: Acute appendicitis.

She was operated upon the same day, under spinal anesthesia. Appendix was distended in the terminal half and injected. There were a few grayish, white plaques over the serous coat of the appendix. There were no palpable glands at the base of the cecum.

Pathologic examination: The appendix measures 2 by 3 centimeters. The wall is greatly thickened on cut section. Microscopic examination: The mucosa is quite irregular; submucosa is infiltrated with numerous eosinophils. There is also much fibrous tissue present. There are areas revealing tubercles, consisting of giant cells and epithelial cells, surrounded by lymphocytes. Diagnosis: Tuberculosis of the appendix.

The patient made an uneventful recovery and had no further abdominal symptoms.

* * *

Case 3.—U. G. Hospital No. 21054. Female. Mexican. Age, 27.

Entered the hospital in April, 1934, with diagnosis of pulmonary tuberculosis. First complained of right-sided abdominal pain in July, 1934; temperature, 101; white blood count, 9,800; polymorphonuclear, 85 per cent. Ice bags were applied and condition quieted down. One month later the patient had a recurrence of abdominal pain, with elevation of temperature, and again ice bags were applied. Pain in the right lower quadrant persisted, and on palpation of the abdomen tenderness was noted over McBurney's area and in the pelvis. No muscle spasm was present. White blood count was 9,700; polymorphonuclear, 83 per cent. Abdominal symptoms continued and operation was done. Findings: Appendix retrocecal, six inches long, adherent, moderately injected, and edematous. There were a few small granular deposits on the serous coat of the appendix. The cemum showed no involvement and pelvic organs were apparently normal. No palpable glands were noted, appendix removed routinely without drainage.

Pathologic report: There is a deep constriction in the center of appendix. Serosa is congested. Lumen is distended by white purulent material. Microscopic: In places the mucosa and lymphoid tissue are greatly thinned apparently by pressure. There is some necrosis of the mucosa. There are many neutrophils and eosinophils in the inner layer. Much scarring of the submucosa and small groups of tubercles are present in the serosa. Diagnosis: Tuberculosis of the appendix and subacute purulent appendicitis.

The patient made a good postoperative recovery, with no further abdominal symptoms.

* * *

Case 4.—E. M. Hospital No. 21569. Male. Mexican. Age, 23.

Admitted to hospital on September 19, 1934, with a diagnosis of pulmonary tuberculosis. On February 24, 1935, he complained of pain and tenderness over McBurney's area. He reported a similar attack seven months before. Morning temperature was 98; evening temperature, 99.4; pulse, 90.

Examination, February 25, 1935, showed muscle spasm of right rectus, with localization of tenderness over McBurney's area. White blood count, 12,400; polymorphonuclear, 92 per cent. Diagnosis: Chronic appendicitis.

Operation: Some clear serum was found in abdominal cavity. Appendix was found clubbed at terminal portion,

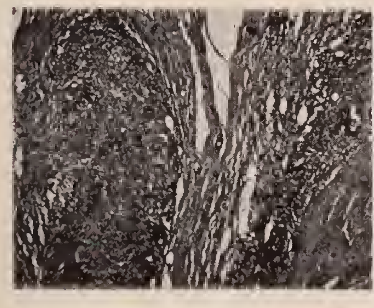

Fig. 4

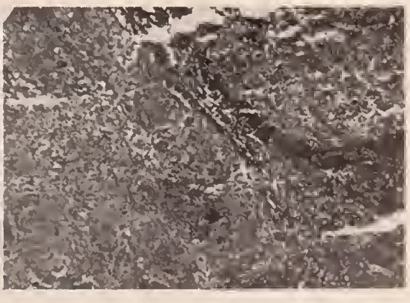

Fig. 6

Fig. 4 (Case 4).—Large tubercles with a great amount of caseous matter and giant cells.
Fig. 5 (Case 5).—Four tubercles with giant cells in central part of slide.
Fig. 6 (Case 6).—Shows definite tubercle formation with giant cells.

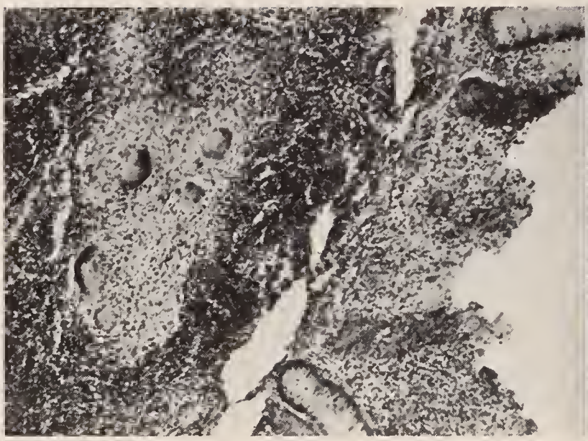

Fig. 7

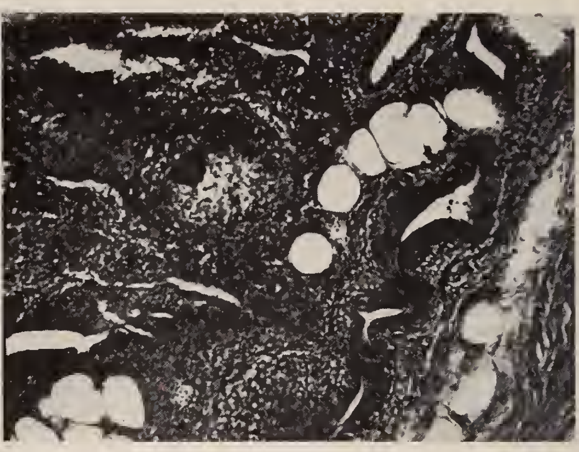

Fig. 8

Fig. 7 (Case 7).—Shows mucous membrane crypts. Large tubercles in lymphoid tissue with five giant cells.
Fig. 8 (Case 8).—Shows large tubercle with giant cells.

injected and indurated. There were a few pearl-like bodies in the serosa of the appendix. Cecum was not involved in inflammatory condition, no palpable glands noted.

Pathologic report: Gross appendix, 4.5 centimeters long; serosa is roughened, apparently by adhesions. Microscopic: At the distal end of the appendix there is a large caseous area, surrounded by a thin fibrous capsule. Tubercles are found in the mucosa and submucosa of the appendix. The lumen of the appendix and the mucosa contain some purulent exudate. Diagnosis: Tuberculosis of the appendix.

Postoperative course was uneventful, with primary healing. No further abdominal symptoms.

* * *

Case 5.—T. L. Hospital No. 33158. Female. Mexican. Age, 17.

Admitted to the hospital on July 28, 1938, with a diagnosis of pulmonary tuberculosis. On April 8, 1937, she complained of severe pain in the right lower quadrant of the abdomen. There were no positive abdominal findings. Temperature was 98; pulse, 80; white blood count, 12,900; polymorphonuclear, 76 per cent. On May 7, 1937, she complained of pain in right lower quadrant for one day only. There was no further abdominal distress until February 8, 1938, at which time she complained of pain in the right lower quadrant, no rigidity found. There was some tenderness over McBurney's area, with no rise in temperature, no nausea or vomiting. White blood count was 12,000, polymorphonuclear, 60 per cent; lymphocytes, 31 per cent. Five days later she still had pain; there was slight rectus rigidity with referred tenderness, no temperature elevation. White blood count was found to be 19,000. Preoperative diagnosis was probable tuberculous appendicitis.

Operation, February 14, 1938. Appendix was slightly elongated and distended, moderately injected. Cecum and adjacent small bowel were carefully inspected, but no pathology was found. Mesenteric lymph-nodes were not enlarged.

Pathologic report: Gross specimen is an appendix measuring 8 by 1.3 centimeters, with much adherent fat. The serosa is thickened. The wall is up to 4 millimeters thick. The lumen contains coagulated white material. Microscopic: The subserosa is infiltrated by many round cells and plasma cells. The muscularis contains many such cells and is edematous. The lymphoid tissue contains many tubercles. Diagnosis: Tuberculous appendicitis.

The patient made an uneventful recovery.

* * *

Case 6.—R. C. Hospital No. 36993. Female. Mexican. Age, 16.

Admitted to hospital on August 5, 1937, with a diagnosis of pulmonary tuberculosis. On January 29, 1938, she first complained of slight pain in the right lower quadrant. On February 4 she again complained of pain in her right side. No rigidity of the right rectus, but there was some tenderness on deep pressure over McBurney's area. White blood count, 19,200; polymorphonuclear, 85 per cent; temperature, 98. The next day the white blood count was 18,400. Because of the clinical evidence, a diagnosis of tuberculous appendicitis was made and she was operated.

Findings: Appendix located normally, somewhat twisted on itself, with many adhesions between the meso-appendix and the cecum. Examination of the adjacent organs was entirely negative for any other pathology.

Pathologic report: Microscopic, the appendix appears quite normal, except for a collection of small epithelial tubercles in the submucous lymphoid tissue. Some of these contain Langhans' giant cells. Diagnosis: Tuberculosis of the appendix.

The patient made an uneventful recovery.

* * *

Case 7.—A. S. Hospital No. 37247. Female. Mexican. Age, 17.

Entered the hospital with a diagnosis of pulmonary tuberculosis on August 31, 1937. On September 29, 1937, she complained of nausea, later associated with vomiting, but no abdominal pain. On January 23, 1938, she complained of pain and tenderness in the right lower quadrant. Temperature was not elevated, pulse 100. White blood count 16,000, with polymorphonuclear count of 67 per cent. Examination showed no spasticity or evidence of muscle rigidity. Tenderness over this region was slight. Morning temperature 97.8, pulse 90. At this time the white count was 12,500, with 85 per cent polymorphonuclear.

On February 5 she had a pneumothorax of 300 cubic centimeters, with temperature of 99.2 following; pulse 110. At this time she complained of a recurrence of pain in the right lower quadrant. There was increased muscle spasm and definite localization of pathology. Preoperative diagnosis: Subacute appendicitis, with possible tuberculous appendix.

Operation: The cecum and appendix were found and removed from the abdomen. The tip of the appendix was markedly injected and slightly swollen. There were no enlarged mesenteric glands found and no tubercles on the cecum. The uterus, ovaries, and tubes were all found to be normal. The abdomen was closed in layers in the usual manner.

Pathologic report: Section from appendix shows definite group of tubercles in the lymphoid tissue at one side of the appendix. The tubercles have the appearance of having developed rather rapidly. Diagnosis: Tuberculosis of the appendix.

Patient made an uneventful recovery and had primary healing of the wound.

* * *

Case 8.—C. L. Hospital No. 31706. Female. Mexican. Age, 18.

Admitted to hospital on February 7, 1938, with a diagnosis of acute appendicitis. She had been a patient in the tuberculosis hospital from September 30, 1935, to July 10, 1937. Present symptoms were sudden onset of pain in right lower quadrant, slight at first but becoming more severe and frequent. White blood count on admission was 12,550, with 73 per cent polymorphonuclear, temperature 99, and pulse 100. The patient stated that she had had no previous attacks of similar abdominal pains.

She was operated the following day. There were numerous adhesions around the entire appendix, it being bound firmly to the cecum, moderately injected and somewhat swollen and indurated. There were several fine, white plaques on the appendix. The cecum adjacent to the appendix was injected moderately. No mesenteric glands found; ovaries, tubes, and uterus were normal to palpation.

Pathologic report, microscopic: All the coats are moderately infiltrated with round cells and a few polymorphonuclears and eosinophils. In the muscularis and mucosa are numerous tubercles. Diagnosis: Tuberculous appendicitis.

The patient made an uneventful recovery.

COMMENT

In reviewing these cases one notes that all have had tuberculosis of the lungs, that most of them were in a quiescent phase, that careful history revealed one or more previous attacks of low-grade abdominal pain, with localization in the right lower quadrant. White blood counts and temperature reactions have been, for the most part, little disturbed above normal, even in those cases that gave rather pronounced clinical findings. All have shown gross pathological changes and all have had tubercles present in various layers of the appendix. Operation in these cases have all been satisfactory, as noted by the prompt healing, and convalescence and absence of further abdominal distress.

Death from advanced pulmonary tuberculosis in the first four cases cannot, we think, be directly attributable to the operations, inasmuch as there were no exacerbations of the pulmonary lesions immediately after operation, and death occurred many months later. In our later cases we attached greater significance to mild, right side, localized tenderness, and suspecting tuberculosis of the appendix we operated early.

I believe this procedure, as outlined, will lessen the danger of later extensive appendiceal abscess formation and cecal involvement. Tuberculous appendicitis occurring secondary to infection elsewhere in the body would seem, in our experience, to be less rare than the literature suggests; and the medical profession, particularly those in charge of our tuberculosis hospitals, should keep in mind this complication and be on the alert to seek early surgical care.

Pathological reports were made through the pathological laboratory of the School of Medical Evangelists, Loma Linda, Dr. Oran I. Cutler, Chief.

SUMMARY

1. Tuberculous appendicitis is reported 151 times in the literature to May, 1937, and eight more cases are added in this report.

2. Clinical course of the disease tends to chronicity, with recurrent attacks usually milder than the pyogenic types of appendicitis.

3. Eight cases are briefly summarized and microscopic sections shown of the involved appendix.

4. Earlier recognition by the physician should be made.

5. Early operation, with removal of involved appendix, will reduce the morbidity and mortality in our tuberculosis sanitaria.

DISCUSSION

Philip H. Pierson, M. D. (490 Post Street, San Francisco).—The subject presented by Doctor Card is very timely. Many patients with pulmonary tuberculosis have tuberculosis of the intestine which may give no clinical symptoms, yet be present on x-ray examination. It is interesting, in view of the frequency of tuberculous enteritis chiefly located in the ileocecal region, that tuberculous appendicitis is so relatively rare. Doctor Card's cases surprised me somewhat in that there was so little involvement of the ileocolic glands. Very frequently tuberculosis in these glands, with no involvement of the appendix, causes all the symptoms of tuberculous appendicitis.

I agree with Doctor Card perfectly in regard to the surgical treatment of this condition. Localized ulcerative lesions in the ileocecal region very frequently respond to ultra-violet irradiation with a complete cure.

I think that it is wise at this time to stress the value of the x-ray in diagnosing these lesions. By early recognition and treatment the patient's pulmonary condition improves much more rapidly. We have recently seen, at Stanford Hospital, a patient with coccidioides of the appendix. As the symptomatology and pathology are so similar to that of tuberculosis this should be kept in mind, particularly in those regions where coccidioides is prevalent.

⁂

Emile Holman, M. D. (Stanford University Hospital, San Francisco).—Tuberculosis of the appendix is not unexpected in the presence of symptoms referable to the right lower quadrant appearing in a patient harboring also a known pulmonary tuberculosis. Its occurrence, however, as the only known tuberculous lesion is most uncommon, but apparently does occur. In a patient upon whom we were about to perform a cholecystectomy for gallstones, I once delivered an indurated, obviously diseased appendix, which, so far as anyone knew, had not been responsible for the patient's symptoms. Microscopically, the appendix showed typically tuberculous lesions. No other focus of tuberculosis could be demonstrated, either in the abdomen or in the lungs.

In California there exists another lesion of the appendix which is easily mistaken for tuberculosis. A young Filipino, who had resided for a short time in the San Joaquin Valley, was recently operated upon for rather severe lower right quadrant symptoms which seemed easily explained, at operation, upon the basis of tuberculosis. Numerous tubercles studded the peritoneum overlying the cecum and the parietal peritoneum around the appendix, which was indurated and inflamed and, therefore, removed. The pathologist's first report confirmed the operator's impression that the lesion was tuberculous. Further study, however, revealed the typical spheroid bodies of coccidiodes.

Doctor Card is to be congratulated upon the primary healing that occurred in these eight tuberculous lesions of the appendix. His admonition to operate when right lower quadrant symptoms first arise, is, I believe, well warranted, in the hope that the lesion may still be limited to the appendix. Fistulae, localized peritonitis, and subsequent intestinal obstruction occasionally complicate the removal of the more advanced lesions seemingly limited to the appendix, but probably already involving the cecum. It is possible that the early removal of the tuberculous appendix will prevent the subsequent extension of the tuberculous process to the cecum.

TRAUMATIC DIAPHRAGMATIC HERNIA: TRANSPLEURAL REPAIR*

By H. E. Schiffbauer, M.D.
Los Angeles

Discussion *by Charles Eaton Phillips, M. D., Los Angeles; Emile Holman, M. D., San Francisco.*

In this paper I shall discuss and report eight cases † of traumatic diaphragmatic hernia which I have operated upon since October, 1935, by the transpleural approach, with recovery.

Diaphragmatic hernia can be divided into two groups: (1) nontraumatic; (2) traumatic. The nontraumatic are subdivided into congenital and acquired. Hedblom, in an analysis of 378 operated cases, found that two-thirds were of traumatic origin; one-sixth congenital and one-sixth acquired.

With the increase of injuries resulting from automobile accidents, the incidence of traumatic rupture of the diaphragm has increased.

TRAUMATIC HERNIA

Traumatic hernia may result from direct or indirect injury. Direct injuries to the diaphragm resulting from penetrating wounds, such as stab or gunshot, impalements and punctures from fractured ribs, are often accompanied by injuries to the lungs, liver, stomach, spleen, and kidneys.

Instances are reported of the rupture of the diaphragm during labor, vomiting, heavy lifting, and having the lower chest and upper abdomen crushed while wrestling. Rupture of the diaphragm has occurred in divers jumping from great heights and landing on their abdomen, also in persons jumping from a window and landing on their feet.

Rupture of the diaphragm has resulted from severe crushing injuries to the chest, with or without fractures. Fractures of the transverse processes of the upper lumbar vertebrae may also be a contributing factor.

Weakening of the diaphragm has resulted from a stiff rubber tube improperly placed in draining an empyema, causing an erosion of the diaphragm and a weakness of the muscle. With a sudden increase in the intrathoracic pressure, a tear occurs and a hernia develops.

A complete repair of the tear in the diaphragm will take place, provided no viscus intervenes between the edges of the torn muscle.

It was noted in the eight cases that the tear was parallel to the muscle fibers, extending from the anterolateral attachment of the diaphragm to the region of the esophageal hiatus. It is quite possible that the tear began at the central tendon in the dome of the diaphragm and extended anteriorly and posteriorly.

PATHOLOGY

No hernial sac was found in any of the eight cases. The formation of a sac depends upon the size and location of the defect in the diaphragm, and the rapidity with which the abdominal viscera enter through the defect. It is not infrequently seen in puncture wounds of the diaphragm, which develop a herniation into the pleural cavity years after the injury.

When a defect in the diaphragm exists, the intra-abdominal pressure associated with the continuous suction action of the diaphragm gradually increases the amount of the abdominal viscera in the chest. The viscera found in the pleural cavity depends upon the size and location of the tear in the diaphragm, and the rapidity with which the viscera enters immediately after injury.

In none of the cases was there any fluid, or bloodclots in the pleural cavity, and no adhesion between the lung and abdominal viscera. In two cases the lower lobe of the lung was adherent to the anterolateral chest wall by a cord-like bands. In all cases the lower lobe was more or less atelectatic; in one case the upper lobe was also partially airless. The lung was completely reëxpanded in all cases, without any ill effects from the reëxpansion.

SYMPTOMS

A paucity of clearly defined symptoms referable to the thorax and abdomen is characteristic in traumatic rupture of the diaphragm.

It is necessary to consider the symptoms arising from the acute and chronic case, and the chronic case which has become acute.

Acute Cases:

When the patient has been severely injured, there are many symptoms and conditions which make it comparatively easy to overlook a tear in the diaphragm, especially when it has been effectively plugged by the stomach, and on examination of the thorax the characteristic signs are absent or difficult to recognize.

It is then important to decide if a perforation of the abdominal viscera, an acute hemorrhage or an incarceration of the intestine exists, with a rupture of the diaphragm.

Chronic Cases:

Atypical and vague gastro-intestinal symptoms in the left hypochondrium, often associated with indefinite pleuritic pain, and a history of injury to the upper abdomen and lower chest, should demand a critical study by a roentgenologist.

Peritoneoscopic examination might be considered in making a diagnosis in obscure chronic cases with indefinite thoracic and abdominal symptoms.

Chronic Cases Which Have Become Acute:

The most common symptom is the sudden onset of severe colicky pain in the hypochondriac region, which is often referred to the neck, shoulder region and anterior lower chest, followed by nausea and persistent vomiting with a disturbance of bowel movements.

The characteristic symptoms of abdominal viscera in the pleural cavity may be absent.

A flat plate of the abdomen and lower chest will often aid in making a diagnosis of incarceration of intestinal viscera in a tear of the diaphragm.

---

* Read before the General Surgery Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9–12, 1938.

† Only two case reports appear in this issue. Others will be given in the reprints.

PHYSICAL FINDINGS OF THE CHEST

Inspection:

There may be no laceration, contusion, subcutaneous emphysema or evidence of injury to the chest wall or upper abdomen.

The prominence of the chest findings depends upon the kind, amount, distribution and detention of the abdominal viscera, and the rapidity with which they entered the pleural cavity after the tear in the diaphragm, and if a complete pneumothorax resulting from the injury to the lung exists.

Therefore, it is obvious that in some patients dyspnea and cyanosis, with shallow respiration and a lagging of one side of the chest, are the outstanding symptoms, while in others these are absent.

A bulging of the hypochondriac region may be present.

The abdomen is usually scaphoid and often less prominent.

Palpation:

Subcutaneous emphysema, a hematoma and crepitation over the fractured ribs may be elicited. The apex of the heart is usually displaced to the right. Abnormal fremitus is often present. The abdominal muscles are usually rigid.

Percussion:

Normal resonance is displaced by tympany over the anterior chest and the degree of dulness, posteriorly, depends upon the amount of fluid present and the extent of atelectasis.

The tympanic sounds may be caused by a pneumothorax, and cannot be differentiated by percussion from abdominal viscera in the pleural cavity.

Auscultation:

The heart sounds are distant and displaced to the right. Normal breath sounds are decreased or absent, depending upon the amount and distention of the abdominal viscera in the pleural cavity and the presence of a pneumothorax.

Hearing peristaltic contraction over the chest is pathognomonic of intestinal organs in the pleural cavity. The shifting of the patient and listening for many minutes may be necessary before peristalsis is heard.

Gurgling is readily demonstrated over the anterior chest, in the fourth or fifth interspace, by having the patient take liquids in a sitting position.

This auscultatory finding can be accentuated by the administration of an effervescent powder. The application of the powder may be of value during a fluoroscopic examination when a pneumothorax exists, with a ruptured diaphragm.

Any gurgling, splashing or rumbling sound in the chest should be carefully investigated.

The routine fluoroscopic and x-ray examination will often fail to detect a rupture of the diaphragm.

DIAGNOSIS

Kirkin [1] states that the chief obstacle to the diagnosis of a diaphragmatic hernia is the neglect to look for it.

It is often extremely difficult to make an early diagnosis of traumatic diaphragmatic hernia because of the severe concomitant injuries and the bizarre, vague chest and abdominal symptoms. It is my impression that in many cases when the tear in the diaphragm is small, the fundus of the stomach plugs the opening immediately after the injury and prevents the early thoracic symptoms. Later the stomach, along with other movable viscera, may be drawn into the chest, producing the characteristic thoracic symptoms.

A critical study of all such injured persons should be made.

TREATMENT

Keen and experienced judgment is required to decide whether or not to operate upon an acute diaphragmatic rupture when a diagnosis has been made shortly after the injury. In serious injuries to the abdomen, a perforation of the hollow viscus, hemorrhage or incarceration, must always be considered. After observation over a period of hours, if the clinical picture suggests a possibility of any serious intra-abdominal lesion, an exploratory laparotomy should be done. If the patient is in an extremely serious condition, it might be advisable only to control the hemorrhage, repair the perforated viscus or relieve the incarceration, but not repair the rent in the diaphragm. The additional surgery may be too much for the patient to tolerate, but he can survive with a tear in his diaphragm, which can be repaired at a later date.

If intra-abdominal injury can be excluded, it is advisable to institute conservative treatment until such time as the patient is a good operative risk. However, the earlier surgery can be done the less difficulty will be encountered. Chronic cases which become acute should be operated upon at once, by the abdominal route. A supraclavicular temporary phrenic interruption is optional immediately before the laparotomy; nasal gastric lavage should always be done prior to surgery, leaving the tube in the stomach during and after surgery.

In chronic cases, transpleural approach offers many advantages over the abdominal route:

1. Adequate exposure is readily obtained.
2. The phrenic nerve may be crushed or injected with novocain as it enters the diaphragm, which insures an early return of function. After the hernial opening is exposed, it may not be advisable to interrupt the phrenic nerve, where in the abdominal method this must be done before surgery. This is an advantage.
3. Adhesions of the abdominal viscera to the lung or chest wall can be severed by sharp dissection under direct vision.
4. The atelectatic lung can be properly reexpanded by positive pressure under direct vision.
5. If necessary, a fascia lata transplant with living fascial sutures can easily be done, with a decrease in circumference of the chest by multiple rib resection, if necessary.

When difficulty is encountered, by either the abdominal or transpleural approach, it is advisable to combine both methods. The operator should be familiar with each method, and the anesthetist capable of giving positive pressure anesthesia.

PREOPERATIVE TREATMENT IN CHRONIC CASES

In the chronic case it is advisable to give the patient a nonresidual diet of high caloric value, with an adequate amount of liquids for the dehydrated patient.

A blood transfusion should be given when the patient is anemic or has a low blood pressure. The evening before the operation a thorough gastric lavage should be done, to be repeated before going to surgery, leaving the intranasal Levine tube in the stomach. When a distended transverse colon is in the pleural cavity, a high rectal tube should be inserted.

ANESTHETIC

Avertin, 70 to 90 minims per kilo body weight, supplemented with nitrous oxid and oxygen, under 10 to 14 millimeters of mercury with positive pressure, was satisfactorily used in three cases. In one case—that of a twelve-year-old boy—only nitrous oxid was used, with good results. In one case it was thought advisable to use ethylene. In three cases, cyclopropane, given by the intratracheal method, was used to an advantage. The operative procedure is made less difficult with this type of an anesthetic.

I have come to the conclusion, in reference to anesthesia, that the most important factor is not the kind of anesthetic agent and mode of administration, but the anesthetist giving the anesthetic.

TECHNIQUE OF THE TRANSPLEURAL OPERATION

The patient is placed on the operating table on his good side, resting on a sand bag or folded blanket under the midaxillary portion of his chest.

The incision begins just lateral to the costal attachment of the ribs in the eighth interspace, and continues backward, parallel to the ribs to their angles. The pleural cavity is opened the entire length of the incision.

Upon opening the pleural cavity, in chronic cases, few changes take place in the patient's general condition because the mediastinum has been stabilized and the structures have compensated for the altered conditions within the affected pleural cavity.

To enlarge the opening in the pleural cavity, the eighth and ninth ribs are cut between two punched holes about two centimeters apart, just lateral to the angle of the ribs. After protecting the wound edges with gauze pads, self-retaining retractors are inserted at the upper and lower angles of the incision, and the wound is widely separated.

If, on exploration, the colon is markedly dilated and more than the usual amount of difficulty is encountered in deflating the colon, the possibility of a growth in the distal portion of the colon should be considered; and, if found, a cecostomy with immediate decompression technique is advisable.

The stomach should be examined for pyloric stenosis, ulcer, malignancy, and a volvulus. I failed to recognize the volvulus in the first case, necessitating an abdominal operation for its correction. This condition could have been easily repaired at the first operation, if it had been recognized.

The phrenic nerve is readily seen at its entrance into the diaphragm and easily crushed with a forceps, producing a temporary paralysis of the diaphragm, which facilitates the reduction of the abdominal viscera and the repair of the hernial opening.

The phrenic interruption may not be necessary in all cases. The adherent abdominal viscera are separated from their attachment to the lung and inner chest wall by sharp dissection. Structures are always adherent to the margins of the hernial opening; these are loosened, and if necessary the opening in the diaphragm enlarged, which makes the reduction of the abdominal viscera easier and allows for an exploration below the diaphragm, which should be done in all cases.

After the edges of the diaphragm have been denuded, they are approximated, without tension, with interrupted black silk sutures. If the defect in the diaphragm cannot be closed without tension, a fascia lata transplant, using fascial sutures, can readily be used to fill the defect.

In the eight cases it was interesting to note the gradual expansion of the atelectatic lung after the abdominal viscera had been replaced. In the one case where the accident had occurred ten years previously, the atelectatic lung was gradually but completely reëxpanded by an increase of positive pressure through the tracheal catheter.

Before closure of the pleural cavity the sectioned ribs are approximated with kangaroo tendon. The opening in the pleural cavity is closed by placing interrupted No. 1 chromic sutures around the ribs, above and below the intercostal opening. The muscles and fascia are approximated in their anatomical planes with No. 1 chromic sutures. The pleural cavity is not drained.

POSTOPERATIVE TREATMENT

No unusual postoperative treatment is necessary, excepting that the intranasal Levine tube should be left in the stomach and connected with a constant suction apparatus for forty-eight to seventy-two hours, to prevent a gastric dilatation.

If only a small amount of fluid collects in the pleural cavity, it should not be aspirated.

CONCLUSIONS

Eight cases of traumatic diaphragmatic hernia have been reported, seven males and one female, ranging in age from twelve to fifty-seven years, in which four early and four late diagnoses were made, varying from a few months to ten years.

Earlier diagnoses will be made when the physicians become familiar with the symptoms resulting from a diaphragmatic hernia, and the roentgenologist makes a critical study of cases receiving direct and indirect injuries to the lower chest and upper abdomen, where vague and not clearly explainable thoracic and abdominal symptoms exist.

The earlier the patient can be operated, consistent with safety, the better.

If it is necessary to explore the abdomen shortly after an injury, and a diaphragmatic tear is found but effectively plugged by the stomach, it is advisable to do the urgent surgery and leave the repair of the diaphragm for a second operation.

The transpleural repair after a temporary phrenic interruption, using intratracheal cyclopropane anesthesia under positive pressure, is the method of choice in operating upon the chronic case of traumatic rupture of the diaphragm.

REPORT OF CASES

Case 1.—Mexican, age 30, injured in an automobile accident on May 10, 1935. Admitted to hospital in a comatose condition, suffering from cerebral concussion, acute alcoholism, and left lower chest injury.

Roentgenograms on May 11 revealed a fracture of the tenth and eleventh ribs posteriorly, without material displacement. No unusual findings in the chest. A small comminuted fracture of the left iliac bone was noted. The patient was discharged from the hospital on May 18, 1935. Because of gastro-intestinal symptoms which were present since the accident, he was given an appointment in the medical out-patient clinc.

He reported to the clinic on May 22, 1935, complaining of diffuse epigastric colicky pain, dyspnea upon exertion, and a nonproductive cough. These symptoms had developed since the accident. A hyper-resonance with decreased breath sounds, and a few crepitant râles at the apex were noted, and a tentative diagnosis of pulmonary tuberculosis was made.

Roentgenograms on May 23 showed a partial pneumothorax, involving the lower left lobe of the lung with a fluid level extending to the sixth interspace anteriorly.

On June 22, 1935, on fluoroscopic examination it was noted that the fluid had disappeared and a high, not well-defined diaphragm, with a deformity of the left dome, aroused suspicion, and upon the administration of barium, the cardiac end of the stomach was seen at the level of the seventh rib posteriorly. A diagnosis by the roentgenologist, of traumatic rupture of the diaphragm, was suggested. On September 15, 1935, he was readmitted to the hospital, complaining of distress in the epigastrium, nausea after eating, and dyspnea upon exertion, since the accident in May, 1935. The barium meal and barium enema revealed that the stomach and colon were in the left chest. A transpleural approach was made through the eighth interspace, under ethylene anesthesia and positive pressure. The entire stomach, transverse colon, spleen, and a portion of the small intestine were in the left pleural cavity. The lower lobe of the lung was atelectatic.

The rent in the diaphragm was about 16 centimeters long, extending obliquely backward from the anterolateral attachment of the diaphragm over its dome to the esophageal hiatus. After crushing the phrenic nerve the viscera were dissected from the margins of the tear in the diaphragm and the abdominal structures replaced into the abdomen and the rent repaired with interrupted silk sutures.

The intercostal wound was closed by placing chromic sutures around the rib above and below the incision, with a continuous chromic suture for the muscle and fascia. Convalescence was delayed by wound infection and a small empyema which healed after adequate drainage was established.

Three months after surgery the patient complained of epigastric distress after meals. He stated that he felt a fullness under his left ribs after eating and that, by bending over and massaging the upper left abdomen, he could feel the food pass into the lower portion of the stomach.

Roentgenological examination with a barium meal revealed a ruminating type of stomach. His condition did not improve with medication and dietetic management. The abdomen was opened through a left rectus incision. A short dense band of adhesions was found, extending from the greater curvature of the stomach at its upper third, to the posterior portion of the scar in the diaphragm, rotating the upper portion of the stomach on itself. After severing this band the stomach assumed a normal position. The previous rent in the diaphragm was visible and firmly healed. Upon subsequent examination the patient was in excellent health and free of complaints.

The second operation could have been obviated if a more thorough examination had been made during the first operation.

* * *

Case 2.—Male, age 30. On October 19, 1931, was in an automobile accident, receiving injuries to the head, left chest, and lower back.

Roentgenograms on October 20, 1931, disclosed a fracture of the seventh rib in midaxillary line, with no material displacement; a fracture of the superior and inferior rami of the left pubic bone; fracture of the left acetabulum, with some inward displacement; fracture of the first and second sacral segment on the left side. No abnormal findings in the chest. Discharged from hospital on December 29, 1931.

At intervals, from January 7 to October 27, 1932, the patient was seen in the orthopedic clinic. No reference to chest.

In April, 1935, he fell off the running board of a car, striking his head. He was dizzy, with blurred vision and headaches. Diagnosis: Concussion. X-ray examination showed no skull fracture.

On October, 1935, chest was examined; impaired resonance in left apex with fine râles present. Diagnosis was made of pulmonary tuberculosis early, and he was sent to the tuberculosis clinic.

X-ray of October 3, 1935, showed hydropneumothorax, with fluid level at eighth interspace near posterior axillary line. Slight collapse of left lung; evidence of thickened pleura in interlobar fissure.

On July 29, 1936, x-ray showed diaphragm level third interspace, anterior. Stomach lies immediately under diaphragm medially and anteriorly. Diaphragm is terraced from anterior to posterior, so that it is at eighth rib anterior. There are loops of small intestine laterally and posteriorly to the stomach and beneath the diaphragm. The barium entered the stomach readily and emptied into the duodenum normally. The left diaphragm was slightly movable. The findings were consistent with those of a diaphragmatic hernia.

On August 5, 1936, the patient was operated upon by the transpleural approach. On opening the pleural cavity the entire stomach, transverse colon, about 20 centimeters of small intestine, and the spleen were in the pleural cavity. The lower lobe of the lung was atelectatic.

The tear in the diaphragm began at its anterolateral attachment and extended backward toward the esophageal hiatus. The tear was repaired with interrupted silk after the abdominal viscera were replaced into the abdomen.

A pleural effusion occurred postoperatively, and was gradually absorbed without any complications.

On October 13, 1936, the x-ray showed the stomach in normal position, below the diaphragm.

DISCUSSION

Charles Eaton Phillips, M. D. (2007 Wilshire Boulevard, Los Angeles).—Doctor Schiffbauer has given us a comprehensive treatise on the transthoracic repair of diaphragmatic hernia. But there are a few points in the surgical treatment of diaphragmatic hernia which should be accentuated.

First: The diagnosis of diaphragmatic hernia may offer many difficulties. A majority of the cases are not recognized until the condition has become well developed. Many are not found or even suspected until they are found at autopsy. Diaphragmatic hernia, like others, develop in points of congenital weakness, except those which follow direct traumatism such as from drainage tubes, wounds of the diaphragm, etc. A great majority are well developed when some sudden strain brings on an acute exaccerbation, and this leads to their discovery.

Even the exploratory operation may fail to reveal its presence unless there is x-ray evidence to guide the examination.

The mere presence of a diaphragmatic hernia is consistent with a normal span of life and activity.

It becomes a surgical emergency only in the rare cases where it is complicated by acute displacement of the stomach or other viscera, and possible strangulation.

The surgical relief of the condition has had the advocates who favored the abdominal, and others who have preferred the transthoracic approach. Each has had its technical difficulties and its advantages. Both approaches are formidable procedures which require skill and special instruments in their performance.

For the past ten years I have employed an approach which has presented certain advantages over either the classic thoracic or abdominal incisions.

Operation: A left paramedian incision is made, severing the seventh costal cartilage and extending downward to the level of the umbilicus. A careful exploratory is then performed. From the upper end of this incision the opening is continued outward and downward along the attachment of the diaphragm for a distance of eight inches. This flap is then turned outward and downward, leaving a triangular opening with the diaphragm edge presenting. It gives ready access to both sides of the diaphragm and at the same time perfect exposure to the structures, such as the splenic pedicle and vessels which may be injured in either of the other approaches.

Separation of adherent viscera and ligation of all bleeding points, and replacement of viscera, can be accomplished with certainty. Closure of the defect is simple and is usually accomplished with two or three rows of a forty-day chromic gut.

After the diaphragm has been repaired the costochondral flap is replaced and the cut edge of the diaphragm is included in the running chromic stitch which closes the lateral prolongation of the incision.

The paramedian incision is then closed in the same manner, completing the operation. Even in difficult cases the time of operation should not take more than thirty minutes. No subsequent trouble has been encountered with the fracture of the costochondral flap. No special instruments are necessary.

In the presence of adherent viscera it furnishes the ideal approach.

Many cases are not surgical. Surgery may be contraindicated by age, physical condition, or personal preference. In these, great relief may sometimes be obtained by increasing the intrathoracic pressure. These patients may develop a certain emphysema by blowing rubber balloons two or three times a day. The improvement, following this simple procedure, has been startling in some cases.

⁂

Emile Holman, M. D. (Stanford University Hospital, San Francisco).—Doctor Schiffbauer has very ably and very completely covered the subject of diaphragmatic hernia due to trauma. Physicians generally, and industrial and traumatic surgeons in particular, will do well to bear in mind the possibility of such a hernia incident to any severe trauma to abdomen or to chest. If a diagnosis of hernia through the diaphragm is made, and if abdominal symptoms predominate, the abdominal approach is indicated, preferably through a long incision parallel to the costal margin extending through the linea alba medially and to the anterior axillary line laterally. An excellent exposure of the diaphragm is obtained, and after reduction of the hernial mass it is sometimes possible to identify and crush the phrenic nerve through the rent, if this is deemed necessary to approximate the edges of the rent.

Occasionally, in the abdominal approach, it is difficult to withdraw the abdominal viscera through the rent because of the negative pressure in the thoracic cavity. This can be simply overcome by the passage of a small catheter through the rent alongside the herniated mass, and by the introduction through it of air into the thoracic cavity above the diaphragm, thus equalizing the pressures in the two cavities.

VITAMIN-DEFICIENCY STATES: THEIR RECOGNITION AND TREATMENT*

By Dwight L. Wilbur, M.D.
San Francisco

PART I

The concept that disease may be due to deficiency of vitamins has received such widespread proof, and has been so universally accepted, that our clinical interest must now turn to means of recognizing and treating vitamin-deficiency states as well as to a study of the events leading to development of them. The importance of establishing these points lies principally in the fact that vitamin-deficiency states are an unusual group of diseases in that they can be entirely prevented and that, with the exception of a few extreme instances, they are completely amenable to cure.

CHARACTER OF DEFICIENCY STATES

For purposes of a clearer understanding of deficiency diseases and the difficulties surrounding recognition of them, such a simple grouping as that presented in Table 1 is of considerable value. In the first group are those patients who, with a marked degree of deficiency, present a classical deficiency disease, as xerophthalmia, beriberi, or pellagra. Such a condition depends on definite pathologic changes in the tissues, it can be recognized by clinical means without recourse to special tests, and it is infrequently encountered in this country.

In a second group may be placed those diseases which are usually due to a moderate degree of deficiency, such as the multiple neuritis of chronic alcoholism, nutritional night blindness, certain types of macrocytic anemia and glossitis. In these cases the deficiency is less marked than in the cases of the preceding group, the symptoms depend on physiologic and pathologic changes, and the diagnosis may rely on the use of special diagnostic tests.

In many respects the sequence of events in these two groups of "deficiency states" may be likened to those occurring in patients with diabetes, nephritis or cardiac disease. Patients with a marked degree of vitamin deficiency may be said to be analogous to diabetic or nephritic patients who are in coma, or to cardiac patients who are decompensated and in whom the pathologic changes are extensive and the diagnosis may be made by clinical means alone. Patients with less marked degrees of deficiency, in whom the pathologic changes are less obvious but the physiologic ones very definite, may be considered analogous to patients with definite diabetes, nephritis or heart disease, in whom the symptoms may depend as much on physiologic as on pathologic changes, and in which special tests may or may not be required before a diagnosis can be established. The frequency with which deficiency disease of moderate degree occurs has not been clearly established, but these conditions are apparently common enough to be encountered by most physicians at fairly regular intervals, and to constitute at present the usual case of vitamin deficiency disease.

In a third group may be placed those conditions in which the deficiency is mild and in which recognition of the deficiency may be said principally to depend upon physiologic or chemical alterations rather than on pathologic ones. In fact, recognition of this group of cases in which clinical changes are often absent has depended on the development of special tests, such as the biophotometric determination of dark adaption of the eyes in vitamin A deficiency and the chemical measurement of the saturation of the tissues with vitamin C. The clinical significance of this group of "deficiency states" has not been settled. To carry further the previously mentioned analogy, one might say that this group corresponds to those diabetics in which the diagnosis can be made only after careful studies of the tolerance to dextrose, or with those nephritics who do not present clinical signs of renal

---

* Read before the Pediatric Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

Mild	Absent? Preclinical?	Physiologic	Common	Laboratory tests

disease and in whom the diagnosis depends on careful study of the urinary sediment or of the ability to concentrate urine.

It seems probable that deficiency states falling into the third group will prove to be quite common. However, until much more evidence has accumulated in regard to the physiologic activity of the vitamins, until there are clear-cut methods of determining the chemical concentration of them in tissues and body fluids, and until the nutritional significance of slightly abnormal values are known, it will be impossible to state, in the case of a single individual, the clinical significance of such a slight deficiency.

METHODS OF PRODUCTION OF DEFICIENCY DISEASES: TYPES OF PATIENTS

It is commonly believed that vitamin-deficiency diseases occur only when the diet is inadequate. While this is probably the most common cause of deficiency disease, there may be other factors of etiologic importance, such as an increased demand for vitamins during pregnancy, during fever and when the basal metabolism is increased, such as loss of or destruction of vitamins after ingestion, and such as abnormalities in gastro-intestinal function. (Table 2.) During pregnancy and lactation, for example, the need for certain vitamins may be increased from 10 to 100 per cent, or even more above the requirement for the normal person.

Vitamin-deficiency states should be looked for particularly among those patients who have been on an inadequate diet in an attempt to reduce weight, or due to alcoholism, economic difficulties, faddism, or to poor therapeutic dietary advice, such as long-continued elimination diets, diets for gastro-intestinal diseases, allergic conditions, and so forth. (Table 3.)

THE DIAGNOSIS OF DEFICIENCY STATES

In considering the diagnosis of deficiency disease it is important to keep in mind the fact that the clinical features of a deficiency disease may vary within wide limits. This is due to the fact that there is great individual variation in the response of patients and also experimental animals to the same deficiency diet, and that it is questionable if a vitamin-deficiency state ever exists in pure form. There is almost always deficiency of more than one of the vitamins in a single patient. In fact McCollum and Simmonds pointed out some time ago that it is questionable if a pure vitamin-deficiency state, with the possible exception of scurvy, ever has been produced in the experimental animal.

The diagnosis of vitamin-deficiency states depends principally on clinical observations, although there is rapidly accumulating laboratory evidence to suggest that certain chemical or biologic tests may be useful in substantiating the diagnosis, or in establishing it in the absence of clear-cut clinical findings. A therapeutic test also may be of considerable value as diagnostic procedure, for now that some of the vitamins may be obtained in crystalline form, the specific response to use of a pure form of a vitamin may be considered significant in establishing a diagnosis in some cases.

VITAMIN A DEFICIENCY

Symptoms.

The most readily appreciated clinical symptoms of vitamin A deficiency have to do with changes occurring in the eyes. These symptoms consist principally of night blindness or inability to see clearly in dusky light, and of irritation of or lesions of the conjunctivæ. In its most exaggerated form, xerophthalmia (which is rarely observed in this country), there may be dryness of the conjunctival tissues, conjunctivitis, softening of the cornea, infection of the eyeball, and blindness.

Night blindness, which occasionally may be due to intra-ocular disease such as retinitis pigmentosa, is usually manifested by difficulty or inability of the patient to adapt his vision to faint illumination, although during the daytime or in bright light he may see perfectly. In questioning a patient in re-

TABLE 2.—*Vitamin, Protein and Mineral Deficiency States May Be Produced as a Result of:*

1. Inadequate intake of essential substances in the diet.
2. Increased requirements during periods of rapid growth, pregnancy, infections, fever, elevated basal metabolic rate.
3. Impaired or altered gastrointestinal function.
4. Altered metabolism of the vitamin.

gard to night blindness, particular attention should be paid to vision while driving a car at night, while in a theater or the movies, while walking at night or in the dark, or on entering a house from the bright sunlight. Such patients are apt to bump into things while walking at night, to have difficulty in driving a car at night because they cannot see the road or are dazzled by the lights of an approaching car, or to have difficulty in distinguishing facial features, the hands of a clock, or details of a picture, on entering a dimly lighted room.

A history of conjunctival irritation or dryness, which cannot be explained otherwise, may be obtained in some patients with vitamin A deficiency. Examination of the conjunctivae may reveal pigmentation, or there may be dryness or a granular appearance to the conjunctiva if the lids are held away from the eyeball for a few moments.

There has been discussion of the relation of vitamin A deficiency to cutaneous lesions, to lesions of the genital or urinary tract, and to states of lowered resistance to infections. Since deficiency of vitamin A characteristically leads to thickening or keratinization of epithelial tissues, followed frequently by secondary infection, it might be anticipated that cutaneous lesions would occur in vitamin A deficiency. The characteristic change, which is considered by some authorities to be the first manifestation of deficiency, consists of keratinization of a hard, dry papular type that resembles goose flesh and is most marked on the exterior surfaces of the forearms, legs, and thighs. A somewhat similar keratinization of the mucous membrane of the vagina, leading to a lesion resembling that of atrophic or senile vaginitis, has been reported in vitamin A deficiency. The relation of vitamin A deficiency to renal lithiasis in man is still indefinite, and while there is evidence to substantiate the view that in some cases renal lithiasis may be related to deficiency of vitamin A, in most instances of stone this does not seem to be the case.

The only recognized anti-infective influence vitamin A possesses is in maintaining normal epithelium, which will act as a barrier to infection; and since, so far as is known, the vitamin does not have any influence on immunological processes, it seems obvious that vitamin A in reality is not an anti-infective vitamin.

Diagnosis.

Principal interest at present in the diagnosis of vitamin A deficiency is in the detection of states of mild or partial deficiency in which the clinical diagnosis is not easy (Table 4). When the physician is confronted by a patient whom he suspects may have vitamin A deficiency, he should inquire into the presence of night blindness; and on examining the patient he should look for dryness or pigmentation of the conjunctivae and for a papular cutaneous eruption involving particularly the limbs, especially the exterior surfaces.

If vitamin A deficiency is suspected, there are three methods of diagnosis which may be employed in an attempt to confirm the clinical history suggesting that a deficiency exists or to suggest its presence in the absence of clinical findings. There are (1) a study of the sensitivity to light following partial adaptation to darkness, as determined by biophotometric methods of Jeans and Zentmire; (2) scrapping of the conjunctival, nasal or vaginal mucous membrane, making smears and examining them for keratinized epithelial cells; and (3) administration of vitamin A in crystalline or concentrate form. These methods are all relatively indirect, but if either of the first two tests proves to be positive, and if there is disappearance of these signs or of previously noted night blindness or cutaneous or conjunctival symptoms following administration of vitamin A or carotene, the diagnosis of vitamin A deficiency seems reasonably well established.

Physical and chemical methods for determining the vitamin A content of body fluids and tissues have been developed, but have not as yet proved satisfactory for clinical detection of vitamin A deficiency.

The diagnosis of very mild or "preclinical" deficiency of vitamin A in which clinical signs are absent is made at present only by use of the biophotometer. Patients who have no clinical evidence of vitamin A deficiency, but who have defective adaptation to darkness as revealed by this test, and who have normal adaptation after administration of vitamin A, are considered by some observers to have mild deficiency of vitamin A. The frequency with which "clinic populations" have a positive test with this method is in the neighborhood of from 50 to 75 per cent of all those tested, but the clinical significance of this observation has not been established.

Treatment.

Deficiency of vitamin A usually may be prevented by the use of adequate amounts of the following foods rich in vitamin A or carotene: butter, cream, eggs, cod-liver oil, carrots, and spinach. Fish-liver oils which are particularly rich in vitamin A are those of the halibut, cod, burbot, and tuna.

The daily optimal requirement of vitamin A is not known, but it is probably in the neighborhood of 6,000 to 10,000 U. S. P. units. In the treatment of vitamin A deficiency states, the following measures are of value: (1) a diet containing many foods rich in vitamin A; (2) supplements to the diet of

TABLE 5.—*Thiamin Deficiency (Vitamin B_1)*

vitamin A in cod or halibut-liver oil in amounts of 10,000 to 25,000 U. S. P. units daily (Jeghers suggests 70,000 U. S. P. units orally for two weeks, and the 25,000 units until the patient is normal); (3) in rare instances by intramuscular injection of cod-liver oil or other substances rich in vitamin A.

VITAMIN B_1 (THIAMIN) DEFICIENCY

Symptoms.

Thiamin is a catylist essential for the oxidation of carbohydrates, and when it is not present in adequate amounts in man the characteristic symptims of peripheral neuritis, circulatory failure, and beriberi occur. (Table 5.)

As Strauss and others have indicated, the diagnosis of alcoholic, diabetic, biliary, gastrogenic and postinfective polyneuritis, polyneuritis of pregnancy, and of Korsakoff's syndrome, have all concealed the true diagnosis of thiamin (vitamin B_1) deficiency. While symptoms of these conditions may be sudden in onset they are generally insidious, and the earliest manifestations usually are heaviness in the legs and tenderness of the calf muscles when they are squeezed. Weakness of the limbs, burning of the soles, and numbness of the dorsum and lower part of the ankles, are next to appear, followed by hypesthesia, which advances up the leg and thigh, and by atrophy of the muscles and of the skin. With these symptomatic changes there usually are associated diminished or absent reflexes in the involved extremities and various degrees of muscle weakness.

The cardiovascular manifestations of thiamin deficiency have been extensively studied by Weiss and Wilkins, and consist principally of dyspnea and palpitation on exertion, tachycardia, and edema. In cases in which the deficiency is greater the clinical picture may be that of cardiac failure with an enlarged area of cardiac dullness or an enlarged shadow on the roentgenogram, signs of right or left heart failure, and extensive edema or anasarca with or without signs of peripheral neuritis. It is obvious that in the absence of marked changes these manifestations do not, for the present at least, comprise a rigid and easily recognized clinical syndrome.

Other manifestations of thiamin deficiency which have been reported over a period of years include gastro-intestinal changes such as anorexia, glossitis, achlorhydria and diarrhea, and changes in the blood such as those indicating anemia. As Strauss has pointed out, there is considerable evidence to suggest that these phenomena are, at least in part if not entirely, manifestations of a deficiency of some portion of the vitamin B complex other than thiamin.

Diagnosis.

The diagnosis of well-established thiamin deficiency is simple if the characteristic triad of symptoms of beriberi, namely, edema, peripheral neuritis and cardiac failure, is present.

The diagnosis of a moderate degree of thiamin deficiency is usually not difficult, and with increasing recognition of the fact that peripheral neuritis is usually due to thiamin deficiency, the diagnosis is being made much more commonly than it was a few years ago. Recognition of cardiovascular symptoms as being due to thiamin deficiency has been a much more recent development and, because of this fact and the nonspecific character of the symptoms and findings, namely, dyspnea and palpitation on exertion, edema, and circulatory failure, the diagnosis is more difficult to establish.

Thiamin deficiency is usually to be found in chronic alcoholics, among patients who have been on a limited diet as a result of economic disability, faddism, ignorance or in an attempt to reduce weight, and during pregnancy and lactation.

There are no laboratory procedures which are helpful in determining the adequacy of the thiamin metabolism of a patient. Recently, several biologic tests revealing the apparent thiamin content of tissue fluids or of urine have been developed, but they are not of sufficient simplicity and perhaps accuracy to permit their use in the ordinary clinical laboratory. However, there are two other methods which will enable the physician to suspect that symptoms of his patient are due to thiamin deficiency. These are the calculations of Cowgill's formula and the therapeutic test. In cases in which the previous diet is known, an estimation of the adequacy of the thiamin content of the diet, as compared with the requirement of the patient, may be made by Cowgill's formula. Cowgill has shown that the requirement for thiamin is proportional to both intake of calories and body weight.

The therapeutic test with thiamin may be very useful in establishing a diagnosis of previous deficiency, but great care must be exercised in regard to the interpretation of the clearing up of cardiovascular symptoms, because frequently associated methods of treatment such as rest in bed, sedatives, digitalis, and psychic influences, may be the significant curative factors.

Evidence for thiamin deficiency of very mild character has not been established because of lack of chemical or other direct methods of determining the status of thiamin metabolism in patients with clinically recognizable deficiency.

Not infrequently, in association with thiamin deficiency, will be found evidence of deficiency of other components of the vitamin B complex,

Table 6.—*Vitamin B Deficiency (Other than in Thiamin)*

Clinical Changes	Deficiency of	Tests
Pellagra	Nicotinic acid Thiamin Other factors?	Therapeutic only
Macrocytic anemia	Uncertain	Therapeutic only
Gastro-intestinal: glossitis, anorexia, achlorhydria, hypotonicity, hypomotility	Uncertain	Therapeutic only

such as gastro-intestinal symptoms or macrocytic anemia. These symptoms and findings may prove helpful in establishing the correct diagnosis.

Treatment.

In the treatment of thiamin deficiency the exhibition of all of the following measures will be found most helpful: an adequate diet high in vitamin B content, preparations of brewers' yeast or wheat germ and crystalline thiamin chlorid. While crystalline preparations are available they should not, for two reasons, be used exclusively in the treatment of thiamin deficiency: first, because, as has been pointed out, most patients with thiamin deficiency have evidence of deficiency of other components of the B complex, and secondly, because crystalline thiamin chlorid is still quite expensive.

For those patients with only moderate deficiency, and without evidence of impairment of gastro-intestinal function, the use of 30 grams of powdered brewers' yeast of good potency, or 6 grams of autolyzed yeast, administered three times daily, is generally adequate. Along with this should be a high caloric, high vitamin diet, if it can be tolerated, and from 10 to 40 milligrams of thiamin chlorid daily, intramuscularly or orally administered. For those patients with severe cardiac symptoms, daily intramuscular or intravenous injections of similar doses of thiamin may be advisable. In addition, dilute liver extracts, suitable for intramuscular injection, given in doses of 10 to 20 cubic centimeters or more daily, are helpful in controlling glossitis and cutaneous manifestations of the type associated with pellagra. As soon as the patient shows evidence of distinct improvement, the dose of crystalline thiamin may perhaps be reduced to 10 to 15 milligrams daily; but it is advisable to maintain large doses of thiamin and other portions of the vitamin B complex, in the form of food and of yeast and wheat germ.

DEFICIENCY OF VITAMIN B (OTHER THAN THIAMIN)

The vitamin B complex consists of a variety of factors other than thiamin, such as riboflavin, the P-P factor (nicotinic acid?), a filtrate factor, vitamin B_6, and others. However, so far only two members of the complex, namely, thiamin and the P-P factor, have been linked unquestionably with deficiency disease in man. (Table 6.)

THE ROENTGEN DIAGNOSIS OF DISEASES OF THE ILEOCECAL REGION OF THE GASTRO-INTESTINAL TRACT*

By Joseph Jellen, M.D.
Los Angeles

PART I

INTRODUCTION

There are a large number of disease entities which characteristically affect, and show a special predilection for, the ileocecal region of the gastro-intestinal tract. The purpose of this communication is to present a topographical classification of these conditions, in an attempt to facilitate the roentgen diagnosis. The conditions which are noted in the ileocecal segment of the intestine present a varied symptomatology, and differentiation on a clinical basis alone is difficult. In many instances, the diagnosis rests ultimately on the roentgen examination. The differentiation is particularly difficult in those instances where there is a history of pain in the right lower quadrant of the abdomen, associated with a palpable mass. Many of these conditions present a very similar roentgen appearance, and it is only by a consideration of all the possibilities, that we may hope to arrive at the proper diagnosis. In this regard, a topographical classification would seem to be of value.

A CLASSIFICATION OF DISEASES AFFECTING THE ILEOCECAL REGION FROM THE ROENTGENOLOGICAL STANDPOINT

I. Congenital Anomalies.
    (a) Transposition of the colon.
    (b) Anomalies of descent of the cecum.
    (c) Inverted cecum.
II. Ileocecal Bands.
    (a) Congenital.
    (b) Adhesions (postoperative).
III. Benign Tumors.
    (a) Fibroma.
    (b) Adenoma.
    (c) Papilloma.
    (d) Lipoma.
    (e) Angioma.
    (f) Myoma.
    (g) Carcinoid (argentaffine tumors).
    (h) Endometrial implants.
    (i) Mucous cysts.
IV. Malignant Tumors.
    (a) Carcinoma.
    (b) Sarcoma.
V. Specific Granulomas.
    (a) Ileocecal tuberculosis (primary and secondary).
        1. Ulcerative.
        2. Hyperplastic.
    (b) Actinomycosis.
    (c) Amebiasis.
        1. Amebic colitis (localized or diffuse).
        2. Amebic granuloma.

---

* From the Department of Radiology of the Queen of Angels Hospital, Los Angeles.

Read before the Radiology Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

VI. Nonspecific Granulomas.
  (a) Nonspecific ulcerative granulomas (acute, subacute, and chronic).
    1. Regional ileitis.
  (b) Inflammatory granulomas secondary to
    1. Appendicitis.
    2. Typhlitis.
    3. Cecal diverticulitis.
  (c) Peri-intestinal granulomas (secondary to perforations of the bowel, *i. e.*, by fishbone or toothpick).

VII. Lymphoblastoma.
  (a) Hodgkin's disease.
  (b) Lymphosarcoma.
  (c) Follicular lymphoblastoma.

VIII. Appendiceal Infections.
  (a) Appendicitis.
  (b) Fecaliths of the appendix (calcified).
  (c) Appendiceal abscess.
  (d) Mucocele of the appendix.

IX. Intussusception.
  (a) Ileocecal.
  (b) Cecocolic.

X. Diverticulosis.
  (a) Diverticulitis of the cecum.

XI. Mesenteric Adenitis.
  (a) Nonspecific.
  (b) Associated with appendicitis, ileitis, etc.
  (c) Tuberculous.
  (d) Calcified.

XII. Localized Ulcerative Colitis (Proximal Colon Involved).
  (a) Specific.
    1. Amebic.
    2. Tuberculous.
  (b) Nonspecific.
    1. Localized hyperplastic colitis.
    2. Ulcerative colitis associated with regional ileitis.

CONGENITAL ANOMALIES OF THE COLON

Congenital anomalies of the proximal colon are occasionally noted in the gastro-intestinal examination. Nonrotation of the colon is found at times. More often, variations in the degree of descent and fixation of the cecum are observed. The changes noted often correspond to the habitus of the individual, and the large normal variation should be kept in mind before any symptoms are attributed thereto.

ILEOCECAL ADHESIONS

Adhesions in the ileocecal region may be either congenital or acquired. In the former category may be mentioned Lane's kink. In this condition there is angulation and constriction of the terminal ileum, due to the peritoneal reflection from the cecum. Formerly, there was great stress placed on the relation of the condition to chronic intestinal stasis. In the great majority of cases, adhesions are acquired and postoperative in nature. Perforated appendicitis with local peritonitis is a common cause for adhesions in the right lower quadrant of the abdomen. Adhesions secondary to adnexal disease in the female is also encountered. The condition is manifest, clinically, by abdominal pain, distention, and vomiting. In other cases there is evidence of varying degrees of intestinal obstruction.

The roentgen examination is of great value in the diagnosis. Loops of small intestine are matted together, and there is fixation noted during the roentgenoscopic examination. At times there is constriction of the terminal ileum with dilatation of the intestinal loops proximal to the involved area. There is usually a delay in small intestinal motility, and a barium residue may be noted in the ileum as late as twenty-four hours after the ingestion of the barium meal. A residue in the small intestine from nine to twelve hours after the ingestion of the barium meal is suggestive of delay in small intestine motility. The normal variation in motility must be considered before attaching significance to the roentgen findings.

BENIGN TUMORS

Various types of benign neoplasms are found in the ileocecal region. Raiford[1] reported a series of forty-eight neoplasms of the small intestine situated in the ileum. The following types of benign tumors, in order of frequency, were found: adenoma, argentaffine tumors, lipoma, fibroma, myoma, hemangioma, and accessory pancreatic tissue. These benign tumors are usually silent until they are fairly large in size, at which time they become manifest by intestinal obstruction. Benign intestinal polyps are occasionally found in the proximal portion of the colon, although they are found more often in the distal colon and rectum. These tumors, though benign in origin, are regarded as precancerous and potentially malignant. According to various statistics, the incidence of cancer in intestinal polyps ranges between 25 and 50 per cent. Roentgenologically, these benign tumors appear as well defined, circumscribed, filling defects in the barium shadow. The double contrast enema is of great value in the demonstration of these neoplasms.

MALIGNANT TUMORS

Carcinoma of the cecum is seen quite often, whereas malignancy of the adjacent ileum is rather uncommon. According to statistics, carcinoma of the cecum comprises about 15 per cent, and carcinoma of the ileum about 3 per cent of intestinal cancers. Occasionally, carcinoma of the cecum involves the adjacent ileum by direct extension. Carcinoma of the cecum is most often of the polypoid type, and the mass is usually palpable on physical examination. The tendency of these tumors to produce marked secondary anemia is well recognized. From the roentgenologic standpoint, these malignant tumors offer very little difficulty in diagnosis. The presence of an irregular filling defect in the cecum is quite characteristic. Malignancy of the ileum is usually manifest by intestinal obstruction.

ILEOCECAL TUBERCULOSIS

Intestinal tuberculosis may affect any portion of the gastro-intestinal tract. The disease, however, is most frequently present in the ileocecal region. Ulcerative ileocecal tuberculosis, secondary to active pulmonary lesions is well known. Hyperplastic intestinal tuberculosis is much less common than ulcerative type, and may, or may not be secondary to tuberculous lesions elsewhere in the body. The hyperplastic type is characterized by an annular thickening of the wall of the bowel, with resultant stenosis of the intestinal lumen. The most common symptoms are abdominal cramps and diarrhea. At times the clinical picture is that of an acute or subacute intestinal obstruction. On physical examination, a mass is very often palpable in the right lower quadrant of the abdomen. The roentgen findings in intestinal tuberculosis are characteristic, but not pathognomonic of the disease. In the ulcerative type, Stierlin's sign is noted. There is irritability, spasm, and localized hypermotility in the involved segment of intestine, and very little barium is retained in this portion of the intestines. In hyperplastic tuberculosis there is constriction and stenosis of the lumen, with obliteration of the normal mucosal markings. Occasionally, filling defects are noted, the appearance of which may simulate carcinoma.

ACTINOMYCOSIS

Actinomycosis of the intestine is often noted in the cecum, and it is present in this location in approximately 25 per cent of all cases. Pathologically, the cecum shows the same thickening as in the hyperplastic form of tuberculosis. Later, suppuration occurs, and the mass is replaced by a number of small abscesses in this region. The disease often spreads to, and perforates, the external abdominal wall, with the formation of chronic draining sinuses. The pus from the discharges contains the characteristic "sulphur granules," in which the ray fungus is demonstrated. Secondary involvement of other abdominal organs, particularly the liver, also occurs. Clinically, these cases must be differentiated from regional ileitis, as this disease is also characterized by persistent abdominal fistulae. In actinomycosis the roentgen examination reveals contraction of the cecum, and filling defects when the process is more advanced. Differentiation from hyperplastic tuberculosis and carcinoma of the cecum is difficult, and the ultimate diagnosis often rests on the demonstration of the ray fungus in the discharges.

AMEBIASIS

Amebic infection of the intestine occurs in two types. In the first, there is an ulcerative colitis of specific etiology which commonly involves the proximal colon. At times, the process spreads and involves the entire colon. Occasionally, there is retrograde involvement of the terminal ileum. The cecum is involved in approximately 85 per cent of the cases. The second type is characterized by the formation of localized granulomatous masses, which are found most often in the cecum and in the flexures of the colon. Gunn and Howard[2] report three cases of amebic granuloma of the colon, two of which involved the cecum. In this type there is marked thickening of the wall of the intestine, as a result of the large amount of granulation tissue present. Clinically, there is usually a palpable mass in the abdomen. The disappearance of these granulomatous lesions has been observed, after the administration of specific therapy for amebiasis. The symptoms of the ulcerative type are identical with nonspecific ulcerative colitis. Examination of the stools reveals the presence of the vegetative forms or cysts of E. histolytica. In the hyperplastic type, diarrhea is often absent, so that carcinoma is usually suspected. The roentgen appearance of amebic colitis is similar to the nonspecific type. The former should be suspected when the process is limited to the proximal colon. In some cases the roentgen examination of the colon with the barium enema is negative, particularly in the early stage. In other instances, irritability and spasm of the intestines are the only positive roentgen findings. In the hyperplastic type there are filling defects in the barium shadow, the roentgen appearance of which may simulate carcinoma.

SELECTIVE ANESTHETIC PROGRAM: ITS DESIRABILITY*

By Hall G. Holder, M.D.
San Diego

Discussion *by W. Le Roy Garth, M.D., San Diego; Edwin H. Kelley, M.D., San Diego; Charles F. McCuskey, M.D., Glendale.*

The proper conduct of the anesthetic is a prime factor in the uncomplicated and successful outcome of surgical treatment together with a carefully planned and executed operation. We are indebted to the pharmacologist and anesthetist for the introduction of many new and efficient agents and improved methods of administration. These have broadened the field of anesthesia, so that a fundamental knowledge of the scope of each is necessary on the part of the surgeon if he is to provide the best agent for his patient. This selection must not only take into consideration the type of surgical treatment contemplated, but also physical, psychic and emotional handicaps. The surgeon has available the consulting or referring physician in evaluating complicating organic disease and emotional reactions of the patient toward the prospective operation. However, just as the physician who recommends a surgeon to the patient takes a definite responsibility in the eyes of the patient and his family, so the surgeon and not the anesthetist is held directly responsible for all details of the surgical procedure. Most patients are informed, in a general way, of the progress of anesthesia and for the most part the type of anesthesia must be discussed and at least tentatively decided upon, together with facts concerning the operation, hospital accommodations, fees and other details of vital interest to him. The relation of patient and surgeon is direct and personal as a result of careful study and discussion of the problems of treatment involved. It is only fair to the anesthetist that the usual impersonal attitude toward his services be corrected and the function of the anesthetist as a consultant be explained, and any suggestions for the betterment or safety of the anesthetic program be communicated to the patient. This, I believe, can best be done on admission of the patient to the hospital by a formal visit and consultation with the anesthetist, at which time he should correlate his findings with those listed from physician, surgeon, and laboratory. If he does not agree with the anesthetic program outlined by the surgeon, mutual agreement on the best procedure may be arrived at and preparation commenced without further delay or upset to the patient.

---

* Read before the Anesthesiology Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

Having long been convinced of the desirability of varying the anesthesia to suit the individual circumstances, I reviewed the types of anesthesia employed in one thousand consecutive major operations in my private practice. This revealed that 9 per cent were given open ether, 25 per cent gas, oxygen, ether series, 11 per cent avertin basal (supplemented usually with nitrous oxid or ethylene and occasionally combined with ether or, in a few instances, with open ether), 9 per cent nitrous oxid alone, 12 per cent with ethylene alone, or a total of 21 per cent with these gases alone; 32 per cent spinal and 2 per cent local, including any other type of regional anesthesia.

With the present latitude of anesthetic procedure and its attendant advantage to patient and surgeon, empiric insistence on one anesthetic procedure by either anesthetist or surgeon is unprogressive. Observation would indicate that anesthetists favor inhalation anesthesia, while surgeons incline toward regional anesthesia where there is no contra-indication to its use. However, there should be no divergence of opinion because both have their distinct place.

INHALATION ANESTHESIA

Preoperative medication is routinely used, and I believe that split doses of barbiturates the night before and the morning of operation, with the usual dosage of morphin, or one of the newer derivatives with atropin or scopolamin, is standard procedure.

The proper technical administration of inhalation anesthesia has no interest for the surgeon. It is important for him to be conversant with the four planes of anesthesia, as in the average operation requiring one hour, perhaps only five or ten minutes need be third-plane anesthesia; so that by mutual understanding between anesthetist and surgeon unnecessary and prolonged deep anesthesia may be avoided, with distinct benefit to the patient. Anesthetists, by their use of the intratracheal catheter, have produced quieter and smoother anesthesia for upper abdominal surgical procedures. Likewise, by the use of a basal anesthetic such as avertin difficult upper abdominal procedures requiring adequate anesthesia to perform a careful nontraumatizing operation is very helpful. More recently evipal soluble has been used and has the advantage over avertin of simplicity of preparation and administration with less toxicity. Both, in producing a satisfactory basal state, reduce the amount of supplementary anesthetic by one-third or even one-half. My patients uniformly praise avertin basal anesthesia; and if they have had previous anesthetics are unanimous in their opinion that the onset of anesthesia while lying in bed prior to leaving their room is far superior to any other type of induction. Obviously, this is the method of choice in apprehensive and nervous individuals and the one which I use in this type of patient if possible. Also, the continued period of analgesia following operation allows these patients, in most instances, to completely recover from any initial pain or shock as a result of the operative procedure before they regain full consciousness.

Even with adequate preparation not infrequently a patient tolerates an inhalation anesthetic poorly. The mistake is made by the anesthetist in delaying the change to a better-tolerated one, it being a matter of pride with some anesthetist that they can anesthetize any patient under any circumstance with one agent or method. It is obvious that it is unwise to push any type of anesthesia beyond its limitations. This particularly applies to the use of gases alone in attempting adequate anesthesia for intra-abdominal procedures. When this is attempted without associated basal anesthesia, the end-result is insufficient relaxation to permit adequate exposure without undue trauma, a poor anesthesia, and a poorly done operation. The worst feature of the anesthesia is the necessity on the part of the anesthetist to increase the concentration of gas in a vain effort to obtain adequate relaxation to the point of resultant cyanosis. There seems to be good evidence that the narcotic action of nitrous oxid is enhanced by some degree of anoxemia. Inasmuch as it must be given in high concentration, the administration is frequently accompanied by cyanosis. It is appreciated that there is a difference of opinion among good anesthetists whether any clinical cyanosis in gas anesthesia is harmful; but as far as my own patients are concerned, I prefer to adhere rigidly with those claiming any degree of clinical cyanosis bad practice and unnecessary to proper administration. My conviction in respect to this point of view has not been lessened by the several reports of severe degeneration of the brain with subsequent death following nitrous oxid and cyclopropane anesthesia. Two recent reports by Gebauer and Coleman,[1] and O'Brien and Steegman,[2] detail cases of cerebral necrosis with death in the first instance with cyclopropane, and the second, nitrous oxid, in which there was no clinical cyanosis. Courville,[3] in discussing the pathogenesis of cerebral necrosis in this connection, points out that the weight of opinion supports asphyxia as the cause rather than any toxic or narcotic action of the gas. Further emphasis of this point is had by a clinical death from this syndrome in my own practice. The patient, an elderly woman, took a very poor nitrous oxid anesthesia, as evidenced by periods of cyanosis subsequent to periods of temporary arrest of respiration. Postoperative clinical evidence of cerebral damage, which, unfortunately, we could not confirm by autopsy, was failure to regain consciousness, muscular twitchings, convulsive seizures, profound restlessness and hyperthermia, death resulting in five days.

The value of these agents has been demonstrated beyond doubt, but the importance of careful administration and a knowledge of their limitation is equally vital to all concerned. The value of versatility and adjustments of agents, or combination of agents or methods, to physical or psychic tolerance on the part of the patient is equally important. The value of basal anesthesia and improved methods of technique, such as the intratracheal catheter for upper abdominal, and head and neck surgery, especially in the presence of fire hazards, needs no further comment.

My experience with intravenous agents has been limited to short procedures. It is entirely safe with careful administration, and is of definite advantage because of the prompt return to consciousness without nausea and vomiting. Patients should not be dismissed until entirely recovered or properly attended. Its simplicity makes it very useful for office cases, and its freedom from fire hazard is helpful in cases requiring high-frequency cutting or the cautery.

SPINAL ANESTHESIA

As noted, spinal anesthesia was employed in 32 per cent of cases. It is an established fact that it provides the most ideal conditions for the technical performance of surgical procedures. Further, it is acknowledged to be the anesthetic of choice in a number of surgical conditions, provided there are no contraindications to its use.

Fourteen years' observation of many hundreds of spinal anesthesias provides a knowledge of only two deaths from this agent, one directly due to the anesthetic and the other to coronary thrombosis confirmed at autopsy, possibly precipitated by the anesthetic. No other residual sequelae or complications have come to my attention. It is, therefore, disturbing from time to time to read reports[4] of clinical changes in the nervous system, and of associated sequelae and complications following spinal anesthesia. If these have occurred in my practice, they have gone unrecognized by the patient and myself. The only conclusion I can reach—if such reports are authentic, which they undoubtedly are—is that gross error in technique must be responsible for their occurrence. Likewise, Davis et al.[5] reported persistent changes in the structures of the spinal cord of dogs, to which had been administered varying doses of spinal anesthetic agents through a ninety-day period. These changes were given as inflammatory reaction in the leptomeninges, passive changes in the ganglion cells, swelling and fragmentation of the axis cylinders, and degenerative changes in the fiber tracts of the cord.

Although there were no clinical manifestations of such changes in my patients, I felt such findings were a serious indictment of spinal anesthesia and undertook to confirm these histologic studies, using a total of twenty-two dogs. I was not interested in the reaction of the structures in the cord to massive doses of the various agents, but rather the reaction to a comparable dose given man. We were unable to do accurate and atraumatic spinal puncture in the dog, as Davis and his associates so resorted to laminectomy in each instance. Two animals developed wound infections and were discarded and two were used as controls. Six dogs, varying in weight from 8 to 24 kilograms, were given, in the lumbar region, from 15 to 45 milligrams of dissolved novocain crystals, using spinal fluid, and destroyed from four to thirty days, the cords carefully removed and fixed in Muller's solution. A second series of six dogs, varying in weight from 14 to 24 kilograms, were administered by the same technique amounts of nupercain, varying from 0.4 to 0.7 cubic centimeter, and destroyed at similar intervals. The third group of six dogs, varying in weight from 8 to 45 kilograms, received, by a similar method, doses of from 0.3 to 0.6 cubic centimeter of a mixture of 50 milligrams of novocain and 2 cubic centimeters of nupercain, the cords being removed at intervals, as in the other series. This latter combination was studied because of my interest and report[6] of its advantage in obtaining faster onset of anesthesia when nupercain was employed. The segments of the cord were treated with Marchi stain for detection of myelin sheath degeneration, and hematoxylin-eosin for general configuration and meningeal examination; Nissl stain for nerve cells and cytoplasmic granules; Bielschowsky silver stain for collogen fibrils, axis cylinder and dendritis; Weirgert-Pal stain for medullary sheath; and Weirgert stain for fibrin and glia fibers. These sections, taken at different levels throughout the cord, were examined by Dr. Earl Meyers, who was associated with me in this work. Any controversial sections were submitted to others for opinion, and it was their combined report that no pathological changes were present in the structures of the cord as a result of these therapeutic doses. It is to be remembered that nupercain is reported to be many times more toxic than novocain, although in the therapeutic doses used, no toxic effects could be demonstrated.

Koster,[7] using frogs because of the simplicity of injecting the urostyle without trauma, administered sublethal doses of novocain to 528 frogs. These animals were then destroyed from one hour after administration at regular intervals up to one hundred days, and similar histologic studies made of the spinal cord. He noted transitory changes in the structures of the cord, which began to regress in six hours and entirely disappeared in twenty-four hours. In the same report Koster relates the similar examinations of six human spinal cords of patients dying of other causes, following the administration of spinal anesthesia. The time interval following anesthesia in these cases was 22, 36, 96, 144, 192, and 816 hours. In no instance was there any demonstrable histologic change from the normal. Similar confirmation of Koster's findings is to be had in the works of van Lier,[8] Wassildo,[9] Babcock,[10] Pitkin,[11] and Lundy, Essex and Kernohan.[12]

From clinical observation and histological examination of animal and human spinal cords, we can conclude without reservation that spinal anesthesia is devoid of injury or sequelae if properly administered.

In preparation for spinal anesthesia I use the same combination of drugs as for inhalation anesthesia, with the addition before administration of ephedrin to minimize blood-pressure fall. If it is then advisable to supplement with one of the gases, because the patient objects to the conscious state or the spinal anesthesia is not adequate, this can be done immediately. If it is important or desirable from a surgical standpoint to use spinal anesthesia, one need not fear the combination of inhalation agents for the comfort of the patient at any time during the course of the operative procedure. The idea that, because patients have had a satisfactory spinal anesthesia, they must endure fatigue, aprehension and psychic trauma through their experience and surroundings is unfeeling. I therefore purposely supplement a large percentage of my spinal anesthesias with narcotic doses of the gases, knowing the patient is comfortable at the same time having the superior effect of the spinal for the surgical problem at hand. In this enlightened age of anesthesia our patients expect, and have a right to demand, comfort and freedom from pain regardless of the surgical condition. In this connection, to those patients to whom I recommend spinal anesthesia, I emphasize the fact that administration is absolutely painless. Therefore, the anesthetist must be thoroughly conversant with principles of spinal anesthesia and perform a painless, accurate and speedy spinal puncture.

The only postoperative morbidity that has been noted following spinal anesthesia is an occasional headache. These, with improved technique, have been reduced to a minimum of late years. As a matter of fact, the incidence of headache is as great, or greater, after inhalation anesthesia, particularly the gases, than following spinal anesthesia. Furthermore, the spinal headache may be relieved immediately by the simple intravenous injection of caffein sodium benzoate.

SUMMARY

1. The limitations of gas anesthesia are discussed and the hazards of cyanosis and anoxema stressed.
2. The psychic and practical advantage of rectal basal anesthesia is given.
3. The case for spinal anesthesia is presented and proof of its safety and freedom from sequelae with proper administration detailed.
4. The desirability of a careful individualization of patients in respect to anesthetic agents employed, considering psychic as well as physical status, is the principal theme. The closest coöperation of surgeon and anesthetist to provide maximum comfort to the patient consistent with the best end-result of surgical therapy should be the goal of both.

DISCUSSION

W. Le Roy Garth, M.D. (233 A Street, San Diego).—Doctor Holder is to be complimented for having thought enough about this problem to write a paper on the subject. Many surgeons let habit get the best of them and allow themselves to fall into a rut regarding the proper selection of anesthesia for the individual patient. Anesthetists, themselves, easily develop bad habits in this respect, and should be properly grateful to a surgeon who refuses to let them do so in respect to his patients. However, they must disagree with Doctor Holden when he says that "the surgeon and not the anesthetist is held directly responsible for all details of the surgical procedure." This fallacy dates back, we believe, to the days of technician-administered anesthesia, when the surgeon really did have to superintend the administration of the anesthetic, and when he really did have to take the blame when things went wrong. We contend that the modern physician anesthetist should certainly be expected to relieve the surgeon of most of this burden and, if it comes to a showdown and there is a death on the table, the anesthetist must perforce be held equally responsible, with the surgeon and with the internist, for what has happened.

Regarding the types of anesthesia used in Doctor Holder's one thousand cases, it should be noted that this series extended over a period of several years, and that the proportions of the different types used at present would vary considerably from this list. The principal changes perhaps would be in the rapidly increasing use of cyclopropane, the practical abandonment of open ether, and in a considerable decrease in the percentage of spinal anesthesia used. In place of avertin, sodium evipal is used rectally as a basal anesthetic with increasing frequency.

Doctor Holder's insistence on the avoidance of cyanosis in connection with gas anesthesia has been, I believe, a definite factor in improving anesthesia practice in this locality. Momentarily, at least, cyanosis may be unavoidable, but the deliberate administration of a mixture of gases low in oxygen content should never be tolerated. Fortunately, there has been little temptation to do this since the advent of cyclopropane.

As indicated by Doctor Holder's experiments, and those of Koster and others, the possibility of lasting injury to the spinal cord in connection with spinal anesthesia is extremely remote. So remote, in fact, as to be in a class with the explosion hazard in connection with the use of ethylene and cyclopropane. The open-minded surgeon and anesthetist properly evaluate the slight risk involved in using these agents and methods, as compared with the tremendous advantages obtained, and insist on using them when indicated.

⁂

Edwin H. Kelley, M. D. (1205 Medico-Dental Building, San Diego).—Doctor Holder speaks of a formal visit and consultation with the patient on his admission to the hospital and an anesthetic program decided upon. This, we believe, is very important because no one is more aware of the merits and limitations of the various types of anesthetics than is the anesthetist. Past experience has taught him the futility of giving nitrous oxid when cyclopropane is clearly indicated. Furthermore, most patients are more apprehensive concerning the anesthetic than the actual surgery.

We routinely use avertin, evipal or paraldehyd rectally in preoperative preparation. When avertin is used, 80 milligrams or less is given forty-five minutes before surgery, preceded by morphin sulphate, grain 1/6, and atropin, grain 1/150, fifteen minutes sooner. With paraldehyd, one cubic centimeter for every eight pounds of body weight in double the amount of olive oil is given two hours before surgery. One hour before surgery, the hypodermic is given and this consists of morphin sulphate, grain 1/6, and scopolamin, grain 1/150. An advantage of the latter is that the patient is sleepy nearly all day and is unaware of the elimination of the anesthetic agent. Nausea is much less common with this type of procedure. The Navy surgeons, in addition to either of the above methods, give prostigmin, ampoule 1/1 by hypodermic two hours before surgery. As a postoperative procedure they give glycerin, 5 cubic centimeters, by mouth every four hours for five days to prevent distention and supplement this with prostigmin, ampoules 1/1, every four hours for five doses in the most stubborn cases.

We use nitrous oxid only for induction, later changing to cyclopropane or ethylene, unless a cautery or radial knife is used, at which time nitrous oxid is used throughout. An added precaution of removing the ether jar and rinsing the rubber bag on the machine with water before the cautery is used is an aid in guarding against explosions.

Of the intravenous agents, pentothal sodium is preferable to evipal. However, when either is used in the office, not more than .5 gram should be used. Upward of this should be a hospital case. If either of these are to be used at the County Hospital, the patient is admitted for at least twenty-four hours and closely observed during the period following surgery. In one case there, a gunshot wound when the entire lower jaw, half the tongue and glottis were shot away, we used pentothal for three hours and ten minutes. Normal saline was started intravenously and the pentothal injected through the rubber tubing as needed. Nearly four grams were used.

Doctor Holder mentions Doctor Davis, who reported persistent changes in the structures of the spinal cord following spinal injection. We presume he means Loyal Davis, head of the Department of Surgery at Northwestern University. As a result of his experiments on dogs, spinal anesthetics in any form are forbidden in Passavant, the University Hospital. This seems absurd. We do feel a spinal should be given by an anesthetist who has the equipment, gas or carbogen, should the spinal prove ineffective or the surgical procedure carry beyond the time allotted a spinal. Ethylene added to a spinal before the skin incision is made is ideal.

⁂

Charles F. McCuskey, M.D. (1561 Puebla Drive, Glendale).—Speaking from the viewpoint of an anesthetist, I should like to congratulate Doctor Holder on the variety of anesthetic procedures which he uses. It is certainly a great improvement over the program of many surgeons who adhere to the use of one anesthetic agent and method regardless of the type of operation or physical condition of the patient.

In our own practice, in addition to the variety of procedures enumerated by Doctor Holder, we have found regional block, alone or combined with gas or avertin, of value. Thyroid operations on the exophthalmic type or extremely toxic adenomas frequently do better with avertin plus local than with local alone. Abdominal field block for intra-abdominal operations on patients that appear too sick for spinal or peridural anesthesia will enable the anesthetist to produce sufficient relaxation without resorting to deep surgical anesthesia. Ethylene can be used for these cases without producing cyanosis or the addition of ether, but my own preference is cyclopropane.

It is well to keep in mind that the chief function of the blood is to carry oxygen to the tissues. In the presence of a low hemoglobin the oxygen carrying power is decreased. During spinal anesthesia the tidal exchange may be reduced from 40 to 60 per cent. Such patients should be watched carefully and given oxygen at the first sign of cyanosis.

Proper selection of the anesthetic agent and method of administration to suit the needs of each individual patient will undoubtedly reduce postoperative morbidity by twenty-four to forty-eight hours.

NUCLEUS PULPOSUS RUPTURE: LEGAL-INDUSTRIAL ASPECTS*

By Edmund D. Leonard, J.D.
San Francisco

INDUSTRY'S liability, under the California Workmen's Compensation laws, where employees suffer ruptures of the nucleus pulposus, is not yet clearly determined. It will be definitely ascertainable in the future in direct ratio to the development and certainty of medical knowledge of the causes, the necessary treatment and the disabling effects of such ruptures. But it is possible now to state what the probable liability of industry will be under certain circumstances and to point out in this manner the legal problems which are now presented and which will arise in the future.

ACCEPTED INTERPRETATIONS

Where an employee receives a traumatic injury which in and of itself causes disability without preexisting disease or degeneration playing any part, the employer is liable for the entire disability resulting and for all medical treatment reasonably required to relieve the disability. But where injury is superimposed on a diseased or degenerative condition the employer is not entirely liable for all disability, but only for the disability attributable to the injury as distinguished from that attributable to disease. An employer is not liable for disability which is not due to industrial injury. He is not liable for disability due to the wear and tear of ordinary life, or to nonindustrial infection, degeneration or disease resulting gradually or immediately merely because such disability occurs while the employee is at work.

However, the law holds that an employer takes a man as he finds him. It does not assume that every employee is a perfect physical specimen. If an individual below par suffers an injury which would not disable a more robust man, and it yet does disable the subnormal individual, the employer is, nevertheless, liable. Thus it is that where industrial injury aggravates a preëxisting disease or a preëxisting diseased condition so as to cause disability, the employer is held liable for such proportion of the disability as is attributable to the aggravation.

AGGRAVATION OF PREËXISTING DISEASE

This liability for disability consequent on aggravation of preëxisting disease must be considered from two standpoints: first, as to temporary disability; and, secondly, as to permanent disability.

During the time the employee is temporarily disabled as the result of the aggravating injury, the employer must pay him compensation for his lost wages. He must also furnish him all necessary medical treatment reasonably required to cure and relieve him of the aggravating effects of the injury. If, then, after all reasonable medical treatment required (because of the injury) has been furnished, the employee has been returned to the same approximate condition as would have existed in absence of the injury, the employer has no further liability.

However, if the injury, superimposed on the preexisting condition, leaves a lasting or permanent disability greater than would have existed in absence of the injury, then the employee is entitled to monetary compensation for that proportion of his permanent disability attributable to the injury. But he is not entitled to disability benefits for that proportion of any permanent disability he may have which is solely attributable to preëxistent disease uninfluenced by injury.

The liability of an employer to furnish medical treatment is in all cases limited to the furnishing of only such medical treatment as is reasonably required to cure and relieve from the effects of industrial injury.

CLASSIFICATION INTO THREE GROUPS

The foregoing principles take into account three possible classes of cases:

---

* Read before the Industrial Medicine and Surgery Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

Paper by invitation.

1. Where disability results solely by reason of traumatic injury.
2. Where disability results by reason of a traumatic injury superimposed on preëxisting disease or degeneration.
3. Where disability results solely by reason of the natural progression of disease or of a degenerative process.

Whether cases involving rupture of the nucleus pulposus can be divided into these three classifications and, if they can, the factors upon which individual cases are to be allocated to one classification rather than to another, is the principal medico-legal problem involved. Secondarily, where it is found that industrial injury is partially or entirely responsible there is the question as to the nature and extent of medical treatment which must be afforded by the employer to cure and relieve from the effects of the injury. Lastly disability, both temporary and permanent, must be evaluated in cases where injury is a causative factor.

REASONS FOR CLASSIFICATION

In presenting to the medical profession the question of whether ruptures of the disc should be classified as industrial, partially industrial, or wholly nonindustrial, the attorney dealing with these cases is induced to ask the question by reason of some or all of the following facts: Within the last two years disabilities due to these ruptures have formed the basis of numerous claims presented to employers and their insurance carriers, with few, if any, such claims having previously been made. Investigation of these claims often fails to develop any definite history of trauma or injury, or a history of only minor strain or trauma. Considerable time may have elapsed between the injury claimed and the onset of disability, as so often happens in cancer cases where after diagnosis is made the patient then recalls a forgotten or unimportant injury as the causative factor. Previously, and coincident with the presentation of these claims, there have been a great number of claims presented involving severe injuries to the spine, with shock, fracture compression and distortion, although few, if any, of these have involved injury or destruction of the intervertebral disc. In the discussion of disc-injury cases currently presented with various physicians treating them, claims men and attorneys have been advised that, although there has been but limited research in this country, foreign investigation has shown postmortem evidence of disc rupture in many spines with no history of trauma. If, then, certain of these ruptures are wholly traumatic, if certain ones result merely from minor trauma to a previously diseased disc, and if others are due solely to progressive degeneration, it is important to establish these several facts before legal liability can be determined.

FIRST GROUP

Where there is a severe trauma with immediately resultant disability, and a ruptured disc is found to be the cause of such disability, there can be little question that industry is responsible for the medical treatment necessary to relieve the disabling condition and for monetary benefits to the employee while he is temporarily disabled. In such a case of severe injury and immediate disability the burden would certainly be upon the employer to show that the employee suffered some preëxisting disease contributing to the disability as a causative factor. Even then the liability of the employer would be reduced, if at all, only as to any permanent disability the employee might have, after all reasonable medical treatment had been rendered. But "severe trauma" means just that; not some normal or slightly unusual occurrence magnified to form the basis of a claim.

SECOND GROUP

Where a minor strain or trauma immediately precedes disability, and a ruptured disc is found to be the cause of such disability, then there is doubt as to whether there is any industrial liability and, if there is, the extent of such liability. The certainty and adequacy of the trauma should first unquestionably be established. It should be something more than an ordinary bodily movement or bodily contact without any added strain or trauma due to the peculiar requirements or hazards of the employee's work. If the adequacy of the injury immediately preceding the disability is established, the presumption would be that it was probably a contributing causative factor in producing the rupture. If it is established as such, the employer would be required to furnish all medical treatment reasonably required to cure and relieve from the effects of the injury.

Once all reasonable medical treatment was rendered, should the employee have persisting permanent disability it would be necessary to determine whether this permanent disability was greater than any he would have had in absence of the injury. To determine this it would be necessary to know what, if any, abnormal pathology existed prior to the injury, and would later have existed in absence of the injury; in other words, whether the ruptured disc was diseased or degenerated and, if so, to what extent at the time the injury was sustained. If it was diseased, had the employee a vulnerable back which should not have been subjected to excessive flexion or strain? Is his back any worse after injury and treatment than it would have been had he not been injured? If he has merely received conservative treatment, has his spine returned to the same condition as previously existed? If he has had a laminectomy, a fusion, or both, is his permanent condition better, the same, or worse than it would have been in absence of the injury and the surgery?

If his condition is no worse, then the employer should not reasonably be held for any permanent disability. For example, if an employee with degenerated discs should not do work involving lifting, bending or twisting, and such work would probably result in disability, his condition would not be impaired by a laminectomy and fusion, giving him a painless but partially rigid spine. In fact, in such instance he would probably be better off as to working ability, and the diseased condition would be eliminated as well. excluding the probability of future total incapacity due to its natural progression.

The nature and extent of medical treatment to be rendered in the event of a disc rupture due to injury is a question only of what is reasonable: whether it be conservative or surgical and, if the latter, the extent thereof, whether laminectomy or fusion or both.

THIRD GROUP

The third possible classification involves those cases which are nonindustrial or not attributable to injury; those cases where rupture occurs merely because of the progression of a diseased condition or degeneration of the disc. The mere fact that this rupture may occur on the job while the employee is doing his usual work would not entitle him to any benefits, monetary or medical. These cases would of necessity be distinguished by the absence of any adequate immediate injury and by the presence of degenerative pathology. Whether the former (the inadequacy of injury) would establish the latter (the presence of disease) is a consideration to be taken into account. Certainly, to a layman's mind the occurrence of rupture in absence of apparently adequate injury would point to a degenerative process as the sole causative factor.

But it will be important to affirmatively establish the presence of disease or degeneration in these cases apart from the history or absence of history of injury. This is particularly true where disability follows a doubtful or minor trauma. It is obvious that a patient's history, with the liability of the employer dependent on it, will often be open to serious question. Hence, if the diseased condition can be demonstrated by x-ray, clinically, surgically, or pathologically apart from and independent of the history, it will be of the utmost importance. History of severe trauma can often be woven out of whole cloth without possibility of contradiction. Normal acts and occurrences which would pass entirely unnoticed by an employee and his coworkers will, due to natural human reactions, assume monumental importance if the employee becomes disabled at or subsequent to the time they occur. If, therefore, reliable standards of diagnosis to determine the presence or absence and the degree of degeneration can be established apart from history, the major portion of the problem will be solved.

ACTIVE INTERSTITIAL KERATITIS OF LATE PRENATAL SYPHILIS: ITS TREATMENT*

By C. Russell Anderson, M.D.
and
Warren A. Wilson, M.D.
Los Angeles

Discussion *by Harold F. Whalman, M.D., Los Angeles; William A. Boyce, M.D., Los Angeles.*

Interstitial keratitis is one of the most distressing, and one of the most common manifestations, of late prenatal syphilis. That it can be prevented is shown by the Coöperative Clinical Group,[1] who found that, among 243 patients adequately treated for prenatal syphilis (with at least sixteen injections of an arsenical and thirty-one injections or weeks of rubs of heavy metal) before the onset of interstitial keratitis, only five (or 2.1 per cent) subsequently showed it. On the other hand, of 884 patients with untreated syphilis, 314 (or 36 per cent) sought treatment because of interstitial keratitis.

THE THERAPEUTIC PROBLEM

Once that interstitial keratitis manifests itself, the syphilologist and the ophthalmologist are faced with a therapeutic problem. Should they treat the patient with routine intensive therapy with the arsenicals and heavy metals, or should they supplement this with nonspecific therapy, such as intramuscular injections of boiled milk, intravenous injections of typhoid-paratyphoid vaccine, malaria or artificial fever? The fact that nonspecific therapy is so widely used in the treatment of interstitial keratitis is an expression of the dissatisfaction of many with the usual chemotherapy.

Nonspecific Therapy.—Nonspecific therapy, with boiled milk or typhoid-paratyphoid injection, is well known and an accepted procedure in resistant keratitis.[1, 2] Malaria has been successfully used since 1928 by Schreiber,[3] Marchesani,[4] Albrich,[5] Kundratitz,[6] Granstrom,[7] Miller,[8] and Dennie, Gilkie and Pakula.[9] In 1934 Ambler and Van Cleve[10] reviewed the literature on the use of malarial therapy, and reported the use of malaria, in seventeen cases of interstitial keratitis during a six-year period, with gratifying results. They felt that malaria possessed a distinct advantage over any known treatment. In their series two cases suffered relapses—one a month after malarial therapy with rapid response to typhoid-paratyphoid injections, and the other two months after malaria therapy and responding to three injections of boiled milk. Five of their patients had only one eye involved when malarial therapy was instituted; in none did the other eye become involved. Cole[2] also has recently recommended malaria, especially in old resistant keratitis.

Chemotherapy.—On the other hand, Stokes,[11] Carvill and Derby[12] and Carvill,[13] Robinson,[14] and the Coöperative Clinical Group[1] have reported satisfactory results with chemotherapy. Moore,[15] although having no personal experience with nonspecific measures, believes that those who resort to nonspecific therapy do so because of their failure to make the antisyphilitic treatment intensive enough.

Authors' Procedure.—Impressed with the report of Ambler and Van Cleve,[10] and dissatisfied with the usual chemotherapeutic procedure in the treatment of interstitial keratitis, beginning in July, 1936, we added malarial therapy to our armamentarium, along with intravenous typhoid-paratyphoid injections. Since then, we have administered fever therapy to twenty-two patients, sixteen of whom received malarial therapy and six intravenous typhoid-paratyphoid injections.

The youngest patient was four years of age and the oldest forty-four years of age. There was one patient in the first decade, sixteen in the second, two in the third, two in the fourth and one in the fifth decade. Fifteen of the patients were women or girls, and seven were men or boys. There were thirteen Mexicans, five Negroes, three whites and one Chinese.

---

* From the departments of Dermatology and Syphilology, and of Ophthalmology, of the Los Angeles County General Hospital.

A preliminary report with special reference to the use of malarial treatment.

Read before the Dermatology and Syphilology Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

Six of the twenty-two (or 27.2 per cent of the patients) had negative serologic reactions of their blood. This immediately suggests that all individuals with latent prenatal syphilis, regardless of the serologic reaction of the blood, should have treatment, probably as outlined by the Coöperative Clinical Group, for acquired late latent syphilis. No patient had clinical evidence of neurosyphilis, although two had positive spinal fluids of meningovascular type. All had some stigma of prenatal syphilis, although only sixteen had Hutchinsonian incisors. Only three of the patients had had antisyphilitic treatment before the onset of the interstitial keratitis, and all of it extremely inadequate.

Under the classification of the Coöperative Clinical Group,[1] the time limit for acute lesions is set at two months or less, and chronic lesions are classified as active manifestation of duration longer than two months. The Coöperative Clinical Group[1] found that the acute stage of interstitial keratitis usually responded to the first few injections of arsphenamin and to treatment with a heavy metal. There immediately arises the question as to whether our use of fever therapy is justified in cases of acute interstitial keratitis? On examining our twenty-two cases, we found that seven were seen in the acute stage, and antisyphilitic treatment with arsphenamin and heavy metal instituted. Six of these received continuous antisyphilitic treatment for periods of from two to six months without relief before fever therapy was instituted, and during this interval there was involvement of the second eye in three cases. The seventh patient had three relapses during a four-year interval, in spite of vigorous treatment, and negative serologic reaction on the blood. Incidentally, all seven responded immediately to fever therapy. Six were given malarial therapy, and one—a four-year-old child—was given typhoid-paratyphoid vaccine intravenously. Three of these patients were followed for one year or longer. Two had complete clearing of the corneas. The third had complete clearing of one cornea, minimal residual opacities remaining in the other cornea.

PROCEDURE

A course of malaria consists of from eight to fourteen paroxysms. Usually intravenous typhoid-paratyphoid injections are given to the patient after inoculation until malaria paroxysms appear. After completion of a course of malaria, antisyphilitic treatment is started with an arsphenamin. A course of typhoid-paratyphoid consists of from eight to twenty paroxysms of 103° or over. The treatment time was prolonged in some cases because satisfactory rises in temperature were not consistently obtained in each administration of the vaccine. With the vaccine course an arsenical is administered, usually at five-day intervals. We intend to treat all patients for a minimum of two years after subsidence of the active stage of the keratitis.

Local treatment in the acute stage consists of hot compresses to the eyes every two hours, and the instillation of a solution of atropin sulphate (usually 2 per cent)—two drops three times a day. As soon as all ciliary injection has disappeared, dionin is started. This is given by instillation of two drops of a 2 per cent solution twice a day for a week, increased to 5 per cent for a week, then 10 per cent for another week. Recently we have been using an insufflation of dionin powder once or twice a week for several weeks after the above series is completed.

All cases seen in the eye department are diagnosed on the basis of slit lamp and biomicroscopic examinations only. The progress and final result are made on the same basis, plus visual acuity with and without refraction.

REPORT ON CASES

There were thirteen acute cases. Of these, three were treated with typhoid-paratyphoid vaccine alone. Two of these three had a degree of activity not severe enough to justify malaria, and there was a satisfactory response to vaccine alone. The third had a severe bilateral interstitial keratitis. She was inoculated with malaria, but paroxysms did not appear, and we resorted to vaccine. The keratitis ran a stormy course, and although the patient received twenty satisfactory chills and fever plus arsenicals, the keratitis did not subside until the end of the third month. The keratitis has improved steadily, and the eyes are quiet at the end of the seventh month.

Ten of the acute cases had a satisfactory course of malaria, with immediate response of the keratitis after a few chills. Five of these remained quiet and improved over periods of one month to one year. One who had had a bilateral keratitis had completely clear corneas at the end of a year. Two had relapses six weeks and ten weeks after the end of the malarial course, but both responded to a few injections of typhoid-paratyphoid vaccine. One of these two had entirely clear corneas at the end of an eighteen-month period. Two had extension to the second eye without relapse in the previously affected eye, at the end of three-month and four-month periods, respectively, after malarial therapy. The acute keratitis subsided at once in both patients after five injections of typhoid-paratyphoid vaccine. One patient had both a relapse in the previously affected eye and extension to the second eye ten weeks after malaria. Continued administration of the arsenical, together with typhoid-paratyphoid vaccine, produced no subsidence of the interstitial keratitis in either eye during a one-month interval. We were unable to elicit satisfactory elevations of temperature with typhoid-paratyphoid vaccine in this patient. Because of previous success with malaria and at the patient's request, reinoculation with malaria was done five days ago.

Chronic Cases.—There were nine chronic cases. Three of these patients were treated with typhoid-paratyphoid vaccine alone. One of them was a four-year-old girl with bilateral interstitial keratitis of five months' duration. Eighteen months later the eyes were clear and no opacities were present. The second, a negress with a unilateral keratitis of six months' duration, failed to develop paroxysms after inoculation with malaria. Satisfactory chills and fever were not obtained with typhoid-paratyphoid vaccine, and the patient left the hospital against advice. Although the eye remained quiet, there was no regression of the opacities after four months of antisyphilitic treatment. The third, a case of bilateral interstitial keratitis of six months' duration, had an excellent response to typhoid-paratyphoid vaccine injections, although previous treatment with ten arsenicals had failed to produce any relief. One eye was entirely clear a year later, and the other showed a few small opacities.

Six of the chronic cases were treated with malaria. Four of these six cases were of five months to four years' duration. In all four the acute process subsided quickly, and there was a steady improvement in the keratitis. Of the remaining two cases, one was of eleven years' duration, and one of over five years' duration. Both had considerable scarring of the corneas. In both there had been some activity a short time before being seen by us. The former disappeared from observation one month after finishing his course of malaria, unimproved. The latter was still unimproved after six months in spite of continued antisyphilitic treatment.

COMMENT

The striking thing about the use of malaria is the rapid response of the keratitis. Photophobia, lacrimation and pain quickly subside after the first few paroxysms. Ciliary injection also is often gone by the end of the course of malaria, although it may persist for two to three weeks. By the end of the course of malaria, vision is often markedly improved, and infiltrations in the cornea are beginning to regress. All sixteen cases treated with malaria showed marked improvement, except the two patients with chronic interstitial keratitis of five and eleven years' duration, respectively. Although five patients suffered relapse or extension six weeks to three months after malarial therapy, four of them quickly responded to supplementary typhoid-paratyphoid injections. The fifth, as already mentioned, did not obtain satisfactory elevation of temperature from typhoid-paratyphoid injections, and was reinoculated with malaria.

It has occurred to us that, following the malarial therapy for acute cases, it might be wise to give the patients weekly injections of boiled milk for, possibly, two to three months in an attempt to prevent relapse.

Of the six patients who received only typhoid-paratyphoid injection with chemotherapy, two had been inoculated with malaria, but paroxysms did not appear. One of these two had a particularly severe interstitial keratitis, and response to the vaccine and chemotherapy was slow, requiring three months for subsidence of the acute stage. The other received no benefit from typhoid-paratyphoid vaccine, because of inadequate temperature elevation and a short course. The remaining four had a degree of activity which did not require malarial therapy; and although the response was slower than with such therapy, there was an ultimate satisfactory reaction to treatment.

It must be emphasized that the patients who received malarial therapy were suffering from a far more severe keratitis than those who received typhoid-paratyphoid vaccine alone, and that malarial therapy produced a much more rapid response to treatment than did the vaccine-plus-chemotherapy.

Although some of the patients have been under observation for only a few months, we believe that ultimately a satisfactory result will ensue in all of the cases treated, with the exception of the two mentioned above. Regression of the opacities and vascularization continue for a year or longer. It seems logical that the shorter time an acute process exists, the less scar tissue will form, and hence the less impairment of vision. At least, the remaining vision will stand a better chance of being restored to approximately normal with lenses. The above facts are self-evident if compared with statistics from the Los Angeles City Venereal Disease Clinic, where cases of interstitial keratitis are treated with the accepted type of chemotherapy only, and where it takes months for a case to become quiescent.* We intend to present a further report after a period of two years.

Certain points are noteworthy in this series. There were no cases of absolute blindness, nor were there any in which vision was reduced to light perception only. Most of the cases have 20/200 to 20/100 vision, and this, of course, can be improved with lenses. We have not been able to refract all of these cases because of difficulties in the way of social service. Furthermore, in cases with residual scars, it was not felt that it would be optically sound to give a rather strong myopic correction when the other eye was essentially normal, as there might be a tendency to aniseikonia. Then, too, patients in the younger age group (under eighteen) may obtain a good visual result such as 20/30 under atropin, but on postcycloplegic examinations this would be reduced to 20/100 because of central opacities and, with one normal eye, it was not deemed advisable to do an optical iridectomy on the affected eye; this latter procedure being resorted to in old, treated quiescent cases with bilateral involvement and markedly reduced visual acuity.

IN CONCLUSION

We believe that malarial therapy is a valuable addition to the therapeutic armamentarium in the treatment of both acute and chronic interstitial keratitis. Whether it will be a permanent addition depends on the results of treatment of new cases and the continued observation of previously treated cases over at least a two-year period.

DISCUSSION

Harold F. Whalman, M. D. (727 West Seventh Street, Los Angeles).—I have had the opportunity of seeing most of the cases which these authors have described and have examined many of them from time to time with the slit-lamp. As a result of this personal observation, I am impressed with the importance of heroic treatment of interstitial keratitis in its acute stage.

I have watched, for the past ten years, the treatment of a large number of cases of interstitial keratitis by the usual means of chemotherapy and gained the impression, as have many others, that there seems to be very little influence of such treatment on the course of interstitial keratitis.

From a pathological standpoint, interstitial keratitis may be described in four stages.

First, the stage of infiltration, characterized by the invasion of the cornea by spirochetes, resulting in an edema of the innermost layers of the substantia propria and swelling of the endothelial cells. Nodular areas form and become necrotic, and wandering cells begin to make their appearance.

In the second stage, this avascular vulnerable tissue becomes supplied with blood vessels which grow into the deeper layers first, gradually encroaching upon the center of the cornea, and later anastomosing with conjunctival arcades which have now invaded the middle or the anterior third of the cornea. These vessels are arranged in a rather characteristic palisade all around the cornea.

The cornea is now greatly thickened and the posterior layers are beginning to show considerable sclerosis, while great radial folds are noted in Descemet's membrane. This third stage is sometimes greatly prolonged.

Finally, following the more or less complete vascularization of the cornea and accumulation of the products of inflammation resulting in the thickening of the cornea, there is a stage of restoration in which destroyed tissue is replaced by scar, the blood vessels collapse and the cornea returns to approximately normal thickness. The blood vessels remain patent and fill with blood during any subsequent irritation of the eye. These vessels are pathognomonic of a previous attack of interstitial keratitis.

From the standpoint of preservation of vision, treatment of this condition must be efficacious during the first stage, and must put a prompt end to the cellular invasion taking place. Otherwise, in the later stages of sclerosis of the cornea, such opacification will result as to seriously impair vision.

Nonspecific therapy is the only treatment that has accomplished this important step. Harvey Howard, working in the great clinic of the Rockefeller Institute at the University of Peiping, made use of intravenous typhoid inoculations for this purpose in cases of interstitial keratitis as well as other kinds of ocular inflammation. A number of authors have substantiated this work, and a few cases with which I had early experience were reported in California and Western Medicine in December, 1931. This method, as the authors have pointed out, still has its place in the treatment of interstitial keratitis. However, their present report on the use of malaria as a nonspecific agent, indicates that its efficacy is very great and that it is a convenient and safe method of attacking a condition which may be so disastrous as to produce blindness.

I can confirm the authors' experience in receiving a negative Wassermann report at the beginning of many of these cases, so that it is important to be guided by accurate history and other clinical evidence. One such case in which vascularization was delayed until six weeks after onset, I mistook for a case of tuberculous keratitis. Tuberculin was administered without effect, and only after starting antiluetic treatment did the Wassermann return positive.

The authors are to be congratulated on presenting this important addition to the treatment of interstitial keratitis, and I am looking forward to hearing a further report from them as to the final visual results in an even larger series of cases.

William A. Boyce, M. D. (1210 Roosevelt Building, Los Angeles).—I have been very much interested in watching the results of the treatment of interstitial keratitis as outlined by Drs. C. Russell Anderson and Warren A. Wilson. I was fortunate in having the opportunity to see these cases before and after treatment, and the way they have responded to treatment has been most interesting and gratifying.

In the past it has been felt that every case of interstitial keratitis must run its course and that it was not influenced by constitutional treatment, and there was a certain percentage of corneas that were permanently damaged.

I consider that this treatment as outlined is a great advance in medical science, affording a ray of hope that we can pass on to our patients that something can be done to clear up these corneas rapidly and thereby give them more assurance of being able to preserve their vision.

I desire to congratulate Doctors Anderson and Wilson for their thoroughness and scientific manner in which they have attacked this problem.

THE LURE OF MEDICAL HISTORY†

TRUTH OVERTAKES "DOCTOR HUNTER"

By A. W. Meyer, M. D.
Stanford University

PART II*

AUTHOR'S DISCUSSION

SINCE, as stated above, William said that Haller credited him with the "discovery" of the independence of the fetal and maternal circulations, in 1766, it seems all the stranger that this idea was not given explicit expression in the "Gravid Uterus," which appeared eight years later. It also is noteworthy that Haller did not adopt William's idea in the third edition of his *Primæ Lineæ,* in 1767, but maintained the idea expressed by him[self] in the edition of 1751, and found even in the German edition of 1788 and the English edition of 1801, in which one reads as follows: "This communication of fluids between the uterus and placenta seems to be demonstrated . . . lastly, from the passage of water, quicksilver, tallow, or wax, from the uterine arteries of the mother into the vessels of the placenta, as observed, and lately confirmed by eminent anatomists." (Pp. 437–38, Section 891.) Two eminent anatomists who thought that they had proved this, according to Fasbender, were Cowper (Bidloo's Anatomy, given out by Cowper at Oxford in 1697, in his own name) and Noortwyk (Uteri humani gravidi anatomia et historia, Lugd. Bat., 1743).[8]

In *A History of Embryology,* Needham[9] stated that Haller ". . . followed Noortwyck in asserting the separateness of the maternal and fœtal circulations in mammalia." However, as already intimated, William Hunter, Fasbender (1906) and

---

† A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

* Part I of this paper appeared in the issue of February, 1939, page 120.

[8] California and West. Med., Vol. 45, No. 6, p. 493, col. 1, par. 1, line 2 (Dec.), 1936.

[9] Needham, Joseph: A History of Embryology, p. 201. Cambridge, 1934.

Siebold[10] (1902) attributed the opposite view to Noortwyck[11] with respect to man. I regret that the original publication of Noortwyck is not accessible to me, but Fasbender quotes the following unambiguous words from it: *dubitari demum non posse de immediata communicatione vasorum uterinorum cum ovi vasis, quoniam materies, per ramum art. iliac. immissa, in vasa placentæ et chorii profunde penetraverat.*[12] (Immediate communication of the uterine vessels with the vessels of the ovum certainly cannot be doubted, inasmuch as material sent through a branch of the iliac artery penetrates deeply into the vessels of the placenta and the chorion.)

I fully realized that the above quotations from my brief articles did not and could not finally resolve the question at stake between the two brothers, but I have since come upon words written by William himself which do so with finality.

LETTERS OF WILLIAM AND JOHN HUNTER

In order to give full force to these words, it seems best to give, first, the letters written to the Royal Society by the Hunters. They are a matter of history and specifically call attention to the point at issue. It may be recalled that these letters were occasioned by John's contribution, of 1780, to that Society. William wrote to the secretary, apparently Paul Henry Maty, M.A., saying:

Windmill Street, Feb. 3, 1780.

Dr. Hunter begs the favour that the Secretary to the Royal Society will read to the Society what follows.

Mr. Hunter's account of the structure of the human placenta, explaining the connexion and circulation between the mother and fœtus in utero, which was read at the last meeting of the Royal Society, informs us that it was a discovery which he made with Dr. Mackenzie, and that it was not claimed by me. The Society will be sensible that I am reduced to the necessity of taking notice of this mistake, when they are informed of the following facts:

First. That the doctrine has been many years ago published in printed books as my discovery, and had been communicated as such by myself. See Baron Haller, for instance, in the second part of the eighth volume (p. 220) of his great Physiology in quarto, printed thirteen or fourteen years ago.

Secondly. Besides treating of it as my own discovery in my lectures on the subject, I have always done so, for many years past, in the very first lecture of my course, which is the most public of all, because the door is then open to every person whose curiosity prompts him to be present.

In the third place, occasionally in what I have printed, and in my lectures, I hope I have not overlooked opportunities of doing justice to Mr. Hunter's great merits, and of acknowledging that he had been an excellent assistant to me in this and in many other pursuits. By doing so, I always felt an inward gratification, shall I call it, or pride? I have given him all the little anatomical knowledge that I could communicate, and put him into the very best situation that I could, for becoming what this Society has, for some time, known him to be. May it be presumed then that I stand possessed of the discovery in question, till proofs shall be brought to dispossess me? I shall most willingly submit to the pleasure of the Society; if they signify an unwillingness that this emulation (shall I call it?) should go on, I shall acquiesce, and be silent. If curiosity, justice, or the laws and practice of the Society should incline the Council to seek out and determine upon the merits, I shall be equally ready to obey their commands. And if it should appear reasonable to them, I would first beg to know the grounds of Mr. Hunter's claim, as I am too well acquainted with his abilities not to think that he must be able to support his claim by something that I am ignorant of. And if I should receive that satisfaction, I shall immediately show that I am more tenacious of truth than even of anatomical discoveries. But if that information should not alter my thoughts on the question, I shall show to the satisfaction of the Society, if I can at all judge of my own employments and pursuits, that my pretensions arise out of a long series of observations and experiments made with a view to the discovery in question; that it was not a random conjecture, a lucky thought, or accidental occasion, but a persevering pursuit for twelve or thirteen years at least, the progress of which was always publicly known here, and admits of the most circumstantial proof.

William Hunter.[13]

* * *

John's response to William sent to the president of the same society, apparently Sir Joseph Banks, was as follows:

Jermyn Street, Feb. 17, 1780.

To the President of the Royal Society.

Sir,—Though I know the constitution of the Society over which you preside too well to suppose that they will give their judgment on any subject, and respect it too much to think it a proper field for waging the war of controversy, I cannot avoid requesting you to lay before that learned body a short answer to the paper given in by my brother, Dr. Hunter; as silence on my part, after his charge, may be interpreted by my enemies into an acknowledgment that I have intentionally claimed to myself a discovery in reality his due. I am as tenacious as he is of anatomical discovery, and, I flatter myself, as tenacious also of truth. The discovery was made in the manner in which I stated it in my paper. Dr. Mackenzie had injected the subject, and being unable, as I conceived, to explain an appearance which he had found in dissecting it, sent for me. I came to him, and having examined it further, explained the appearance in question, then, for the first time, to my own satisfaction and that of Dr. Mackenzie; and in the evening of the same day, full of the discovery, I came to Dr. Hunter, and brought him with me to Dr. Mackenzie, to see and judge of the explanation I had given and Dr. Mackenzie had agreed to. This is my state of the fact upon which I ground my belief of myself being the author of this anatomical discovery; but as my brother thinks differently, after a period of twenty-five years, I am content to abolish all remembrance of the successions of time in the course of that day, and to suppose that Dr. Mackenzie, Dr. Hunter, and myself inspected the parts together, and made the discovery, by which means the honour of it will be divided into three, one of which I may surely be allowed to take to myself, the other two may appertain to Dr. Mackenzie and Dr. Hunter, if they choose to claim, and be content with them; though in this division we must make some reserve for the claims of several ingenious young men, at that time pupils, who were with us, and of course entitled to some proportional share in the discovery, though their present situations, settled at a distance from this town, have prevented them from getting early notice of this present claim, and of course of making application to the Society for their share. However, I may here declare that if Dr. Hunter will produce to me any claim, which I can allow, of his having discovered this anatomical fact at any period of time prior to this conference at Dr. Mackenzie's, I shall first declare, in excuse for having troubled the Society, that I was not before acquainted with it, and immediately after declare that he is entitled to the sole honour of it, at least in preference to myself.

I am, Sir,

Your much obliged, and most obedient humble Servant,

John Hunter.[14]

COMMENT ON THE LETTERS

In regard to the first point in William's letter, it should be noted (1) that he mentioned no book in which his discovery was acknowledged except that of Haller, which contains no such acknowledgment, but refers instead to the page in William's *Medical Commentaries* containing a footnote in which the contrary opinion is vigorously defended; and (2) that he failed to say to whom he communicated his discovery unless he meant the public spoken of in "Secondly." This recalls to mind the comment of Paget, in the case of the quarrel between the Hunters and Pott, that William had recourse to rhetoric while John gave "a plain statement of all that he remembered."

(To be continued)

DEATH OF "DR. O. UPLAVICI"

By W. H. Manwaring
Stanford University

IN 1887 Dr. Jaroslav Hlava of Czechoslovakia reported the discovery of amebas in the stools and intestinal ulcers of patients suffering from dysentery, together with his success in transferring the disease to laboratory animals (cats) by intrarectal inoculation with human ameba-containing stools. His paper was published in the leading Czech medical journal of that day, under the title: "O uplavici; Predbezne sdeleni." ("On dysentery; a preliminary communication.")

By some unexplainable editorial oversight, Dr. Hlava's name was omitted in the German reviews of his paper. Credit for this basic medical discovery was, therefore, given to "Uplavici, O" (Dysentery, On).[1]

For fifty years international medical science paid homage to the mythical bacteriologist, "Dr. O. Uplavici," ranking him with Pasteur, Koch, and Lister, as one of the outstanding pioneers in modern medical science. It was not until a year ago that the mythical nature of this nineteenth century protozoölogist was recognized by Dr. Clifford Dobell of London, England, and a formal obituary of "Dr. O. Uplavici (1887-1938)" published in a leading English medical journal.[2]

While the creation and perpetuation of the "Uplavici" myth has probably neither hastened nor retarded the development of bacteriological science, Doctor Dobell's obituary may have a salutary effect on future medical historians. There are a number of other minor literary myths still honored in medical research literature, most of them of fairly recent Russian or oriental origin.

Seldom shall we see in cities, courts, and rich families, where men live plentifully and eat and drink freely, that perfect health and athletic soundness and vigor of constitution which are commonly seen in the country, where nature is the cook and the necessity the caterer, and where they have no other doctor but the sun and fresh air.—South.

CLINICAL NOTES AND CASE REPORTS

CEREBRAL EDEMA

INJECTION OF AIR INTO THE SPINAL CANAL AS A THERAPEUTIC MEASURE

By George H. Sciaroni, M.D.
and
K. F. Sharp, M.D.
Fresno

PREVIOUS reports on the value of spinal puncture as a therapeutic measure in the treatment of cerebral edema have confined themselves to a discussion of the procedure as a means of decreasing intraspinal pressure by withdrawing small quantities of spinal fluid at certain intervals. This may or may not give the patient some relief from the distressing symptoms of increased intracranial pressure. We know that many cases of cerebral edema fail to show any appreciable increase in the pressure of the spinal fluid. This is particularly noticeable in some cases of epidemic encephalitis and brain concussion. Many of the varieties of encephalitis may fail to show increase in the pressure of the spinal fluid, as we have had occasion to observe in the patients we have seen in the San Joaquin Valley.

The usual method of treatment of these patients has limited itself, to some extent, to the use of hypertonic solutions of glucose, sucrose, magnesium sulphate, etc., intravenously. One of us, Dr. G. H. Sciaroni, has been using air injections into the spinal canal for a number of years as an important addition to the intravenous use of hypertonic solutions. The procedure he has used, and that we will describe here, demonstrates its value, not by decreasing spinal fluid pressure, but by deliberately increasing pressure within the cranial cavity. The patient is usually seated in an upright position, and a spinal puncture is done. No fluid is removed, but a small quantity of air, usually 20 to 50 cubic centimeters, is injected into the spinal canal, and this air rises to the cranial and ventricular cavities, where it exerts pressure on the brain, compressing the tissue and forcing the fluid out of the brain and into the blood vessels. Hypertonic glucose solution, 50 cubic centimeters of 50 per cent glucose, is usually given intravenously just preceding the spinal puncture, and we have noticed some unusually good results. Many of the patients treated in this manner were so seriously ill before air injections were begun that their prognosis was almost hopeless, and we have seen these patients make rapid and complete recoveries, showing improvement almost at once after air injection into the spinal canal was begun.

As we have mentioned, this form of treatment has been used for some time by Doctor Sciaroni, particularly during the spidemics of encephalitis in 1933 and 1934. His results were exceptionally good. We are reporting this more recent case of encephalitis because of many unusual features, the most remarkable of which was the rapid improvement shown by the patient as soon as air injections were started. His condition before that was extremely grave, and he made a rapid and continuous recovery as soon as air-injection treatment was instituted.

REPORT OF CASE

Mr. Ernest R., age 38, ranch laborer, married, father of five children. Past medical history essentially negative.

Present Illness.—The patient noticed some headaches for three days prior to admission to the hospital on August 6, 1938, but had continued working on his ranch because he did not consider the headache particularly significant. The night before his admission he developed a fever, but he did not know how much; he felt extremely weak and had rather severe pains in his back. A physician was consulted the next morning, as his illness continued to become worse, and he was sent to the hospital at once. His temperature on entrance was 104.6 degrees. He was acutely ill, semistuporous and irrational, and was troubled with frequent involuntary urinations. A negative Widal reaction ruled out the possibility of a typhoid infection. He had a leukocyte count of 13,400, 26 per cent of which were large lymphocytes, and urinalysis showed the findings negative except for a high degree of acidity. The patient was given a sedative and was started on a daily regimen of potassium citrate, 20 grains three times a day.

On the second day he was worse. He began having involuntary defecations as well as urinations, he was very drowsy and more irrational than on the previous day, and a spinal puncture was decided on for diagnostic purposes. The spinal fluid was under no increased pressure. The laboratory reported a white cell count of 229 per cubic millimeters of fluid, 96 per cent of which were young polymorphonuclear leukocytes. On the following day he was unable to take any food, he was more irrational, and had developed a tremor in both arms. His temperature did not go above 101.6 degrees during the dav. Treatment that day consisted of intravenous hypertonic glucose, 50 cubic centimeters of 50 per cent glucose, and some Hartmann's solution subcutaneously later in the day. On the fourth day after entrance he developed a severe quivering of the entire body, and was unable to swallow. His general condition became serious. The next day, the fifth after entrance, he was given 50 cubic centimeters of 50 per cent glucose, intravenously, and received his first air injection. A spinal puncture was done as soon as he had received the glucose, and the spinal fluid was seen to be under no great pressure. Without removing any spinal fluid, 20 cubic centimeters of air were injected. The patient made some improvement that day, and spent a more comfortable night. The entire procedure was repeated the next day, 20 cubic centimeters of air being injected a second time. Later, that same day, the patient's improvement was very noticeable. He began to eat liquid foods, became more rational, had a temperature less than 100 degrees all that day and night, and was less troubled by involuntary urinations. There were no involuntary defecations after that day. On the following day the procedure was repeated a third time, the patient getting 30 cubic centimeters of air into the spinal canal instead of 20 cubic centimeters as on the previous two days. He started to eat well, and ceased to void involuntarily.

On the following two days he received no air injections, and received no hypertonic intravenous solutions. He continued to show steady improvement and was eating a soft diet without difficulty. He suffered a relapse on the third day since discontinuing the air injections and the hypertonic glucose. He became irrational again, and had a return of his former symptom of involuntary passage of urine. His temperature rose to 102 degrees. On the following day there was a serious weakening of the pulse, and his condition became critical.

At that time another spinal puncture was decided on for the purpose of injecting air into the cranial and ventricular cavities. The patient was given 50 cubic centimeters of hypertonic glucose solution intravenously, and a spinal puncture was done. Without removing any fluid, 20 cubic centimeters of air were injected into the spinal canal. The patient showed improvement later that same day. He was more alert until late that night, when he became irrational again to a slight degree, and voided once involuntarily. He was noticeably better the next day, and continued to show improvement on each succeeding day. He had no more spinal punctures and no more hypertonic glucose solution after the single treatment given at the time of his relapse. He received no medication after that last injection, except some Epsom salts the second day. He was eating a general diet three days after the last spinal injection, and was sitting up in a chair after four days. He continued to make a steady uneventful recovery, and left the hospital three weeks after his admission. His subsequent history has shown almost complete recovery, and he has begun work on his ranch.

CONCLUSIONS

1. It is our opinion that a great number of patients having encephalitis who now die will recover if this treatment is properly pursued.
2. This suggests a new treatment for cerebral concussion, cerebral hemorrhage, etc.

1410 Pacific Southwest Building.

MIKULICZ'S DISEASE

A CASE REPORT

By Alfred C. Reed, M.D.
and
Francis Rochex, M.D.
San Francisco

In 1892 Mikulicz [1] described a clinical syndrome, characterized by a chronic, painless, uniform enlargement of the lacrimal and salivary glands in an individual with a normal blood picture. There was neither involvement of the lymph nodes nor of the spleen. Histologically the tissue resembled that of a lymphoma, in which the lymphoid hyperplasia lay between and compressed the secretory cells.

Some observers have noted that there may be no involvement of the lacrimal glands. Others have recorded the presence of exophthalmos associated with involvement of the lacrimal glands. There have been many and varied suggestions which have been offered regarding the possible etiologic factors. Favor has been given to the idea of a chronic infectious agent extending from the nasopharynx or operating from some distant focus. Many have stressed the importance of tuberculosis in the etiology, but the relationship has never been definitely established.

Mikulicz's syndrome is to be differentiated from atypical leukemia, chronic relapsing parotitis and simple hypertrophy of the glands. The glandular tissue often returns to its original size, following the administration of iodids or arsenicals. Roentgenotherapy is usually successful and surgery may be resorted to if other measures have proved ineffective.

REPORT OF CASE

Mrs. H. A., age 35, was first seen by us on January 27, 1938.

Chief Complaint.—Swelling of the parotid glands bilaterally, which had begun with a severe head and chest cold three years before, and had been gradually enlarging since. She also complained of amebic dysentery, for which she had been under treatment for seven years past, recurring arthritis, and a tendency to anemia.

Past History.—She was born in northern California, went to Brazil in 1930, and returned to northern California in February, 1932.

Diseases: There were no hereditary diseases in the family. She had some of the minor childhood diseases only, and at one time had an enlarged liver, with jaundice. Tonsillectomy in 1922 was followed by severe hemorrhage. In 1929 her appendix was removed and internal hemorrhoids were cauterized. She was always troubled with constipation. Following this operation she was found to be anemic.

In 1930, a few days after her arrival in Brazil, she had her first attack of dysentery, which was diagnosed as ptomain poisoning. For the following year and a half she was treated almost continually for anemia.

In October, 1931, she became very ill, and Entameba histolytica was demonstrated in the stool. Treatment was with stovarsol. During her stay in Brazil her weight dropped from 116 to 96 pounds.

In February, 1932, she returned to California. During the following year she suffered from arthritis, neuritis, and amebic dysentery. She took many antiamebic drugs, but no emetin. Her stools were last positive for amebas in 1933.

In May, 1934, her arm swelled from elbow to wrist, but no diagnosis was made as to cause. Later that same year she had influenza, followed by colds which persisted all winter. In February, 1935, following a very severe head and chest cold, she first noted swelling of the parotid glands, which swellings has gradually increased to date. At no time has there been any pain or soreness in the glands.

From February, 1935, to January 27, 1938, when she first came under our observation, she received much medical treatment for anemia and amebiasis, and some medication for arthritis.

In December, 1935, her hemoglobin was 75 per cent, red blood cells 4,500,000, and leukocytes 11,850. In July, 1936, the hemoglobin was 58 per cent, and this varied from time to time to January 24, 1938, when it was 62 per cent.

During this time she states that she took, among other medicines, at least eight courses of carbarsone, extralin, lextron, haliver oil with viosterol, tabloid reduced iron, salicionyl, potassium iodid dicalcium phosphate, and yeast. She was nervous, lacking in energy, could not stand crowds, and was troubled with occasional arthritis. In July, 1936, she suffered from extreme dryness of the mouth and throat, which was eventually relieved by dilatation of the ducts of the parotid glands. An x-ray of the sinuses and parotid glands at this time showed no evidence of pathology.

Physical Examination.—Temperature, 99.4 degrees F. Teeth were in poor condition. There was bilateral, moderately marked, uniform, painless enlargement of the parotid glands. The thyroid gland was palpable and soft. The abdomen was tender in both lower quadrants.

Sigmoidoscopic examination showed redness and excoriation of the mucous membrane, which was thickened between the valves. Smears for aerobic and anaerobic cultures were taken from this area. No deep ulceration was noted.

Laboratory Tests:

Blood Count: Red blood cells, 4,310,000; hemoglobin, 79 per cent, Sahli (12.5 grams); color index, 92; leukocytes, 6,280; polymorphonuclears, 70 per cent; lymphocytes, 27 per cent; mononuclears, 2 per cent; eosinophils, 1 per cent.

There was slight anisocytosis and poikilocytosis. Red cells showed achromia. (On March 15, the red-cell count and hemoglobin had risen to normal.)

Urinalysis: PH 6.0; specific gravity, 1.018; albumin (—); sugar (—); rare pus cell; rare epithelial cell.

Basal metabolic rate: 7.2 per cent minus.

Eriometer reading: 7.9 micra.

Gastric analysis: (Alcohol test-meal.)

	Free HCl.	*Total Acid*
Fasting specimen 20 cc. Slight bile	0.	4.
Specimen I. No bile	0.	3.
Specimen II	0.	4.
Specimen III	0.	3.

Stools: Black color, normal odor. Formed, firm consistency. No food remnants. No mucus. Good digestion. Occult blood negative. Dominant bacteria mostly Gram-negative rods. Microscopic examination entirely negative. No parasites nor ova seen. (Series examined, including three specimens after saline laxative.)

Cultures: Taken by sigmoidoscope from upper rectal and lower sigmoid mucosa. Results were as follows:

(1) January 28, 1938:

Aerobic: No typhoid-dysentery organisms. Positive for a mixed culture of B. coli and a few Alpha hemolytic streptococci.

Anaerobic: Also showed a mixed culture of B. coli and an Alpha hemolytic streptococcus. Also, Bacterium necrophorum was isolated, using Dack's technique. This was lost in subcultures.

(2) March 24, 1938:

Aerobic: No typhoid-dysentery organisms. Positive for a mixed culture of B. coli, Staphylococcus albus and Corynebacterium flavidum.

Anaerobic: Positive for a mixed culture of B. coli, corynebacterium flavidum, an Alpha hemolytic streptococcus and a Gamma hemolytic streptococcus.

Wassermann: Reported negative by the patient.

Roentgen Examination.—X-ray of the gastro-intestinal tract, with special study of the small intestine, by Doctors Ingber and Rodenbaugh, gave the following result:

"Fluoroscopic examination of the chest; no abnormality.

"The stomach outlines are smooth, peristalsis is not increased, and there is no delay in emptying. The antrum is not spastic. The duodenal bulb fills readily, smooth in outline, and empties normally. The course of the duodenum is regular.

"Films taken at fifteen minutes, thirty minutes, one hour, two hours, four hours, and six hours show normal distribution of the meal through the small intestines, and no abnormality is noted.

"At six hours distribution is normal, the stomach being empty.

"At twenty-four hours barium is well distributed throughout the large bowel. The cecum has begun to empty, is movable and not tender."

Biopsy.—A biopsy of the left parotid gland was done by Dr. Frederick Foote under local anesthesia. His report is as follows:

"Grossly, this enlargement appeared to be of the gland itself, with the tissue thrown up in nodules. On cutting through it, the gland appeared to be particularly meaty, with small areas of cystic dilatation. These small cysts appeared to contain saliva."

The tissue was sent to Dr. Jesse L. Carr for examination. His report follows:

"Sections show an effuse replacement of the gland by large fields of lymphocytes between which are small islands of cells which are larger, more pale staining, and closely knit. Through this whole mass run dilated salivary ducts which are filled with granular blue coagulum. No normal gland remains.

"Pathologic diagnosis: Mikulicz's disease."

Diagnosis: Mikulicz's disease; chronic colitis; achylia.

Further Course.—X-ray treatment of the parotid glands was followed by rapid reduction in size to normal.

COMMENT

The question arises as to whether the bacterial colitis and achylia may have had an etiologic relation to the parotitis. The achylia may have predisposed to abnormal bacterial flora in the colon. The colonic bacteria, especially some of the streptococci, may have been involved. Of this we have no proof. The upper respiratory infections immediately preceding the parotid enlargement are apparently more closely related to the parotitis. Failing recovery of bacteria from biopsy material from the affected glands, the question of bacterial relations cannot be settled in this case, and we did not think of biopsy tissue culture until too late.

CATASTROPHIES FOLLOWING HEMORRHOID INJECTIONS*

By James W. Morgan, M.D.
San Francisco

The injection treatment for internal hemorrhoids, when bleeding at stool is the only symptom, is based on sound therapeutic principles. In selected cases the results are excellent. Injection may sometimes be used as a palliative measure when the hemorrhoids protrude through the anal orifice. The technique of injection is not easy and requires much practice. All this has been said hundreds of times, but no one seems to have called attention to the disastrous sequelae which often follow hemorrhoid injections.

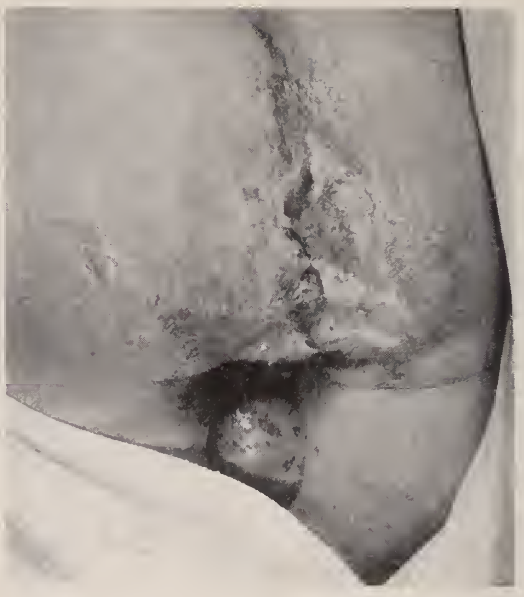

Fig. 1.—Photograph of the perineum of a male patient nineteen days after an injection treatment for internal hemorrhoids. The lower rectum and anus have sloughed away. The patient now has four anal orifices, with no control of bowels or bladder. This patient won a large award in a malpractice suit, but he has lost his rectum.

Gabriel reports a case of a patient with tubular stricture necessitating colostomy as a sequel to an injection treatment. Some rectal surgeons are opposed to any injections, and I predict that in the future we shall all use this treatment less frequently and with much greater discrimination.

The following is a summarized list of the more severe complications in patients who have come under my care following injection treatments:

A. Slough (chemical necrosis):
   1. Localized necrosis causing pain, but unattended by other sequelae.
   2. Generalized necrosis resulting in:
      (a) Mechanical hemorrhoidectomy.
      (b) Cellulitis, with sloughing of entire rectum and complete loss of control.
      (c) Septicemia.

B. Abscess (requiring surgical treatment):
   1. Local abscess.
   2. Anorectal fistula.
   3. Abscess terminating in chronic ulcerative proctitis and colitis.

C. Injury to contiguous structures:
   1. Rectovaginal fistula.
   2. Periprostatic abscess.
   3. Epididymitis.
   4. Vesiculitis with urethral hemorrhage.

D. Severe secondary hemorrhage.

I do not advocate hemorrhoidectomy in all patients with internal hemorrhoids. This operation is attended by some slight risk, and the patient needs to be away from his work for two weeks. The operation offers, however, the only cure, and injection treatments might do more harm than good.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

PYELITIS IN CHILDREN AND INFANTS

I. ETIOLOGY

Hartzell Harrison Ray, M. D. (23 Second Avenue, San Mateo).—Pyogenic infections of the urinary passages are manifested by pus in the urine coming from the kidney, the pelvis of the kidney, the ureters, bladder or urethra. In clinical pediatrics this condition has most frequently been called pyelitis.

Pyelitis occurs in children of all ages, and is estimated to constitute about one per cent of all illness seen in pediatric practice.[1] It is twice as common under two years of age as after that age.[2] It may occur in the first week of life, and is more common in boys.[1] Conrad[3] examined the urine of 190 consecutive newborn children and found that 39 had pus. Of these, 15 children had 15 to 20 cells per high dry field, 15 children had 20 to 60 cells, and 9 had 100 or more cells per high dry field. He was able to examine fourteen of his thirty-nine cases two years later and found only one that showed any pus. The finding of pus in the urine of newborns may not represent pathology, however, for it may be due to anuria or initial dehydration.

In infants as many boys as girls have pyelitis, while in older children it occurs three or four times as frequently in females as in males.[2] There is a very slight seasonal variation, pyelitis being seen more frequently during the seasons when gastrointestinal disorders and upper respiratory infections are present. The incidence of pyuria will also vary in different epidemics of gastro-intestinal and upper respiratory infections.

The presence of congenital abnormalities in the urinary tract are often the direct or indirect cause of pyelitis. This is especialy true in chronic pyelitis.[4] Those congenital abnormalities that prevent proper drainage of the urinary tract, or produce stasis, result more often in pyelitis. Hurt[5] found urinary tract abnormalities in 5 per cent of newborns that came to autopsy. Bugbee and Wollstein[6] reported that approximately 2.5 per cent of necropsies on children revealed congenital anomalies of the urinary tract. In a series of 2,420 autopsies, Campbell[7] demonstrated that 2 per cent of children had some degree of ureteral blockage, and one-half of these were types of ureteral stricture. Not all congenital abnormalities of the urinary tract are accompanied by pyuria; they may be only potential causes. Congenital fibrosis, kinking or stricture of the ureters, polycystic kidneys, double ureter, horseshoe kidney, muscular hypertrophy or atony of the ureters, or congenital narrowing of the caliber of the urinary tract chiefly at the point of normal anatomic narrowing, the uretero-pelvic, ureterovesical and vesical outlet, can cause pyelitis. At times there appears to be a neurogenic dysfunction or neuromuscular disturbance at the ureterovesical junction which can produce stasis and subsequent pyuria. Occasionally, pyelitis is seen where neurological lesions, either central or peripheral, involve the bladder, such as poliomyelitis, cerebrospinal syphilis, spina bifida and toxic neuritis.[8] Renal calculi, renal tumors, tuberculosis of the urinary tract, suppurative processes in or about the kidney, or tumors that press upon and obstruct the urinary passages can cause pus in the urine.

Dyes, foods, drugs, alcoholic drinks, chemicals, heavy metals and substances that cause irritation when they reach the urinary tract, can be followed by pus in the urine. Allergy may play some part in these reactions or may be a primary cause in some cases.

In clinical pediatrics one is impressed with the frequency of pyelitis occurring in girls who have or have recently recovered from upper respiratory infections. The pus in the urine may be found for a few days or longer. Tonsillitis, sinus disease, mastoiditis, and the acute exanthemata are frequently accompanied or followed by urinary findings.[9] Dental caries may also produce pyelitis.[10] Occasionally, one sees a patient whose urine was negative before tonsillectomy flare-up, with a transient pyuria afterward without other demonstrable urinary disease. Such findings have suggested to some that possibly focal infections play an important part in the production of pyuria. The pyelitis may represent a toxic reaction, an allergic reaction, or possibly a reaction to a filterable virus.[11]

There are many cases of pyelitis where no causative factor can be found. Pus may appear in the urine without any other clinical evidence of disease and disappear as it came.

[11] Cook, Edw. N.: Urinary Infections, M. Clin. North America, 21:797 (May), 1937.

Whatever the anatomical or focal cause for pyelitis may be, the active agents in most cases where inflammation of the urinary tract is present are bacteria. There are three possible routes for bacteria to gain access to the urinary tract: (*a*) by ascending from the urethra, (*b*) by the blood stream, and (*c*) by the anastomosing lymphatics. It has been held that the cocci, with the exception of the streptococcus fecalis,[12] probably reach the urinary tract by way of the blood stream. The bacilli generally represent the ascending infection from the urethra and thus explain the greater frequency of this type of infection in the female. Whichever organism is found may not be the causative agent, according to some reports, but only a secondary invader. Bacillary infections are by far the more common, being found alone or in combination in 60 to 80 per cent of cases.[2] Hellstrom,[13] in his series, had an almost equal number of males and females with coccal infections, and in the same series for bacillary infections there were 13 males and 120 females. Helmholz,[12] in children under fifteen years of age, had an equal number of boys and girls with coccal infections, while with bacillary infections 85 per cent of the infants were girls, and in older children 75 per cent were girls. It may be a point for argument that since coccal infections are equal in the two sexes and bacillary infections more prevalent in girls that the route of invasion of the two organisms is different.

The more common types of organisms found in pyelitis are Escherichia coli, Aërobacter aërogenes, Proteus ammoniæ, Pseudomonas, Salmonella, Alcaligenes, typhoid, Shigella, Streptococcus fecalis, Streptococcus (green-producing), Streptococcus hemolyticus, Staphylococcus, gonorrhoeae, and tuberculosis.

II. DIAGNOSIS

William E. Stevens, M.D. (490 Post Street, San Francisco).—In the presence of fever of unknown origin during infancy and childhood, pyelitis (pyelonephritis) should always be suspected and a catheterized specimen of urine be carefully examined. Pus in an acid urine is due to pyelitis in the majority of these patients. In female infants and children it is the most common pathological condition of the urinary tract. Cultures are imperative. They will usually reveal colon bacilli, although cocci are not uncommon. If pus, blood or bacteria are found in the catheterized specimen of urine, a thorough urologic examination is demanded in order to determine its source since, during infancy, pyuria or hematuria is often the only symptom pointing to the genito-urinary tract. The importance of early diagnosis of kidney infections cannot be overemphasized because, if allowed to become chronic, many of these conditions are difficult and, at times, impossible to cure. Pyelitis may persist indefinitely, however, with few, if any, symptoms. Other cases progress more rapidly and, if untreated, result in destruction of the kidney. During infancy it is a self-limited disease in 50 per cent of cases. Some abnormality of the urinary tract will be found in about one-third of the remainder. I believe that pyelitis occurring during pregnancy is occasionally an exacerbation of a low-grade infection that has persisted since infancy.

Pyelitis occurred in almost one-third of our series, 74 of 205 cases, with urinary-tract pathology, and was found about four and one-half times as often in females as in males. This corresponds to the majority of the statistics reported in the literature. Pus, pus casts, and a few red blood cells are usually found in the urine, while chills, fever, frequent urination, dysuria, gastro-intestinal disturbances and prostration are the most common subjective symptoms of this condition. In children over two years of age, tenderness in the kidney region is often detected on palpation.

Pyelitis is to be differentiated from such conditions as acute intestinal infections, acute glomerulonephritis, tuberculosis of the kidney and calculi. The continuation of fever after the intestinal intoxication is relieved, and the positive urinary findings, suggest pyelitis. The polynuclear leukocytosis is lower than in appendicitis. Phenolsulphonephthalein output is decreased in severe renal infection. As in the adult, negative cultures in the presence of pus are suggestive of tuberculosis. In glomerulonephritis casts, more albumen, a larger number of blood cells and fewer pus cells will be found in the urine. Most calculi will be detected by roentgenography. This procedure will also often reveal some irregularity and dilatation of the kidney pelvis and calices in chronic pyelitis.

The determination of the presence or absence of stasis is of great importance. Functional kidney tests, urethral and ureteral calibration and pyeloureterography are indicated when this is suspected as well as in those cases that do not improve in ten days or two weeks under conservative treatment. The frequency of anomalies of the urinary tract as primary or contributory factors is of importance from the standpoint of diagnosis as well as of treatment of pyelitis during infancy and childhood.

It is only within a comparatively recent period that the value and practicability of modern diagnostic urologic procedures during infancy and childhood have been appreciated. It is now possible to procure satisfactory cystoscopes of such small size that age is no longer a contraindication to cystoscopy, cystography, catheterization of the ureters, chromo-ureteroscopy, comparative functional kidney tests or retrograde pyelography. There is, as a rule, comparatively little reaction following instrumentation in infants and children. Gentleness is, of course, essential. The fact that in these patients the bladder and, consequently, the ureteral orifices are at a higher level in the pelvis, should be remembered. The intravenous or intramuscular injection of indigocarmin will be helpful when visualization of the ureteral orifice is difficult because of injection of the bladder mucosa or for other reasons.

It is usually necessary to employ general anesthesia in children under ten, although I have occasionally been able to cystoscope and catheterize the ureters of patients as young as six years of age following the application of a 5 per cent cocain solution to the urethra on a cotton-tipped applicator. Corbus advises the hypodermatic injection of one-ninth to one-third of a grain of pantopon, one-half hour before cystoscopy, and the application or injection of a 0.5 per cent cocain and sodium bicarbonate solution to the urethra. The administration of fluids prior to cystoscopy is important.

A smaller quantity of urine is excreted by children's kidneys during general anesthesia, and a temporary reflex anuria has not been uncommon in my experience. Haines and Milliken have recently shown that ether anesthesia inhibits kidney function, both the quantity of urine and the elimination of dyes being decreased. They believe this to be due to constriction of the renal vessels. The preliminary injection of morphin and atropin, however, partly prevents the constriction, and to a certain extent the decrease in kidney function. There is apparently somewhat less interference with renal function during the administration of nitrous oxid and oxygen. Spasmodic contractions of the bladder occasionally interfere with rapid catheterization of the ureters in infants if anesthesia is not complete. In addition to temporary inhibition of function, the small size of the catheters, necessarily used in some of these patients, is often a contributing factor to the occasional difficulty of performing satisfactory functional kidney tests and of obtaining a sufficient quantity of urine for proper examination. These facts should be taken into consideration when ureteral catheterization and functional kidney tests under general anesthesia are contemplated.

III. TREATMENT

E. **Earl Moody**, M. D. (829 South Alvarado Street, Los Angeles).—In a great majority of cases the treatment of pyuria in infants and children is a most satisfactory procedure. Early satisfactory results with simple methods are usual. However, some cases are intractable to treatment and try the patience of the physician, and the long duration of symptoms is discouraging to the parents and the patient as well. It is these cases that do not respond well which demand of the physician a thorough knowledge of the pathology present and the type of bacteria causing the infection, as well as a familiarity with the therapeutic measures available.

Children suffering with pyuria are usually acutely ill with severe toxemia and high temperature. They should be treated like other acutely ill children. Absolute bed rest is essential. The environment should be pleasant, with ample light and air. Chilling should be avoided. Nursing care should be efficient.

As with any acute infection, we feel that an adequate intake of fluids is the first thought of the physician. The child must be assured of 150 to 200 cubic centimeters of fluid per kilogram of body weight, each twenty-four hours during the acute stage. This will prevent and cure dehydration. It will dilute toxins, and will flush the kidneys and urinary tract of bacteria with their toxins. This procedure alone often lessens symptoms to a marked degree. Most children will take enough fluid by mouth without resorting to other means of administration. Plain water is very acceptable. Fruit juices will be well tolerated and enjoyed, and are valuable in shifting the urine toward the alkaline side. Skim milk, buttermilk, or lactic-acid milk will supply food as well as increase the total fluid intake. To sweeten the fruit juices and water with karo, honey, or sugar will often increase the desire of the child to take fluids, and will, at the same time, furnish a high carbohydrate intake, thereby supplying food as well as preventing and curing an acidosis. It must be remembered, however, that some children object to the constant sweet intake, and one will get faster results if he will restrict himself at these times to plain water for a few hours. We feel that any treatment which demands withholding of fluids in these acutely ill children has no place in pediatric practice. Most of these cases will be treated in the home. It is imperative that the physician definitely outline to the parents the minimum amount of fluid required for each twenty-four hours, and that the amount should be accurately measured.

If the child does not take kindly to an adequate intake of fluids, giving 5 to 10 cubic centimeters with the medicine dropper every few minutes will often prove a successful method of administration, especially with the small infant. If this does not allow the minimum intake, then other methods of administration must be followed. Fluids can be administered by gavage, subcutaneously, intraperitoneally or intravenously. Acutely ill, dehydrated, small infants may not absorb subcutaneous fluids well and severe edema may result temporarily. This is no distinct disadvantage except that it is an indication the fluid given is not being utilized, and other methods of administration must be followed. Except in a badly distended abdomen, the intraperitoneal route offers a method of administration that is simpler than the intravenous, and for this infection is equally as effective and as safe. Large amounts of normal saline can be given by this method without discomfort or harm. Excessive intra-abdominal pressure is to be avoided. There is no objection to any of these extra-oral methods of fluid administration, but they are uncomfortable or painful to the patient. Patience and perseverance on the part of the nurse, in mouth administration, often will save this discomfort. In administering this life-saving and curative fluid, however, the rest of the patient must not be neglected, and ofttimes more rapid methods, which will allow greater rest, hasten recovery.

The judicious use of alkalies in the treatment of pyuria has won for itself a well-deserved place in our therapeutic attack. Even though it has been shown experimentally that the P^H of the urine must be as high as 9.2 before it can affect the bacteria present, and that, with large doses of alkalies, a P^H beyond 8.4 is never reached, yet, from practical experience we know that the use of large amounts of fluids with alkalies takes care of the great majority of cases in a few days. With some physicians this is the method of first choice. One should give the equivalent of seven and one-half grains each of sodium bicarbonate and sodium citrate four times daily to small children, and double this amount to older ones. The action of the alkalies is not definitely understood. It has been suggested that the good results are due to the diuretic action, the direct effect upon the tissues or even a bacteriophage reaction. But the method works in a high percentage of cases and is the simplest of all procedures, and should, in our opinion, be the first method of attack.

The acidification of the urine has long been a standard method of treatment. Sodium acid phosphate and benzoic acid are not now commonly used and have been replaced by such salts as ammonium chlorid, ammonium nitrate, calcium chlorid and sodium and ammonium mandelate. These salts, in adequate dosage, lower the P^H of the urine to the level of 5.5 to 4.8, where bacterial growth is inhibited. This degree of acidity must be tested by some indicator, and sufficient drug used to keep the P^H below 5.5. If a strip of chlorophenol red paper remains yellow when dipped in the urine, this state has been reached. Such a condition is brought about by giving 0.5 gram of the acid salts every four hours to the smaller children, and larger doses to older children. If pus, bacteria, and febrile symptoms do not disappear in a few days, the addition of methamin may be tried. Less of this drug will be required if the urine is held in a highly acid state. An infant should receive 0.2 gram four to six times daily. In hospital practice, culture of the urine should determine whether the treatment has rendered the urine free of bacteria. In bedside practice it is practical to continue the treatment a few days after all symptoms have subsided and the urine is microscopically free of all pus cells. Such a procedure usually guarantees that there will be no return of the symptoms.

If results are not rapidly obtained with either of the above methods, brilliant results are sometimes secured when the urine is rapidly changed from a strongly alkaline to a strongly acid reaction. This process can be repeated several times in succession. It has stood the test of time because of the results obtained.

It has been interesting to observe the evolution of the process of acidification of the urine. We are indebted to Dr. Henry Helmholz of the Mayo Foundation for much of our knowledge in this respect. After the limitations of the use of the acid salts with methamin were demonstrated in certain cases, the ketogenic diet was used to insure the P^H as being sufficiently low to be bactericidal to organisms. The use of this procedure is very limited. It can be followed out only under rigid control, and then used only in the older children in the chronic stage of infection. It is utterly impossible to use such a procedure in the acutely ill patient. Acidosis would be increased, which would produce severe vomiting, thus further increasing dehydration, which often is seen in these cases. With appetite already markedly reduced in these acutely ill patients, it is next to impossible to get them to take such a diet. Theoretically, it is possible. Practically, it has no place in "bedside medicine."

In the past few years the use of Mandelic acid has been common. This is given in the form of the sodium or ammonium salt, and is excreted unchanged in the urine. It is usually dispensed in the form of a 40 per cent syrup of the ammonium salt.

When the acid salts are given, occasionally nausea and vomiting result, and even blood may appear in the urine. The value, we feel, lies not in the acute condition, but in the more chronic state where the individual has developed some immunity to his infection and is not overwhelmed with acute toxemia. We have seen many acutely ill children made more so by such treatment instituted early in the course of the disease.

It seems that sulphanilamid will also have its day in the treatment of urinary infections. It has been shown to be very effective in all bacterial infections of the urinary tract, except that due to Streptococcus fecalis. It is effective in low concentration and works best in an alkaline urine. It can be given in the acute stage together with the usual forced intake of fluids and urinary alkalinization. Even in cases of reduced renal function it is valuable. The drug is eliminated through the kidney, and because the concentration needed in the urine is not high, sufficient quantity of the drug will be excreted by the damaged kidney to render the urine bactericidal. Experimental work has shown that a concentration as high as 100 milligrams per cent can be maintained by such small doses as 25 grains per day. Such concentration, it seems, is not necessary for successful treatment of urinary infection. Some feel that, for the usual infections, a concentration as low as 15 milligrams per cent is effective. As added experience is gained, the relationship of dosage to urinary reaction will be effectively worked out. Already we know that the dosage need not be large in urinary infections. Such daily dosage as five to seven grains for infants, seven to fifteen grains for children of from two to three years, and the upper limit of thirty grains for the older children, is effective. It is possible that, when our knowledge is complete, this method of treatment of urinary infection will supplant all others. Until that time the physician must choose from the rather wide armamentarium that procedure which seems to fit the individual case best.

The diagnosis of pyelitis is not complete as long as abnormalities of the urinary tract are not excluded. The occurrence of such abnormalities are not high in proportion to the total number of cases of pyuria seen. The great majority of the cases will respond to one of the methods of treatment outlined above in a relatively short time. A certain few will not. Then it must be determined by urological methods whether an abnormality does exist, for all of the above treatment will be of no permanent benefit until such abnormalities are corrected. We feel that any pyuria that does not clear in a period of four to six weeks should have the benefit of urological consultation. We would take strong issue with some of our urological consultants who feel that all cases of pyuria should be instrumentated early, and this during the acute stage of the disease. It is pathetic to see the severe reactions that sometimes result from such procedures. Our results are so gratifying in a few short days, by simple treatment in such a high percentage of cases, it would seem that common sense would dictate the use of the simplest procedures first. Certainly, no great harm can come in the average case because of a delay of a few weeks in correcting an abnormality which has existed throughout life. The physician, however, should never allow himself to be found guilty of neglecting to have urological consultation if the means at his disposal do not bring results in a few short weeks. Pyuria appearing in the very young infant, however, demands earlier investigation than the ordinary cases, for here abnormalities somewhere in the urinary tract are much more apt to be the etiological factor.

It would seem self-evident that if a known focus of infection were the etiological factor in the pyuric condition, such focus should be removed when the state of the child warrants such a procedure.

Summary.—A rational summary of our armamentarium in the treatment of pyuria in infants and children would be as follows:

1. Bed rest under proper environment.
2. Adequate intake of fluids, with alkalinization of the urine as the first step.
3. The acidification of the urine by the method most suitable to the case in hand.
4. The use of sulphanilamid under proper control. Perhaps this procedure will eventually take first place in our attack.
5. Urological consultation for the case that does not respond well to these measures.
6. The removal of foci of infection.

Drug Treatment in Coronary Disease.—Drugs have practically no value as a specific treatment for coronary disease if the patient is free of symptoms, Harry Gold, M.D., New York, declares in *The Journal of the American Medical Association* for January 7. The one exception is syphilis involving the blood vessels of the heart.

At the present time there are no drugs that definitely influence the course of disease of the muscles and blood vessels of the heart. However, when pain exists certain drugs are beneficial.

The nitrites are the preferred drugs in the treatment of effort angina (pain on effort). The nitrites do not impair awareness of pain but abolish the mechanism that causes it.

The nitrites are not entirely free of disagreeable effects. They may bring about such minor symptoms as flushing of the face, headache, a sensation of throbbing and tension in the head, palpitation and, in excessive doses, collapse. Sometimes these symptoms can be averted by reducing the dose without losing the effect of the drug.

The dose should be taken at the first suggestion of the oncoming pain. Some patients, guided by a mistaken notion that danger of injury or the development of habit is involved in frequent use of the nitrites, wait for the full development of pain.

The frequent use of the nitrites will neither lead to dependence on them nor reduce their efficacy.

Of the numerous other drugs used in heart disease, the xanthin compounds exert no action that is useful for the routine treatment of heart pain.

The purin bases are extremely valuable in promoting the secretion of urine in congestive heart failure.

In a typical case of coronary thrombosis in which there is agonizing pain, anguish and terror of impending death, morphin is the preferred drug. It not only relieves pain but also abolishes the desire to move about and in many instances gives rise to a sense of well-being which is quite apart from its analgesic effects.

By reducing nervous excitability the barbiturates decrease the number and severity of the attacks of effort angina. By means of the barbiturates fear, anxiety and restlessness in acute coronary thrombosis may be controlled.

Digitalis is useful in heart failure and in certain disorders of heart rhythm.

The indications for drugs promoting the secretion of urine include in part those for digitalis. These drugs are useful for the control of congestive heart failure and attacks of recurrent labored breathing.

While in many instances great suffering is spared and a life is saved through the judicious use of these many drugs, the major part in the control of this disease lies not in drugs but in expert guidance in making the mental and physical adjustments which will enable these patients to carry on within their capacity without symptoms of heart disease.

Almost Any of Mankind's Diseases May Be Cause of Failing Vision.—Failing vision may be due not alone to the eyes themselves but to any one of the many diseases of mankind, Samuel I. Kaufman, M.D., Chicago, declares in the February issue of *Hygeia*.

Although most cases of failing vision result from faulty shape of the eyeball and can be corrected only by glasses, those cases due to disease must be given medical or surgical treatment. The eye physician, therefore, must be properly trained in the relationships between the eye and the rest of the body, as well as in the structure and function of the eye itself.

"Any one of the many diseases that afflict the human body as a whole may cause failing vision," Doctor Kaufman says. For example, the retina may be affected by Bright's disease, diabetes, syphilis, high blood pressure or arteriosclerosis.

"Abnormal changes of the retina may take the form of hemorrhage, swelling, scarring, degeneration, atrophy or even detachment of the retina itself from its underlying structures," he points out.

Brain tumors, syphilis, sinus infections and chronic poisoning from lead, wood, alcohol or tobacco are among the diseases which may damage the optic nerves.

Glaucoma or hardening of the eyeballs, a frequent cause of blindness, gives no warning of its presence. The best chance for a cure of this disease lies in its early recognition and prompt treatment.

Double vision, caused by paralysis of the ocular muscles, is generally "a manifestation of some deeply seated disease and calls for the most painstaking investigation to determine its exact nature."

"By far the most frequent cause of this disturbance is advanced syphilis," says Doctor Kaufman. "Other less frequent causes are multiple sclerosis, brain or orbital tumors, inflammation of the nasal sinuses, ear infections, diphtheria, diabetes, poisons and injuries."

If no disease is present and glasses are prescribed, the patient should heed the physician's advice to have the glasses made at a reputable optical house.

"No matter how accurately the prescription for glasses is arrived at, it frequently fails to give the best results in improved vision and comfort because of defective materials and workmanship used in making the glasses," the author warns.

The calamity of blindness is now rare, Doctor Kaufman says, "largely because of the untiring efforts of some courageous workers in convincing reluctant legislators to enact the so-called 'Silver Nitrate Law,' which effectively prevents eye infections in the new-born.

"Similarly, cases of blindness resulting from industrial eye injuries, which were once so frequent, have now been largely brought under control in the larger industrial plants through adoption of various safety measures.

"It is within the range of possibilities that a pure food and drug act may yet effectively protect the public against dangerous poisons injurious to sight, which are contained in various commercial preparations advertised for such things as reducing weight, removing superfluous hair and dyeing hair."

CALIFORNIA PHYSICIANS' SERVICE*

The letter which appears below gives information that should be of interest to all who have been interested in the development of the medical service plans of the California Medical Association. Every California Medical Association member should take the time to read it and to govern himself accordingly.

(Copy)

San Francisco, February 14, 1939.

To Administrative Members,
California Physicians' Service.

Gentlemen:

The trustees have held two day-long meetings in San Francisco. The Articles of Incorporation were filed with the Secretary of State on February 2, 1939, and the trustees elected the following officers on February 4, 1939: President, Ray Lyman Wilbur; vice-president, Lowell S. Goin; vice-president, C. Kelly Canelo; secretary, Alson R. Kilgore; assistant secretary, T. Henshaw Kelly; treasurer, Alson R. Kilgore; assistant treasurer, T. Henshaw Kelly.

They appointed Morton R. Gibbons, Sr., as medical director, and A. W. Widenham of San Francisco as general manager.

There is no need to describe Doctor Gibbons. Mr. Widenham was selected after careful investigation of the available applicants and some who were not applicants. He has worked with Doctor Wilbur, who testifies to his ability. For many years he was the secretary and manager of the Musical Association of San Francisco, which is the parent and operator of the San Francisco Symphony Orchestra. His business was to run subscribers, musicians and to do the main job of raising money every year. This work has given him a wide acquaintanceship and he has a most effective personality.

The trustees, according to the by-laws, appointed an executive committee consisting of T. Henshaw Kelly, Samuel Ayres, Jr., and Alson R. Kilgore. This committee is preparing, with the assistance of Mr. Peart, an abstract of the by-laws and authorized a series of questions and answers which were prepared by Doctors Goin and Ayres, and which deal with all of the aspects of the plan and its operation.

A committee is working on the proper districting of the state and another has the duty of establishing a fee schedule to be used in the unit system of compensating the professional members.

Doctors Kelly and Kilgore have been looking for offices for the Service and it would seem the sensible thing to establish it in the Mills Building, Bush and Montgomery streets, in San Francisco. This is a good building in the business district and the rents are quite reasonable compared to those in some of the other buildings.

The trustees propose to send to every licensed doctor of medicine an explanatory statement, the abstract of the by-laws, the rules and regulations and the questions and answers referred to above, and to include with this booklet an application for professional membership, and a letter urging each man to apply immediately. They propose to have a group in each county society or district ready to make contact with all of the men as soon as this material is mailed in order that each physician may be personally urged to join in the plan.

The trustees would like each councilor to suggest to them one or two men in his district who would be more or less representative of the physicians in that district, and with whom the committee might discuss the matter of the fee schedule and if there are societies with fee schedules in the district, to obtain copies of them for the committee's information.

The committee proposes shortly to call a meeting of men from the various districts and from various groups of practitioners to advise as to the fee schedule which will then soon be promulgated.

The office of the Service will be opened on February 15, as that is the day that Mr. Widenham, the general manager, is to take up his duties.

Shortly, the application blanks for professional membership will go out (as soon as they and the booklet can be printed and the envelopes addressed) and the organization of the professional membership will be in train.

It is important that the plan be functioning at the earliest moment and the trustees are doing everything they can to speed the day.

Sincerely,

EXECUTIVE COMMITTEE OF
CALIFORNIA PHYSICIANS' SERVICE
T. Henshaw Kelly, *Chairman*
Alson R. Kilgore
Samuel Ayres, Jr.

POSTGRADUATE CONFERENCES

Local Committees on Postgraduate Activities are at work on details concerning prospective courses in their respective districts. *Tentative* dates for courses soon to be announced include:

Santa Barbara District.

March 18 and 19, 1939. For information, address H. E. Henderson, M. D., 1421 State Street, Santa Barbara.

San Bernardino District.

April 4, 1939. For information, address F. E. Clough, M. D., 491 Fifth Street, San Bernardino.

San Mateo District.

Dates to be announced. J. Garwood Bridgman, Secretary.

---

EXECUTIVE COMMITTEE

Abstract of Mail Vote Taken on February 3, 1939

Chairman Kelly authorized a mail vote on expenditure of sum not to exceed $1,200 for insertion of a greeting announcement in the special editions of Bay Region newspapers, incident to the opening of Golden Gate International Exposition, as an expression of appreciation of past coöperation. A majority voted in favor of the expenditure.

MID-YEAR CONFERENCE OF CALIFORNIA MEDICAL ASSOCIATION OFFICERS AND COMMITTEES AND COUNTY SOCIETY SECRETARIES

The Third Annual Joint Conference of California Medical Association Councilors, California Medical Association Committeemen, and County Society Secretaries was held in the Franciscan Rooms, Sir Francis Drake Hotel, San Francisco, on Saturday, February 25, 1939. The sessions of the different groups began at 9:30 a. m., and adjournment took place shortly before six o'clock. In this issue of the Official Journal, it is possible to give only the outline of the proceedings, as follows:

PROGRAM

President W. W. Roblee, Riverside, Presiding

9:30 a. m.—Association Secretary's Announcements.

* * *

Part I—Conferences

9:30-10:30 a. m.—County Secretaries' Round Table: Robert Peers, Colfax, presiding.

(Consideration of queries sent in by secretaries on their reply blanks, and of questions submitted at this Round Table Conference.)

9:30-10:30 a. m.—Reunion of Standing Committee Groups.

(Members of each committee are requested to confer with one another concerning their work, and chairman or other member to submit the committee's report at the afternoon session.)

9:30-10:00 a. m.—Council—Council Meeting, Chairman Karl Schaupp, presiding.

(Meeting will be held in usual place, Room 209, on the second floor. Councilors are requested to go to the room promptly to consider certain docket items concerning which action at this time is desirable.)

* * *

Part II—Symposium on Medical Service Activities

10:30-12 or 12:30 noon—(Ten to fifteen-minute talks, followed by Question Box period.)

Introductory Remarks.—President W. W. Roblee.

Health Service Backgrounds.—Ray Lyman Wilbur, Chairman, Board of Trustees, California Physicians' Service.

Work of the Special Committee on Medical Service Plans: In Retrospect.—President-Elect Charles A. Dukes.

California Physicians' Service: Program to Date.—T. Henshaw Kelly, Chairman, California Physicians' Service Executive Committee.

Plans of California Physicians' Service.—Morton R. Gibbons, Medical Director, California Physicians' Service.

Health Service Bills before California Legislature Now in Session.—Junius B. Harris, Chairman, California Medical Association Committee on Public Policy and Legislation.

Question Box Period.

(An informal discussion and exchange of views. Questions sent in on the reply blanks will be taken up. Other queries from the floor.)

* * *

Part III—Luncheon Recess

12:30-2:00 p. m.—(Delegates will be the guests of the California Medical Association. Luncheon will be served in the mezzanine balcony. Members of committees are requested to take places at the same tables.)

1:30 p.m.—Meeting of Administrative Members of the California Physicians' Service. (Place of meeting will be announced by Doctor Kilgore.)

Part IV—Special Reports

2:00 p m.—(Ten-Minute Progress Reports.)

Concerning Proposed Laws, Now Before the California Legislature.—Junius B. Harris, Chairman, Committee on Public Policy and Legislation.

California State Board of Public Health: Pending Legislation.—Howard Morrow, President of the Board of Public Health.

California State Board of Medical Examiners: Pending Legislation.—William R. Molony, Sr., President of the Board.

Del Monte Annual Session: May 1-4, 1939.—J. Homer Woolsey, Member, Committee on Scientific Work.

Department of Public Relations.—George G. Reinle, Chairman.

Cancer Commission.—Otto H. Pflueger, Secretary.

* * *

Part V—Reports of Standing and Special Committees

(Five-Minute Progress Reports)

Standing Committees

Associated Societies and Technical Groups—John V. Barrow, Chairman.

Health and Public Instruction—Fred B. Clarke, Chairman.

History and Obituaries—Frank R. Makinson, Chairman.

Hospitals, Dispensaries, and Clinics—W. Earl Mitchell, Chairman.

Industrial Practice—Philip Stephens, Chairman.

Medical Defense—George G. Reinle, Chairman.

Medical Economics—John H. Graves, Chairman.

Medical Education and Medical Institutions—Loren R. Chandler, Chairman.

Membership and Organization—George D. Maner, Chairman.

Postgraduate Activities—John C. Ruddock, Chairman.

Publications—Ralph Eusden, Chairman.

Special Committees

Subcommittee on Pneumonia Control—Roy Thomas, Chairman.

Report of Special Committee on Cancer Exhibit at Golden Gate International Exposition—T. Henshaw Kelly, Chairman.

Report of Committee on County Hospitals—Louis Packard, Chairman.

Report of Committee on Farm Bureau Conferences—Henry S. Rogers, Chairman.

Report of Committee on Animal Experimentation—Philip K. Gilman, Chairman.

Report of Committee on Venereal Diseases—Howard Morrow, Chairman.

Report of Committee on Basic Science Law—George H. Kress, Chairman.

* * *

Part VI—Question-Box Hour: "The Good of the Order"

If time permits, and until adjournment hour is reached, the remainder of the session will be given over to questions on matters pertinent to "The Good of the Order." (May be state, county, local, or other nature.)

SENATE BILL NO. 1128*

An act to amend the title and Section 3 of, and to add Articles 11 to 16, inclusive, comprising Sections 151 to 358, inclusive, to the Unemployment Reserves Act, relating to a system of health insurance within the system of unemployment reserves.

The people of the State of California do enact as follows:

Section 1. The title of the Act cited in the title hereof is hereby amended to read as follows: . . .

Article 11. Health Insurance, Generally

Sec. 151. The provision of Articles 11 to 16 of this Act establish and provide for a plan of compulsory health insurance integrated with the system of unemployment insurance, together with plans of voluntary health insurance for which provision is made herein. . . .

Article 15. Organization of Medical Services

Sec. 300. All licensed physicians and surgeons may register under the Health Insurance Code for the purpose of entering into contracts with the State as independent contractors for rendering medical services to service beneficiaries and their dependents.

---

* For editorial comment, see page 170.

Sec. 301. A service beneficiary may select any licensed physician and surgeon registered under this code for the purposes of securing general practitioner services for himself and his dependents. Every licensed physician and surgeon registered under this code is entitled to reject any service beneficiary and his dependents.

Sec. 302. Every registered physician and surgeon upon accepting a service beneficiary shall, until a change is made by him, or by the service beneficiary, be charged with the supervision of the health of the service beneficiary and his dependents and shall be obliged to render general practitioner services if and when such services are needed by the servic beneficiary and his dependents.

Sec. 303. Service beneficiaries failing to exercise their right to choose a licensed physician and surgeon registered under this code shall be assigned a registered physician and surgeon who has indicated himself as desirous of additional service beneficiaries for his list. At all times a service beneficiary shall be on the medical list of a licensed physician and surgeon registered under this code.

Sec. 304. A licensed physician and surgeon registered under this code shall receive remuneration to be determined by the number of service beneficiaries upon his medical list. The maximum number of service beneficiaries shall be determined by the governing authority after consultation with the advisory council.

Sec. 305. X-ray and laboratory services shall be performed by public laboratories and approved private laboratories which have contracted to render services at stipulated rates comparable to the costs of efficiently operated public laboratories.

Specialist and consultant services shall be rendered in public diagnostic centers which diagnostic centers shall be organized in various places throughout the State as adjuncts to selected public hospitals in the area. Specialist and consultant services may also be rendered in approved private diagnostic centers which are adjuncts to selected public hospitals or which are adjuncts to approved private hospitals rendering hospitalization services under this code. Approved private diagnostic centers and approved private hospitals shall be compensated in accordance with contracts prescribing the compensation at stipulated rates comparable to costs of efficiently operated public diagnostic centers and public hospitals.

Emergency specialist and consultant services shall be provided in accordance with the rules and regulations established by the medical director.

Sec. 306. Remuneration for all services not otherwise provided for in this code shall be fixed by the governing authority after consultation with the advisory council.

Sec. 307. Drugs and medicaments may be purchased from any pharmacy which has agreed to sell them at prices fixed by the governing authority.

Sec. 308. Service beneficiaries, notwithstanding the provisions of the foregoing sections, may choose any group unit of licensed physicians and surgeons who have associated themselves into a unit registered under this code for the purpose of providing medical services in accordance with the standards established pursuant to the code.

A registered group unit of licensed physicians and surgeons shall receive compensation under the supervision of the Medical Director upon the basis of a fixed amount per annum for the number of service beneficiaries upon its list, the amount of which to be dependent upon the scope of the medical services rendered to service beneficiaries by the group unit.

Article 16. Administration

Sec. 350. There is established in the Department of Employment a Bureau of Medical Service.

Sec. 351. The unemployment compensation benefit service of the Department of Employment shall collect, account for, prepare the records, and do the disbursing for the Bureau of Medical Service.

Sec. 352. The administration of the Bureau of Medical Service shall be vested in a director to be known as the Medical Director, who shall be appointed under the civil service by the governing authority of the department.

The Medical Director shall be assisted by an advisory council appointed by the Governor, which advisory council shall in all cases comprise three representatives of labor selected from panels presented by bona fide state-wide labor organizations in the State, and two representatives of employers selected from panels presented by bona fide employer organizations of the State.

When serving as an advisory council to the Bureau of Medical Service, there shall be added to the council a representative of the medical schools selected from a panel presented by the bona fide medical schools in the State, and a licensed physician and surgeon selected from a panel presented by the licensed physicians and surgeons registered under the code.

Sec. 353. The Medical Director appointed under civil service shall be a licensed physician and surgeon who has had at least ten years in the active practice of medicine.

Sec. 354. The State shall be divided into medical service districts, each of which shall be in charge of a district medical supervisor selected in accordance with the State Civil Service Act. The district medical supervisors shall be licensed physicians and surgeons who have had at least five years in the active practice of medicine.

Sec. 355. In each district there shall be established a panel committee selected by the licensed physicians and surgeons registered under the code, which committee shall serve in an advisory capacity to the district medical supervisors. The panel committees in each district shall, by post-card ballot, select the panel from which the Governor shall select a representative to represent the licensed physicians and surgeons registered under this code upon the advisory council.

In addition, in each medical service district, panel committees shall be established, consisting of representatives of professional groups engaged in rendering medical service benefits under the provisions of the Health Insurance Code, and they shall likewise be entitled to select the panel by post-card ballot election, from which the Governor may appoint a representative upon the advisory council.

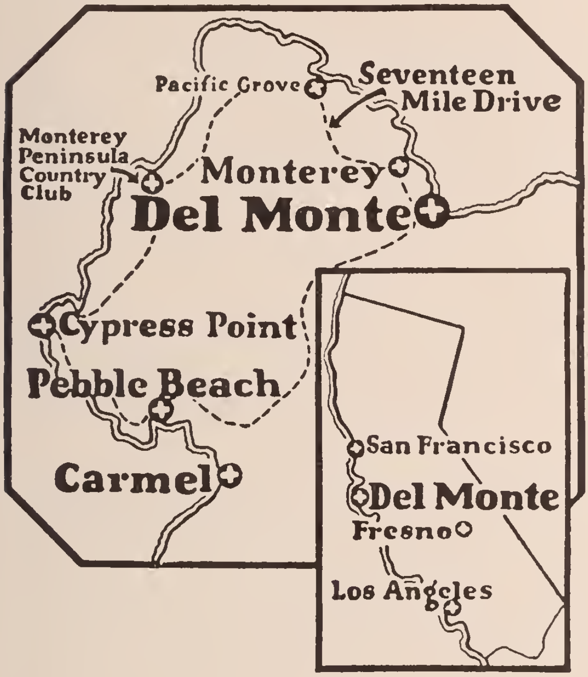
Sec. 356. The Medical Director may establish a Bureau of Accounting and Efficiency for the purpose of making cost analyses and determining the most efficient method of organizing and administering the system of medical services established under this code.

Sec. 357. The governing authority after consultation with the Medical Director and the advisory council shall prepare rules and regulations governing the administration of disability unemployment benefits and medical benefits.

Sec. 358. The Medical Director after consultation with the advisory council shall prepare rules and regulations governing disciplinary action to be taken in regard to all individuals and their dependents insured under the provisions of this code, licensed physicians and surgeons registered under this code, and any other person or group of persons rendering services under this code who are guilty of violating their obligations in respect to disability, unemployment benefits and medical benefits.

Rules and regulations governing disciplinary action against any individual against whom disciplinary action may be taken under this section shall in all cases make provision for both a hearing and consultation with the proper panel committee before any recommendation may be made by a district medical officer and shall permit actual deprivation of privileges only by the Medical Director and only after consultation with the advisory council and an appellate body, one member of which shall be a member of the professional or technical group to which the person accused belongs, has conducted a review relative to the district recommendation.

HOTEL AND AUTOMOBILE COURT RATES FOR DEL MONTE ANNUAL SESSION



Hotel rates of the hotels at Del Monte and on the Monterey Peninsula were given in the February issue, on pages 137 and 138.

Additional information concerning location of automobile courts appears below.

With the large attendance in prospect for the May 1–4, 1939, annual session meetings at Del Monte, hotel reservations in advance are advised.

Seventeen-Mile Drive Auto Court

The Seventeen-Mile Drive Cottage Court is located at the entrance to the Seventeen-Mile Drive, and rates are $1 and up per day. Fred W. Workman, Manager, Corner Sinex Street and Seventeen-Mile Drive, Pacific Grove, California. P. O. Box, 529. Telephone, Monterey, 6552.

* * *

Mikel's Cottages

Mikel's Cottages are located in Pacific Grove, and the rates run $2 single, $2.50 double, and up. Mikel's Cottages are de luxe, quiet and homelike, located in the pines. N. Mikel, Owner, 1073 Lighthouse Avenue, Pacific Grove, California. Telephone, 8860.

* * *

Pine Oak Auto Court

The Pine Oak Auto Court is located one-half mile east of Del Monte, and has cottages from $1 up; their accommodations all have nice beds and practically all are equipped with showers. D. C. Cooper, Manager, 2149 Fremont Street, East Monterey, California. Telephone, Monterey 5288.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS[†][*]

CALIFORNIA LEGISLATURE—FIFTY-THIRD SESSION

List of proposed statutes having a relationship to medical practice and public health activities, submitted in the month of January, 1939, is given below. February, by law, is a constitutional recess, and the Legislature is not in session. The final session opens on March 6.

Members of the California Medical Association may well glance over the list which follows.

The letters "A. B." mean Assembly Bill. The names of the Assemblyman or Assemblymen who introduced the bill are also given. The letters "S. B." mean Senate Bill.

Members who desire copies of certain bills may write to the California State Printer, Sacramento; or to Joseph A. Beck, Secretary of the California Senate, Sacramento; or to J. C. Greenburg, Clerk, California Assembly, Sacramento, giving always the number of the bill desired and stating whether it is an Assembly or Senate bill.

Board of Health
(Nine Bills)

A. B. 1215, by Rosenthal, by request (referred to Committee on Public Health and Quarantine). Places Director of Public Health in charge of Department and gives him all of duties of State Board of Public Health.

A. B. 1216, by Rosenthal, by request (referred to Committee on Public Health and Quarantine). Establishes State Board of Public Health to act solely in advisory capacity. Fixes salary of Director at $10,000 per year.

A. B. 2107, by Dills (referred to Committee on Governmental Efficiency and Economy). Identical with A. B. 1215.

A. B. 2108, by Dills (referred to Committee on Governmental Efficiency and Economy). Identical with A. B. 1216.

S. B. 1054, by Kenny and Shelley (referred to Committee on Public Health and Quarantine). Identical with A. B. 1215.

S. B. 1055, by Kenny and Shelley (referred to Committee on Public Health and Quarantine). Identical with A. B. 1216.

S. B. 1217, by Powers (referred to Committee on Public Health and Quarantine). Requires health officers to report epilepsy.

S. B. Bills 1043 and 1044, by Nielsen (referred to Committee on Public Health and Quarantine). Requires health officers to report epilepsy.

Chiropody
(Four Bills)

A. B. 531, by Gannon (referred to Committee on Medical and Dental Laws). Requires one year of prechiropodical work of college grade.

A. B. 532 by Gannon (referred to Committee on Medical and Dental Laws). Relates to advertising.

S. B. 1083, by Jesperson (referred to Committee on Public Health and Quarantine). Identical with A. B. 531.

S. B. 1084, by Jesperson (referred to Committee on Public Health and Quarantine). Identical with A. B. 532.

Chiropractors
(One Bill)

A. B. 2176, by Reaves (referred to Committee on State Colleges). Relates to courses of instruction at Fresno State College, providing for instruction in advanced chiropractic and in school nursing, and making an appropriation.

Codes
(One Bill)

S. B. 657, by Mixter and Foley (referred to Committee on Public Health and Quarantine). Establishes a Health and Safety Code.

Compensation Act
(Seventeen Bills)

A. B. 419, by Rosenthal (referred to Committee on Labor and Capital). Adds persons on unemployment work relief program to definition of "employee."

[†] The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. George G. Reinle of Oakland is the chairman and Dr. George H. Kress is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. George H. Kress, Room 2004, Four Fifty Sutter Street, San Francisco.

[*] For additional Comment in this issue, see page 247 (first column).

A. B. 499, by Tenney (referred to Committee on Insurance). Increases benefits.

A. B. 500, by Tenney and Dills (referred to Committee on Insurance). Similar to A. B. 419.

A. B. 640, by Sawallisch (referred to Committee on Insurance). Adds pneumonia and heart trouble to "injuries" of police, fire and forestry department members for compensation awards.

A. B. 724, by Donnelly (referred to Committee on Labor and Capital). Excludes sheep shearers from definition of "employee."

A. B. 958, by Tenney (referred to Committee on Insurance). Amends Compensation Act, relating to inspection of medical records.

A. B. 1519, by Atkinson (referred to Committee on Insurance). Relates to payments.

A. B. 1520, by Atkinson (referred to Committee on Insurance). Inspection of x-ray films, reports, hospital and doctors' records, clinical, laboratory and other tests.

A. B. 1522, by Atkinson (referred to Committee on Insurance). Relates to disability.

A. B. 1526, by Atkinson (referred to Committee on Insurance). Brings farm employees under definition of "employee."

A. B. 1531, by Atkinson (referred to Committee on Insurance). Brings domestics and newsboys under definition of "employee."

A. B. 1696, by Gilbert (referred to Committee on Unemployment). Benefits for injured relief workers.

A. B. 2177, by Reaves (referred to Committee on Insurance). Employee entitled to select, without restraint, anyone licensed to treat in any manner the type of injury which he has sustained.

A. B. 2253, by Pelletier (referred to Committee on Insurance). Brings newspaper vendors under definition of "employee."

S. B. 250, by Foley (referred to Committee on Labor and Capital). Identical with A. B. 958.

S. B. 349, by Keating (referred to Committee on Labor and Capital). Relates to medical evidence in proceedings before Industrial Accident Commission.

S. B. 598, by Westover (referred to Committee on Labor and Capital). Relates to claims for Workmen's Compensation by State agencies.

Dentistry
(Ten Bills)

A. B. 1493 and A. B. 1494, by Meehan (referred to Committee on Medical and Dental Laws). Relates to the definition of dentistry.

A. B. 1707 and A. B. 1708, by Johnson (referred to Committee on Education). Relates to absence of pupils from school for dental services.

A. B. 1766, by Cronin (referred to Committee on Medical and Dental Laws). Requires applicants for licenses to practice dentistry to be citizens of U. S. A.

A. B. 1826 and A. B. 1827, by Hugh M. Burns and Cronin (referred to Committee on Medical and Dental Laws). Relates to registration of dentists and dental hygienists.

A. B. 2189, by Cronin (referred to Committee on Medical and Dental Laws). Relates to qualifications for practice of dentistry.

S. B. 989 and S. B. 990, by Carter (referred to Committee on Public Health and Quarantine). Relates to Dental Corporation of California, its organization, membership, government and powers, the practice of dentistry and dental hygiene.

Dispensing Opticians
(Four Bills)

A. B. 516, by Cronin (referred to Committee on Medical and Dental Laws). Establishes State Board of Dispensing Opticians.

A. B. 517, by Cronin (referred to Commmittee on Medical and Dental Laws). Relates to the business of dispensing optician.

A. B. 1666, by Sawallisch (referred to Committee on Medical and Dental Laws). Relates to persons engaged in and training for the vocation of optical dispensing.

S. B. 1226, by Jerperson (referred to Committee on Governmental Efficiency). Identical with A. B. 1666.

Health and Hospital Insurance
(Fifteen Bills)

A. B. 610, by Kepple (referred to Committee on Judiciary Codes). Relates to hospitals eligible to enter into contracts under nonprofit hospital service plans.

A. B. 1573, by Hugh M. Burns (referred to Committee on County Government). Relates to care and treatment at county expense of persons requiring the same.

A. B. 1711, by Johnson (referred to Committee on Insurance). Relates to insurance corporations issuing hospitalization, medical and dental benefits.

A. B. 1712, by Johnson (referred to Committee on Insurance). Nonprofit hospital service plans.

A. B. 2101, by Desmond (referred to Committee on Insurance). Relates to powers of boards of supervisors to adopt a system of life, health and accident insurance for the benefit of county employees and to pay the whole or any part of the premiums thereof.

A. B. 2103, by Desmond (referred to Committee on Insurance). Same provisions of A. B. 2101 to apply to governing bodies of school districts, municipal corporations, political subdivisions, public corporations and other public agencies of the State of California.

A. B. 2172, by Rosenthal, Atkinson, Dills, Gilmore, Cassidy, Kilpatrick, King, Del Mutolo, Collins, Hawkins, Gilbert, Gallagher, O'Day, Richie and Voigt (referred to Committee on Unemployment). Provides a system of health insurance within the system of unemployment reserves.

A. B. 2349, by Sheridan (referred to Committee on Insurance). Relates to forms of disability insurance policies which may be issued.

A. B. 2494, by Garland (referred to Committee on Insurance). Provides for regulation of insurance against the need for medical and hospital service.

A. B. 2501, by Garland (referred to Committee on Insurance). Companion measure to A. B. 2494.

S. B. 548, by Hollister (referred to Committee on Insurance). Relates to nonprofit hospital and health service plans.

S. B. 551, by Hollister (referred to Committee on Labor and Capital). Amends Labor Code to provide statewide system of health insurance.

S. B. 1128, by Kenny and Shelley (referred to Committee for Social Security, Pensions and Relief). Identical with A. B. 2172.

S. B. 1171, by Nielsen (referred to Committee on Governmental Efficiency). Identical with A. B. 2103.

S. B. 1172, by Nielsen (referred to Committee on County Government). Identical with A. B. 2101.

Hospitals
(Three Bills)

A. B. 1727, by Pelletier (referred to Committee on Judiciary General). Relates to hospital records.

A. B. 2385, by Meehan (referred to Committee on Hospitals and Asylums). Provides for inspection and regulation of private hospitals, sanitariums, homes for orphan children, nursing homes, homes for aged persons and similar institutions.

A. B. 2499, by Garland (referred to Committee on Social Service and Welfare). County hospital bill.

Health Officers
(Two Bills)

A. B. 444, by Evans (referred to Committee on Public Health and Quarantine). Relates to city and county health officers).

A. B. 2367, by Hugh M. Burns (referred to Committee on County Government). Relates to powers and duties of county health officers.

Insane
(Eighteen Bills)

A. B. 719, by Lore, Doyle, Lyon and Tenney (referred to Committee on Social Service and Welfare). To provide an institution for the confinement, care, training and rehabilitation of defective or psychopathic delinquents.

A. B. 2323, by Daley, Cassidy, Massion, Voigt, O'Day, Andreas and Richie (referred to Committee on Hospitals and Asylums). Designates Department of Institutions and the director thereof as the Department of Mental Hygiene and Director of Mental Hygiene and providing for his qualifications.

A. B. 2324, by Daley, Cassidy, Massion, O'Day, Voigt, Andreas and Richie (referred to Committee on Hospitals and Asylums). Amends code relating to epileptic and feeble-minded persons.

A. B. 2325, by Daley, Cassidy, Massion, O'Day, Voigt, Andreas and Richie (referred to Committee on Hospitals and Asylums). Relates to persons employed in State hospitals.

A. B. 2326, by Daley, Cassidy, Massion, O'Day, Richie, Andreas and Voigt (referred to Committee on Hospitals and Asylums). Relates to notice to creditors.

A. B. 2327, by Cassidy, Massion, O'Day, Richie, Andreas, Voigt and Daley (referred to Committee on Hospitals and Asylums). Relates to insane and incompetent persons.

A. B. 2328, by Cassidy, Massion, Richie, Andreas, O'Day, Voigt and Daley (referred to Committee on Hospitals and Asylums). Relates to insane defendants in criminal cases.

A. B. 2331, by Cassidy, Massion, Richie, O'Day, Andreas, Voigt and Daley (referred to Committee on Hospitals and Asylums). Relates to private institutions for the care of insane or incompetent persons.

A. B. 2334, by Cassidy, Massion, O'Day, Richie, Andreas, Voigt and Daley (referred to Committee on Hospitals and Asylums). Relates to support of persons confined in State hospitals.

A. B. 2335, by Cassidy, Massion, O'Day, Voigt, Andreas, Richie and Daley (referred to Committee on Hospitals and Asylums). Relates to transfers of inmates between State homes for feeble-minded and to support of inmates so transferred.

A. B. 2336, by Cassidy, Massion, O'Day, Richie, Andreas, Voigt and Daley (referred to Committee on Hospitals and Asylums). Relates to the acute psychiatric hospital.

A. B. 2337, by Cassidy, Massion, Richie, O'Day, Andreas, Voigt and Daley (referred to Committee on Hospitals and Asylums). Relates to insane persons.

A. B. 2603, by Cronin (referred to Committee on Governmental Efficiency and Economy). Appointment of Secretary of Department of Institutions as guardian or administrator.

S. B. 382, by Kenny (referred to Committee on Social Security, Pensions and Relief). Relates to maintenance of persons mentally disordered and bordering on insanity but not dangerously insane.

S. B. 524, by Kenny (referred to Committee on Hospitals and Asylums). Companion measure to A. B. 719.

S. B. 526, by Kenny (referred to Committee on Hospitals and Asylums). Relates to private institutions for mentally ill or deranged persons.

S. B. 769 and S. B. 770, by Deuel (referred to Committee on Judiciary). Relates to the plea of insanity and proof thereunder.

Medical Practice Act

(Seventeen Bills)

A. B. 437, by Doyle (referred to Committee on Medical and Dental Laws). Relates to signs and advertisements in connection with the practice of medicine.
